Elsewhere in East Africa, Julius Nyerere, President of Tanzania, was invoking similar sentiments about the expectations of politicians from the university, while being installed as the first Chancellor of the university of East Africa. He noted:

The University Colleges which comprise this University cannot be islands filled with people who live in a world of their own, looking on with academic objectivity or indifference at the activities of those outside. East Africa cannot spend millions of pounds, cannot beg and borrow for the university, unless it plays a full and active part in the urgent tasks of East Africa. Even if it were desirable, we are too poor in money and educated manpower to support an ivory tower existence for an intellectual elite. Our problems will not wait. We must, and do, demand that this University take an active part in the social revolution we are engineering.

The Reporter (1963: 29).

Nyerere returned to the specifics of what he thought of a university in Africa and the purpose of academic freedom, while inaugurating the University of Dar es Salaam in 1970. He said:

Having made clear why we are establishing it, and what we expect from it, and having done our best to select administrators and teachers capable of fulfilling our intentions, we have then to trust those we employ and those we select to attend it. We can watch and warn. We can demand that they should explain what they are doing and why—and we can tell them to change if that is necessary! We can instruct the staff to examine themselves and their work every year—to conduct “post-mortems” with the students at the end of every course ... But we should be stupid to try to bind the University staff hand and foot, move them like puppets. The University must be allowed to experiment, to try new courses and new methods. The staff must be encouraged to challenge the students and the society with new arguments, and to put forward new suggestions about how to deal with the problems of building a socialist Tanzania based on human equality and dignity. Further they must be allowed, and indeed expected, to challenge orthodox thinking on scientific and other aspects of knowledge ... Only by allowing this kind of freedom to our University staff will we have a University worth its name in Tanzania ... For University of Dar-es-Salaam will be able to serve out socialist purposes only we accept that those whom we are paying to teach students to think, must themselves be allowed to think and speak their thoughts

Ranger (1981: 17–18).

While Nyerere’s speech sounded accommodative to some degree of academic freedom, his later statements signaled what would later turn to be the political understanding and demarcation of the limits to academic freedom in the universities. During the inauguration of the University of Dar es Salaam in August 1970 Nyerere explained that “the aim of the university of Dar es Salaam must be service to the needs of developing socialist Tanzania. This purpose must determine the subjects taught, the content of the courses, the method of teaching, and the manner in which the university is organized, as well as its relations with the community at large” (Schutte, 1972: 75). Henceforth, Nyerere sought to have firm political control of the university to drive his socialist political vision for Tanzania. The university whose establishment had started from the headquarters of the Tanzania African National Union (TANU) in 1961 (Tanisha, 2007), increasingly experienced entrenched political control of its academic and administrative processes especially after its inauguration as a national university in 1970. The first vice-chancellor of the university, Pius Msekwa, was a former executive secretary of TANU, despite the fact that he lacked the academic experience for such an appointment and in a context where there were qualified academics deserving of such an appointment (Omari, 1991). The confrontation between the academics and students of the university on one hand, and the political elite on the other in the 1970–1980 decade emanated from a desire from academics and students to resist encroachment on their academic freedom by a political elite that wanted to create a subservient university and academic community that followed and obeyed political party and government policies without overt contradictions (Nkulu, 2005).

Nyerere was not alone in these deepening of the state control of universities as a strategy to realize the kind of “development” they dreamed of the new nations. In Ghana, Kwame Nkrumah, bent on using the university to achieve his socialist vision, and suspicious that the University of Ghana would not play along, established a new institute at Winneba to facilitate the control of intellectual life by him as president, and by extension the Convention Peoples’ Party, CPP (Serra and Gerits, 2019). The institute at Winneba housed the Kwame Nkrumah ideological Institute (KNII) with university level status despite the protestations from the National Council for Higher Education advising that the KNII did not fall within either UNESCO’s definition of higher education or the Ghana Education Act and that it therefore should be ranked as a technical school (Serra and Gerits, 2019: 413).

It was after Nkrumah had been overthrown as president that academics and university administrators had the courage to come out and lament how politics had been allowed to override the core tenets of academic freedom at the universities. The excerpts below from the address by the vice-chancellor, of the University of Ghana, Dr. Alexander Kwapong, to the Congregation of the

University of Ghana on March 26, 1966, does show the extent the political establishment had defiled and limited the quality of academic freedom at the university. He said:

... this institution has been subjected to the most merciless and persistent attacks by the regime of Kwame Nkrumah ... In this university, with its substantial body of scholars recruited from all over the world and dedicated to the pursuit of truth, scholarship and research, unfettered by any foreign ideology or creed and enjoying academic freedom, Kwame Nkrumah and his henchmen, it was quite obvious, saw one of the most powerful obstacles to the realization of his despotic ambitions ... It was said by the critics of this university that academic freedom was a luxury which Ghana in its bid for rapid development could ill afford ... a shibboleth behind which imperialist, colonialist and neo-colonialist agents and their stooges sheltered, and in the rapid march towards the new socialist paradise and African unity, there was no place for this outworn bourgeois concept ... You may recall that the Institute of Education was arbitrarily removed from this university by the government without any substantial consultation of the university, against the responsible and reasoned objections of the academic body of this university, subsequently vindicated by events ... Not that enough damage had not been done by this time ... In 1964, this university was shaken by the deportation of six of its senior expatriate members (one of whom was subsequently invited back by Nkrumah to be a presidential professor!) and by the detention of a Ghanaian senior member and of a student and the invasion of the campus by a horde of C.P.P hooligans. The attempt, however, to turn this place into a C.P.P university and an instrument of Nkrumah's will was to have reached its climax this academic year when, with a dedicated party member and intellectual confidant of the ex-President installed as pro-vice-chancellor, a determined effort was to have been made to storm, once and for all, the Legon Bastille.

Excerpts from speech of the vice-chancellor, University of Ghana, 26th March 1966.

The nature and status of academic freedom in the universities could not however be simplistically dichotomized as one that pitied the political class on one side and the academics and students on the other. Nor were the interests at play nuanced and categorized along compacted lines, between those that were exercised by the politicians and representing the nationalist and popular interests of the African people and what was portrayed as "ivory-tower" interests of academics articulated in the language of academic freedom. Often the interests of politicians and the nascent African academics converged, especially among a group of African academics that sought political patronage to seek promotion and take over academic and administrative leadership positions from expatriates. Politicians, and especially the country presidents on the other hand, used their positions as Chancellors of the new universities to manipulate expatriate academics to support positions that eroded the quality of academic freedom especially of African academics that were considered recalcitrant. The appointment of an expatriate academic to the position of presidential professor by Nkrumah, as quoted above was an example of such a manipulation. The intimate manipulated relationship that emerged between expatriate academics who sought security of their contracts and African political regimes on one hand, and on the other nascent African academics posturing as nationalist intellectuals in exchange for political patronage as a strategy for academic promotions and appointment to university administrative positions set in motion a process of progressive and substantial erosion of university autonomy (Coleman, 1977). While security of tenure and deserved academic promotions are considered essential to academic freedom, political regulation and interpretation of what security of tenure and academic qualifications entailed started to be increasingly applied by co-opted university administrators to force compliance by expatriate staff and their African accomplices to curve in to the governments designs of the university (Crawford et al., 1967). Evidence suggests that a number of African academics supported the designs by the state, accepting limited conditions for academic freedom and institutional autonomy in preference for greater state involvement in institutional governance when this suited their immediate objectives (Mamdani, 1993).

The period 1960–1980, witnessed the nationalization of universities and the borrowing of a template from the colonial universities by independent governments to progressively deepen the erosion of academic freedom and institutional autonomy. The increased steering role of independent African governments, which often constituted what has been captured as the threats to academic freedom and institutional autonomy started as a genuine desire by the political elite to drive their vision of national independence and African development through the universities and the creation of an African intellectual elite to support this process. Certainly, the understanding of the political class during the 1970–1980 decade was that political infringement on academic freedom was the necessary political direction that universities needed as part of national planning, and which was considered primary, while the degrees of academic freedom that the universities required remained a matter of discretion.

1980–2000: corporatization of universities and undermining of conditions for academic freedom

Corporatization in regard to higher education in Africa has been loosely used to refer to the period particularly after 1990 when governments' direct involvement in the governance of universities begun to recede and was replaced with new bodies and business management logics and practices. Corporatization begun in the mid-1980s when the World Bank, in response to the economic crisis of the African state urged governments to implement economic structural adjustment interventions to improve the quality of public services, including universities through the deployment of new management practices, including commodifying and commercializing the spaces as a strategy to improve efficiency and effectiveness. The logic of the "developmental university" as established in 1970 was replaced with institutions that were referred variously as "corporate", "entrepreneurial" or "Transformational" universities (Rhodes, 1994; Pryor et al., 2014). The universities, with new governance bodies, were encouraged to explore alternative sources of funding their operations as governments gradually reduced public resources into the universities. These new arrangements, as will be discussed in the last section of this article, also redefined conceptualizations of academic freedom and institutional autonomy, at least from the core constituencies-academics, students and the management of higher education institutions.

The 1980–2000 decades when the governments began implementing the Structural Adjustment Programs witnessed extreme violations of academic freedom throughout the continent, compared to the previous decade. The violations peaked in reality from 1990 as the institutions commenced domestication of the structural conditions provoking resistance from academics and students. In 1991, a Report on academic freedom in Africa by *African Watch* (1991), documented about 158 extreme violations of academic freedom targeting academics and students, including the detention without trial of students and academics across 16 African countries. The nature of violations included arbitrary abrogation of the rights of academics and students to assemble and articulate grievances against university authorities or the government, withdrawal of travel documents from academics, withdrawal of citizenship and resident permits from foreign academics, violent breakup of peaceful demonstrations resulting in deaths of academic staff and students, monitoring of teaching spaces and denial of research permits and a gross amendment to the Acts governing universities without due consideration to the views of students and staff. In Nigeria alone, about 2000 academics from 7 universities were sacked by 1999, accused of teaching what they were not paid to teach (*Committee for Academic Freedom in Africa CAFA*, 2002). Between 1986 and 2001, about 139 students and 6 lecturers from various universities had been killed from police brutality and about 400 students remained expelled from their studies or rusticated because of participating in various acts of resistance against the government's undermining of university education (*CAFA*, 2002). The Nigerian situation largely mirrored what was happening elsewhere in Africa. Between 1999 and 2001, acts of student struggles against structural adjustment, often resulting in the killing of students, closure of institutions, abolition of student's organizations, arrest and detention without trial of students' leaders and the academics who supported them, were recorded in 26 universities across the continent (*CAFA*, 2003). Cumulatively, these actions greatly exposed the independence of the Universities to government interference and allowed vice-chancellors as government appointees to enforce the will of the governments within the institutions with little regard to the intellectual rights of students and staff. Academic staff unions, where they existed and operated in countries like Kenya and Nigeria were banned as a way of dealing with what was considered as dissent from mass organizations that had the capacity to mobilize opposition to the World Bank reforms (*African Watch*, 1991).

Why did governments clampdown on universities and academic freedom in Africa intensify and turn more violent in the 1980–2000 decades compared to the previous 1970–1980 decade? The explanations lie in the structural adjustment economic reforms that governments in Africa were forced to implement by the World Bank and other donor countries. The reforms offered double edged swords both to the governments and universities. Amid declining resources to support universities at a time demands for access to universities peaked all-over the continent, governments sought to force unpopular reforms in the universities, including reduction of the annual intake of students to the institutions. This was given the business-language of rationalization. The resistance to the reforms from better organized urban elites that included university academics and students, also included pressures for liberalization of politics in ways that threatened the one-party states in Africa and the incumbent regimes. Hence, while implementing the reforms assured cash-strapped governments of credit lines from the World Bank and other donors in the short-term, implementation of the reforms in the medium to the long-term created a situation where the governments authored the path of their exit from power. Such double-edged policies required, and indeed did manifest a higher degree of authoritarianism in their enforcement especially toward organized groups that fronted the greatest resistance to their implementation (*Ibhawoh*, 1999). Academics were seen as constituting political resistance beyond the call of academic freedom and institutional autonomy, and university spaces were seen as convenient for covert political organizing in an environment where political organizing in public spaces was highly restricted and monitored. Governments had to deploy violence and gross violation of human rights to implement the World Bank conditions and meet conditions for the promised loans while at the same time resisting pressures for political liberalization.

The suspicion of African governments that academics were engaging in politics aimed at what came to be referred as "regime change" and not raising issues of academic freedom was heightened by the support that academic freedom organizing in the continent began to receive from external neo-liberal academic organizations. These included, for example, the Committee for Academic Freedom in Africa (CAFA) established in 1980, but activated in 1990 to respond to the crisis occasioned by SAPs in African universities; The Association of Concerned African Scholars; the American Association for the Advancement of Science's Committee on Scientific Freedom and Responsibility; Human Rights Watch and African Watch. Jointly or individually, the organizations supported the quest for academic freedom in Africa, including financial support for establishing academic staff unions, highlighting the adverse effects of SAPs to higher education in the continent and exposing the extent of state violence on academics and students who were resisting the state's misadventures in higher education (*African Watch*, 1991; *Federici and Caffentzis*, 1991).

On the positive side, and despite the extreme academic and human rights violations, the 1990s witnessed the realization of an attempt for a decolonized articulation of what constituted academic freedom and institutional autonomy in African universities. In the face of rising abuses of academic freedom across the continent, two documents were produced that served as a guide to the struggle for better spaces for academic freedom as well as a nuanced understanding of the responsibilities and expansiveness of the rights and responsibilities of academics in Africa. The first was the Dar es Salaam Declaration on Academic Freedom and the Social Responsibility of Academics, which was adopted on April 19, 1990, when 12 delegates from autonomous staff associations from higher education institutions in Tanzania convened in Dar es Salaam. The second was the Kampala Declaration on Intellectual Freedom and Social Responsibility that resulted from a Symposium on Academic Freedom and Social Responsibility of Intellectuals convened by the Council for the Development of Social Science Research in Africa (CODESRIA) in Kampala, Uganda on November 29, 1990. The two declarations, while addressing the rights and freedoms of academics to teach and research, also point out to the responsibilities and duties that should accompany such freedoms and for which academics owe to society at large. In articulating

this position, the declarations emphasize the point that universities are not only sites for knowledge production but also of social commitment (Chachage, 2006), within which academics have a duty to contribute toward redressing historical and contemporary inequalities in society based on differences of class, beliefs, gender, race, nationality, region and economic conditions' (Dar es Salaam Declaration, 1990). The declarations do caution academics against hiding behind the veil of academic freedom to engage in unethical behavior and urge the basis of social responsibility to be justified by a commitment to objective science and the promotion of the compact between academic work and society. Article 19 of the Kampala Declaration notes that ... members of the intellectual community are obliged to discharge their roles and functions with competence, integrity and to the best of their abilities. They should perform their duties in accordance with ethical and highest scientific standards. As will be discussed in the last section of the article, this call to ethical and social commitment for academics in Africa means contextualizing the exercise of academic freedom within the context of African struggles for intellectual colonization and subverting the hierarchies of region, ethnicity, gender and race (Badat, 2009).

The expansive conceptualization of academic freedom for Africa as articulated by the two declarations has become untenable to realize. As shall be discussed in the last section of these article, the neo-liberal conditions implemented in African universities have resulted to the emergence of university spaces where the social commitment of academics is compromised by practices of managerialism, commitment to profits and individual material well-being. Rather than promoting inclusiveness and equity, universities have become centers for the reproduction of all sorts of social inequalities, with the full acquiescence of academics.

Embracing support from Western Neo-liberal institutions and supporting part of the World Bank sanctioned conditions in the higher education sector also had its underside to the evolution of genuine spaces for academic freedom in African universities. The reforms proposed by the World Bank and backed by western neo-liberal thinking including introduction of user fees in the financing of universities, reduction of unit costs, and shrinking of public sector participation in favor of the private sector (World Bank, 1988) contributed to eroding gains that had been realized in the development of the university sector in the 1970–1980 decade. Underfunding of the institutions through reduced public support meant declining terms of service, and deterioration of working conditions in ways that legalization of staff and students unions would not help alleviate. Hence, and as highlighted in the introduction to this chapter, though staff and student unions were legalized and the state's direct involvement in the governance of the institutions reduced, the conditions for academic work deteriorated.

As literature has documented, the World Bank reforms produced contradictory outcomes that by the end of the 1990s had negatively affected the institutions as academic institutions. On one hand, universities privatized some sections, including student streams which increased university revenues and staff remunerations. On the other hand, students from poor families were excluded from the institutions unless on dwindling government subventions. This fractured the traditional solidarity between students and their lecturers and among lecturers themselves as priority was put on market forces that considered education as a commodity offered to individual consumers who could afford it, thus moving the bases of solidarity from academic collegiality to business-like customer-client relations. There was also an increasing view of academics as wage-laborers whose wages depended on the financial status of the institutions and were thus obliged to compromise their freedom for a salary and research funding, leading to the general deterioration in the quality of teaching and learning in the institutions (Federici et al., 2000; Sawyer, 2004; Oanda, 2011; Ochwa-Echel, 2013; Yann and Oanda, 2020).

Post-2000 developments: intensity and quality of academic freedom in African universities

As discussed in the first section of this article, the restraints to the exercise of academic freedom have largely been eliminated in most of the countries. Academic freedom is recognized as a right in the constitutions of most countries, student and staff organizations have been allowed to operate, and in some countries, they are included as part of the governance structure of the institutions. Certainly, some of the old aspects of restraint to academic freedom still occur in a number of countries. In Cameroon, for example, academics have been entangled in the political tension between Anglophone and Francophone regions to an extent that academics' liberties to undertake research, teach or communicate ideas or facts that are inconvenient to the political establishment lose their jobs and are sometimes detained (Ngoh, 2021). On April 20, 2019, the minister of higher education of Cameroon caused authorities of the University of Buea to suspend classes of Agbor-Balla, a law lecture alleging the lecturer had breached the university's code of ethics and conduct (Human Rights Watch, 2019). According to the lecturer, the reason for the cancellation was because of an assignment he had given students requiring the students to explore the reasons behind the Anglophone crisis, to gauge how critical the students would engage with the assignment (Human Rights Watch, 2019). In Egypt, the military coup in 2013 did trigger a situation where universities became militarized as the military stifled any dissent from the universities (Saliba and Grimm, 2016). The Association for Freedom of Thought and Expression (AFTE) in Egypt documented 2138 violations of students' rights between 2013 and 2016, including 21 extrajudicial killings and 1181 student arrests (Saliba and Grimm, 2016). The Arab Spring also did trigger widespread political control over and censorship in higher education and research throughout North Africa's universities (Saliba and Grimm, 2016). At Makerere University, Uganda, 45 members of the academic staff were dismissed in December of 2019 over what university authorities said was an enforcement of discipline, but which the academics thought was a case of university authorities being used to silence academic thought to be opposed to the

administration of the country's president (<https://www.dw.com/en/ugandas-makerere-university-at-center-of-row-over-academic-freedom/a-47310962>). In Rwanda, the government continues to restrict academic freedom through the enforcement of particular views on the genocide and questions of political rights forcing academics and students to engage in self-censorship to avoid punitive reactions from the government (Freedom House, 2021). On August 14, 2020, the University of Rwanda (UR) dismissed professor Aimable Karasira in apparent retaliation for public expressions critical of the government (Scholars at Risk, 2020).

Despite the continued existence of the old external restrictions to academic freedom, the most worrisome abuses are coming from within the universities and involve its core constituencies, academics, students and management of the institutions. One adverse consequence of the World Bank conditions implemented in the universities was that by the end of the 1990s, reduced government investments in the universities had resulted in the collapse of the basic infrastructure for academic work making a mockery of the space for academic freedom that had been extended to the academics. Academic freedom and academic responsibilities are rights that can only be exercised in a context where conditions for good academic work and social engagement exist. The logic of the new governance frameworks that emerged in the institutions was however undermined by the realization of these conditions.

The new higher education governance frameworks that replaced governments had to design market like strategies for generating institutional revenues in ways that brought new challenges to the exercise of academic freedom. The reforms were driven by financial considerations and the logics of the market which reduced public funding to the institutions and undermined public accountability of higher education systems, and the economic prerequisites for academic freedom and social responsibility (Mama, 2006). Henceforth, issues of academic freedom begun to be articulated at the level of economic interests of both students and academics, and how the sharing of dividends from commercialized university activities would be shared between the institutions and academics and the management of institutions. Tensions between academics and university management have been limited to strikes over low salaries or non-payment of the same, or disagreement of how internal revenues generated by the universities have to be shared between the institutions and academics within the understanding of the market principles of profit sharing and the relationship between clients and customers.

Lack of investments in renewing teaching-learning infrastructures has also led to a neglect of an important component of academic life-the quality of students' services in the institutions. Implementation of the World bank reforms was supposed to lead to better learning environments. However, with university planning heavily borrowing from business models, little resources were spent to set up new facilities and improve existing ones. This is despite the fact that most institutions in countries that had introduced tuition fees resorted to increasing the intake of students as a strategy to generate more revenues for the institutions. By 2002, CAFA documented the growth of cults among students across Nigerian Universities shrouded in religious practices that resulted in the death of students and abandonment of academic life. Studies have documented the poor conditions of student facilities including overcrowding of, limited skills and capabilities of facility management departments, and lack of financial resourcing for better facilities across public universities in Africa to the extent that quality of the learning and teaching environment at the institutions has collapsed (Chikafalimani et al., 2021). The post-2000 period has witnessed the total triumph of the market logic, individualization of student grievances, fractured the collegiality between students and academics, as academics have opted for calm to make extra income from "unyielding clients (students), and the overall criminalization of any student grievances by university authorities" (Chikafalimani et al., 2021).

On the other hand, the frequent strikes by academics over salaries and closure of institutions also continue to accentuate the suffering and financial demands on students and families. Frequent university closures lengthen the time to graduation for students. There has also been an increase on the number of unethical behavior on the part of academics reported across the continent, including academics engaged in "degree mills" as a source of alternative income, selling grades for sex and other forms of unethical behaviour that cannot be defended by invoking the safeguards to academic freedom, although academic staff unions have invoked such rights for their members (Hallak and Poisson, 2007; Kirya, 2021). Often in resorting to strike action in furtherance of their quest for better salaries and terms of service, academics have ended trampling on the very right to academic freedom as the right of academics to strike action undermines the right of students to learn (Mamdani, 2019). Universities, operating on market logics may have also resorted to employing to full-time positions junior academics with only masters' degree qualifications, a category that should be on staff training and mentorship. Employing a large number of such academics and giving them full-time academic responsibilities may have compromised the standards and quality of academic freedom as such academics have not matured to appreciate the full burden of what academic freedom and social responsibility entail. By 2020, it was estimated that the proportion of academic staff having a Ph.D. in African universities rarely exceeded 40% and, depending on the country and the subject, the ratio would be as lower as 20% (Mohamedbhai, 2020).

How would the persisting and in some instances the deterioration of academic freedom and social responsibility of academics be explained in the context where most of the limitations imposed by governments have been removed and the right to academic freedom enshrined in most constitutions? In the first instance, it should be noted that governments vacated their governance roles together with the public funding responsibilities that secures the conditions for the exercise of academic freedom. Granting academics, the constitutional right to academic freedom, but abdicating the responsibilities for securing the conditions for the exercise of such freedoms to the vagaries of the market amounted to what Isaiah Berlin (Berlin, 1969) has conceptualized as the negative dimension of academic freedom. In this respect, constraints to the exercise of academic freedom such censorship, non-interference in teaching and research, the freedom of academics to take part in public discourses and the freedom to form and belong to

academic unions are legally guaranteed in most African universities. But the institutional mechanisms or enablers that facilitate academics to exercise the choices were hollowed out by the reforms governments implemented and the abdication of their realization to market forces. Academics would for example access research funds if only they tweaked their research engagements to address certain market needs outside considerations of objective knowledge and needs of society. The deepening of the neoliberal structures in the institutions and the reconfiguration of internal institutional organs of governance has resulted to situations where the governance organs have become antithetical to accommodation of academic freedom and institutional autonomy as traditionally understood. There is also a continuing surrender by academics of their intellectual authority to market forces, on issues of deciding what to teach and surrendering this to be determined by bodies outside the universities. The recourse to engaging a high number of academics who have not fully attained academic ranks has accentuated trends toward widespread unethical behavior and subversion of the conditions for academic freedom from within the institutions. The full exercise of academic freedom requires not only the absence of certain social relations of prevention but the presence of abilities and capabilities (Sen, 1993).

Conclusion

The excessive interference of governments or government functionaries in the academic affairs of universities is often cited in the literature as an example of what went wrong with universities in Africa from the 1990s. This article, by analyzing some historical literature has shown that government control of the institutions was an aspect that was built into the administrative logic of the institutions at a time they were established as university colleges during the colonial period. In the case of British colonial Africa, the secretary of state through the governors of the various colonies exercised this control. In 1970, when the universities were transformed into national institutions, the presidents of various African countries took over the levers of control and sought to use the institutions as vehicles for decolonization narrowly defined. The last in this approach is South Africa which post-1994 has tried to exert government control over the universities to achieve “transformation”. The worst excesses in academic freedom abuses in Africa were however witnessed from 1990 as African governments were arm-twisted to enforce the will of the World Bank in restructuring the universities. From 2000 to-date, literature does suggest that market conditions, pliant university management and an academic staff who have acquiesced to the logic of the market have largely contributed to hollow out requisite conditions for the exercise of academic freedom in African universities.

Introduction

Academic libraries, like higher education institutions, have multiple missions. They preserve information, provide that information to members of the institutions they belong to, and help people find and use that information. They serve both the highly specialized research needs of advanced scholars and the large volume of routine learning needs of undergraduate students. They also provide study spaces for students and access to hardware and software for learning and scholarship. While the missions continue, the mechanisms for executing the library's missions have expanded in the digital age. Preservation involves not just caring for aging paper and maintaining technology for using various audio-visual formats, but storing digital copies of information resources in various file types. Access entails both shelf maintenance and online resource architecture management. Instruction can be both face-to-face and virtual in the form of websites, video, and online chat.

Organization of libraries

Library Deans or Directors often report to the university provost. Where the library is seen as a peer to the teaching colleges, the title is often Dean, whereas libraries viewed as support services often have Directors (Hoffman, 2017). A Dean may be supported by Associate Deans and department chairs and a Director may be supported by department heads. The functions of academic libraries have traditionally been divided into the public services division and the technical services division.

What are public services?

The public services divisions of libraries are the personnel who interact with patrons. This includes instructional librarians, circulation staff, and staff to aid with technology such as printers and audiovisual equipment. Public service librarians serve patrons, teach students about information use, work with faculty members seeking information, and in large libraries, they often have specific subject specialties. They used to have large collection development responsibilities, but the rise of journal subscription packages and databases has moved many collection development decisions away from individual subject experts and toward centralized acquisitions librarians (Uziel, 2017). Instead, public services librarians spend more time teaching and reaching out to departments to keep them apprised of new resources. At large libraries, librarians no longer spend much time on reference desks, although they still answer questions referred to them by support staff or which come in virtually through email or chat. There is a trend toward consolidating reference and circulation desks so that simple queries and technology issues can be handled by circulation staff or student workers and librarians are called in only for complex questions (Forbes and Keeran, 2017).

There is decreasing demand for circulation of physical materials and for reference services, but increasing demand for library instruction. The area of library services where physical materials and reference support is still in highest demand is in special collections and archives, where many rare or unusual collections reside. Demand for print also continues in many developing nations where internet access is limited. Media production is a growing area of public service for academic libraries. Many academic libraries provide equipment and support for video and sound recording projects. Research data management and analysis are also growing areas of public services.

What are technical services?

Technical services units cover a wide range of activities that serve patrons either directly or indirectly. Broadly speaking, these functions consist of acquiring materials, licensing, managing electronic resources, managing finances, resource sharing, systems, metadata and cataloging, processing, or preservation and conservation. Common technical services unit names in the library include acquisitions, metadata, project management, negotiation, resource management, document delivery and interlibrary loan, or conservation. These core functions serve as the mostly hidden infrastructure that supports and facilitates the overall work of the academic library (Ciota and Knight, 2020).

Technical service functions continue to change as academic libraries evolve. The demand for electronic resources continues to grow and presents ongoing challenges. There are a number of models to acquire these resources through on-demand acquisition, purchase plans, firm orders, or leased materials. Each provider and publisher has a variety of models and ways to access electronic resources. This variety combined with sometimes predatory practices on the part of providers and publishers make for an often confusing user experience (Beall, 2009). In the realm of cataloging, the trend is to speak more of metadata. This highlights technical work with data of all formats that is used to contextualize resources for users. Metadata form the basis from which systems exchange and share information for users and by which users discover, search, find, and identify resources. The major change here is the re-focusing of work away from records and managing documents to metadata that is shared, exchanged, and managed in network environments (Long, 2020).

Library personnel

Library personnel are a diverse group, at least as diverse as faculty. They serve all the disciplines faculty serve, requiring specialist knowledge in every subject. They are not united by common duties of teaching or research as the teaching faculty are. They may belong to different unions, for example, with subject liaison librarians in a faculty union, computer programmers in a professional staff union, and circulation clerks in a clerical staff union. Libraries in North America and Europe increasingly prefer to hire PhDs for specialist librarian positions beyond or instead of a Master of Library Science (Brunner, 2010), and library personnel may have a variety of other degrees in subjects such as computer science, business, or law. Librarians in Asia, Africa, and South America sometimes hold bachelor's degrees rather than master's or doctoral degrees.

Library personnel numbers are decreasing and there is a trend toward hiring more librarians and other professional personnel and fewer clerical staff and student assistants (ARL, 2021) as can be seen Fig. 1. This is due to the increasing needs for library services like electronic resource management and information literacy instruction and the decreasing use of print materials which previously necessitated a lot of physical processing and maintenance. The overall decline in personnel numbers is at least in part a result of the decrease of library funding as a proportion of university spending. Growing librarian roles include data management, scholarly communications, digital humanities, geographic information systems, user experience, and assessment. The library profession is overwhelmingly white and the underrepresentation of black and Hispanic people in librarianship is problematic for serving an increasingly diverse student population (Brunner and Osario, 2017).

Librarians at some institutions have faculty status (Hoffman, 2017). This means they have scholarship and service requirements as well as their professional duties to attend to. Many go through a tenure or equivalent process. This sometimes creates tension at universities because librarians have both the demand for scholarly innovation like teaching faculty and the expectation of

Fig. 1 Changes in average staffing of ARL libraries.

completing their professional duties 12 months a year, unlike teaching faculty. It is easy to overlook the research productivity of librarians since they also have practical responsibilities to support their institutions. The large number of academics searching for tenure positions means some PhDs find roles in the library which answer their career goals and employ their expertise as subject specialists to serve universities beyond the teaching departments.

Library collections

What academic libraries collect changes with what scholars value. As academia shifts its values, library holdings shift to continue to serve their patrons. This means more resources reflecting minority voices, more digital resources, greater emphasis on articles than monographs, and collections which lean toward the subjects best supported by grant funding. It means library collections have expanded to include not just published articles, but conference presentations, data sets, and research software.

Individual institutional mission affects the aims of the library serving it. For example, at research intensive institutions, the demand tends to be for more journal packages and database subscriptions, while at liberal arts institutions the monographs prized by the humanities disciplines tend to be in higher demand (Budd, 2018). At teaching focused institutions, instructional materials are in higher demand than the newest research publications.

There has been a shift from collecting physical materials to providing access to both physical and digital materials, but both of these parts of the library mission remain important. Although much newly produced information is available in digital formats, need remains for information resources produced in physical formats, so libraries must balance multiple format demands. The challenge for libraries moving forward is to balance continued access to historical information resources with access to the current and emerging resources. This is too big a task for any single library, even the largest and most affluent. The way forward for libraries is collaboration and resource sharing. Libraries must share the burdens of housing and preserving resources and streamline the pathways for sharing resources beyond their home institutions.

The graph in Fig. 2 illustrates the proportion of resource usage by type for libraries serving doctoral granting universities in the Association of College and Research Libraries (ACRL, 2021). The usage displayed is an average for a group of over 300 US libraries. Notice that print circulation makes up only a small portion of usage for these libraries. Much more library usage comes from article downloads through library subscriptions and institutional repositories. Ebook usage is also a significant part of library use. In this case, ebook usage is represented as ebook article or section usage, so it is not straightforward to compare with print book checkout. While visiting patrons can use print and digital material while on campus, most circulation, ebook use, and subscription journal use come from patrons affiliated with the library's institution. In contrast, the articles and resources shared in an institutional repository (IR) are readily available to users both inside and outside the institution. In contrast to the traditional model of providing resources produced by scholars worldwide to a local audience, IRs reverse this model by providing resources produced by scholars at the local institution to a worldwide audience.

The globalization enabled by the web is in some ways leading to more localization in the work of libraries. When it is impossible and unnecessary to purchase or house the entire scholarly record, libraries must each concentrate on preserving and curating the scholarly record produced by the experts at their institution and making those resources available globally.

Fig. 2 Average usage by format at ACRL libraries.

Economics of information

Libraries are a form of collective ownership. Collective ownership of information facilitates more economical storage, use, and management of resources than individual ownership of information. Affordability of information resources is particularly important in the current higher education environment because of the growing costs of higher education. With efforts to make higher education accessible to everyone regardless of their economic circumstances, providing affordable access to the information resources required to succeed in higher education is increasingly important. The exponentially growing body of reputable scholarly knowledge is expensive to access. The body of free information available on the web is also growing rapidly, but consists of resources of varying quality. This makes the work of librarians and library personnel vital to higher education. The spectrum of higher education patrons from specialized scholars to beginning college students depends on the services of the library for access to and differentiation between information resources.

The market for scholarly publications is troubled. Libraries face stagnant budgets (Rauf, 2017) and the costs of providing access to scholarly information are increasing. Demand for scholarly information is inelastic. Scholars do not pay for the information they use, so their demand does not decrease with increasing costs. Library and university reputations depend on access to information, so for-profit publishers have few limits on how much they can charge. Studies have shown “the large commercial publishers routinely make a 35% to 45% profit margin on the scientific journal operations” (Lewis, 2016, p. 50). This is due in part to what is known as the “big deals” in which publishers bundle titles together, knowing that the majority of demand is for a minority of journal titles, leading libraries to pay for titles they don’t need to get titles they do need. Publishers argue that cost per title has not increased dramatically, while librarians point out that libraries and their patrons do not want or use most of the titles they pay for. Rising prices from the “Big 5” for-profit academic publishers has forced many libraries to sacrifice titles from independent publishers and limit staffing to reduce salary expenditures. Because much scholarly humanities literature is published by society presses or university presses, while literature in the sciences is often published by commercial publishers, the swing of funding toward the big commercial publishers particularly hurts the humanities.

The graph in Fig. 3 shows the proportion of spending on one time materials such as books, DVDs, and CDs, versus ongoing expenditures such as subscriptions to databases and journals (ACRL, 2021). The graph shows average collection spending per ACRL library at doctoral granting universities. Notice that ongoing expenditures far exceed one time expenditures.

Traditionally, libraries have not provided textbooks to students except on course reserves for a few hours. However, with the rise of online courses and ebooks, libraries are increasingly making efforts to provide digital textbooks for course support. When print publication was the norm, each volume produced and purchased had a cost. In the digital age, it costs the same to produce one copy of a document as it does to produce copies for everyone who wants one. However, in many cases, publishers continue to sell ebooks with digital restrictions to allow only one person or a few people to read them at a time instead of providing for unlimited users from an institution. This causes difficulty in universities where many students in a course are assigned to read the same text at the same time. Some libraries are involved in efforts to create Open Educational Resources which are free for unlimited students to use in their coursework (Owen, 2017).

Scholarly knowledge is a public good whose value goes beyond its use to academics to practitioners and policy makers in a wide variety of fields. To serve the public good, the scholars who produce the information are trying to disrupt the expensive market for scholarly knowledge. Particularly in the pure sciences, such as physics and biology, there are efforts to make access to scholarly research free. In addition to being part of the movement to disrupt the market for information resources for student learning, libraries are also a piece of the open access movement, helping scholars share their research through institutional repositories

Fig. 3 Average collection spending at ACRL libraries.

(Owen, 2017). Libraries also make the increasing amount of information available freely on the web more discoverable for scholars at their institutions (Faulkner, 2017).

To decrease the cost per use of materials, libraries have adopted more patron driven acquisitions, in which ebook purchases are made when patrons download, print, or read an ebook instead of items being selected and purchased by librarians before they are requested by a patron. Libraries also acquire print books when requests are made by scholars at their institutions, though this process takes more time to complete.

Library usage

Decreasing areas of demand in libraries include print circulation and reference. Increasing areas of demand include instruction, electronic article downloads, and ebook usage. The increased effort to provide instruction to students may be part of the reduction in reference questions. The role of library discovery systems (an interconnected search system that patrons use to search various library resources) as a finding tool is high but decreasing while the use of libraries for access to collectively purchased content is increasing. The graph in Fig. 4 shows the decreasing average searches of electronic library resources and the increasing average of article downloads at libraries that are members of the Association of Research Libraries, a group of over 100 research libraries in North America (ARL, 2021). The decrease in searching using library discovery systems suggests growing reliance on search engines for discovery of resources funded by libraries for their patrons.

The trend toward using search engines to discover resources funded by the library may lead to a move away from “indexing databases” which provide discovery avenues for patrons without providing full text access to resources. As prices for information increase and library budgets are not increased at the same rate, this is one area where libraries may make spending cuts. However, since search engines tend to be much less robust in search functionality than library discovery systems, those cost savings would mean a loss of discovery capabilities.

Movement toward networked systems

Libraries are a somewhat unusual industry in that they are not in competition with one another, but all benefit from improvements at any individual library. Librarians at different institutions often collaborate to contribute to enhancing information availability and access globally. The largest collaborations involve sharing information on resources. This information is referred to as metadata, or descriptions that contextualize resources, allowing users to search, find, identify, and browse library resources. These metadata are shared and rely on large collections such as OCLC’s WorldCat for descriptions on resources that can be reused by libraries. This fundamental collaborative effort has led not only to networked systems but a host of best practices and national standards to facilitate metadata interoperability and exchange and being able to relationally link seemingly disparate metadata.

Linked data

The change from documents to data in cataloging and metadata units reflects the larger changes with the Internet. This is the dream of the “semantic web” where structure is applied to meaningful content in such a way that computer systems can carry out complex tasks (Berners-Lee et al., 2001). These are metadata that are shared, exchanged, and managed in network environments or linked data. The appeal of linked data for academic libraries is to improve the user experience and take advantage of the rich metadata

Fig. 4 Change in average e-resource usage at ARL libraries.

available on the Internet. However, the reality of linked data and the semantic web are still a dream. The work to ensure that metadata can be shared, exchanged, and managed between a panoply of different systems is daunting. To accomplish this, metadata must be structured in such a way that heterogeneous systems can process that information. This requires a shared understanding of how data are structured and shared that crosses barriers of language, cultures, and proprietary systems. Fundamentally, this work requires that people come together to realize that dream and ensure that metadata can flow between systems. Further, this work depends on the quality of the underlying metadata (Banerjee, 2020) which requires human resources to ensure that minimal quality. The continual trend of decreasing library staff particularly in technical services makes reaching this dream even more difficult. In short, linked data solves technical issues, not human problems (Banerjee, 2020).

Thanks to the transition to linked data and the need to solve human problems, technical services are often reinventing themselves. This is ever more true in light of budgetary challenges, the need to find efficiencies in workflows, the move toward more electronic resources, and shifts in staff. Efforts to reduce costs and increase collaborative efforts can often mean a chance to reinvent technical services and refresh staff toolkits (Cerbo, 2011). Academic libraries need to work to ensure that personnel reductions do not affect the human resources needed to maintain and update library infrastructure (Hill, 2008). The pressure to maintain staff levels coupled with rising costs of resources, predatory publishing practices, and a more complex networked information infrastructure result in technical services units that are often overwhelmed.

Open source

Open source refers most frequently to software code that is openly available. In librarianship, open source goes beyond this definition to include community, collaboration, innovation, shared principles, and often a transparent governance structure (Engard, 2010). Open source in librarianship and in particular technical services includes open source software systems such as those needed to perform core operations including circulation, cataloging, acquisitions, and tools needed to manipulate and manage library metadata. Open source solutions have been used for decades in technical services. A good example, often referred to as the swiss army knife of working with library data, is the software developed by Terry Reese called MarcEdit, originally created in 1999 (Reese, 2018). MarcEdit provides a set of tools for working with large sets of library data and was originally created as a way to automate large cleanup projects at the Oregon State University Libraries. Since that time, it is the preferred solution for working with library data all over the world. Thanks to its creator and maintainer Terry Reese, this tool now goes beyond library data and provides many more features to work with library data in different standards and formats. In the realm of core functional systems sometimes referred to as “integrated library systems” or more commonly now, “library service platforms”, an example is Evergreen, an open source integrated library system developed in 2006 by the Georgia Public Library System (Evergreen.org, 2017). Evergreen is now the library system used by more than 2000 libraries to manage data critical to daily operations such as circulation, acquisitions, or cataloging. These tools and library services platforms are intimately associated with their communities where interested parties strive to improve not just the open source software but also how the community and software is governed, developed, and shared. While there are a number of open source tools for those working in technical services, the availability of open source library service platforms remains very small.

Library services platforms

The move to open source library service platforms started early, as we saw with Evergreen. Koha, another open source integrated library solution, was developed around the same time as Evergreen in 1999 (Koha.org). Though these open source systems have been implemented worldwide, their adoption has been limited. Evergreen and Koha play a small role in the already very limited pool of options for library service platforms (Breeding, 2020). One reason for this is the rise of large companies that have multiple arms that serve both content and software to libraries. These large companies often acquire smaller or less diverse ones to gain a larger share of the market (Breeding, 2020). Further, these large conglomerates provide the core functions needed by libraries with varying degrees of customization allowed, and sometimes even with features that extend into the realm of managing scholarly output or digital resources. Because of this complexity in the core systems used by the library for its central functions, and the content that often comes from that same vendor, these systems are costly, can be hard to maintain, and are often difficult to update. This complexity often translates as high costs to acquiring and maintaining these core systems. This coupled with sometimes predatory publishing practices put many libraries in difficult situations, often having to make decisions on systems and content that can be purchased, leased, or rented. As a response to this and the small playing field of vendor solutions, more open source library service platforms are being considered. While Evergreen and Koha tend to be implemented in public libraries, FOLIO, or the Future of Libraries is Open, is being developed as an open source platform and community for academic institutions (FOLIO.org).

In spite of the above considerations, implementing open source should not be equated with acquiring tools or complex software like library service platforms free of charge (Morgan, 2004). Whether an open source or a vended solution is implemented, there is a cost for the core infrastructure of libraries in carrying out core services and managing the multiple types of resources that libraries manage for their patrons. In the open source community, this translates to being involved in the development and maintenance of the software, training, documentation, and/or governance. It is often said that a community is only as strong as its members.

Diversity and inclusion

In order to improve access to information for readers who are not connected to well-resourced libraries, many research libraries provide an institutional repository where scholars can upload preprints or postprints of their publications. This research is accessible free of charge around the world. Libraries also promote affordable access to educational materials to help students afford the information they need for their coursework. One way libraries provide affordable access to educational materials is by supporting the creation and dissemination of Open Educational Resources.

Advocating for inclusive access to research materials relies on both making materials affordable and making resources discoverable. It is crucial to recognize that inclusive access hinges on library users' being able to find resources in a way that embraces diversity and reflects their search habits. Hence, the role of library technical services in acquiring, managing, and serving up resources and content for library patrons must take into account the ways in which our metadata and systems are biased. Like many institutions, the information used to describe resources and often the tools and software used in technical services need to be improved. The standards and practices used in technical services were created by individuals with biases and blind spots. The recent example of trying to update the Library of Congress authorized subject term, "Illegal alien", to a more inclusive term captures not only the bias inherent in existing systems, but also the challenges faced when moving the community toward more inclusive standards and practices (Aguilera, 2016). Another example of combatting bias is the story of Dorothy Porter, named inaugural curator of the Howard University's Negro Collection or Mooreland Foundation in 1930. She unlearned her library training to develop a classification system inclusive to Howard's black students and black audiences in general (Helton, 2019). To avoid biases, errors, or oversights, the process of developing and maintaining library infrastructure should not be invisible or go unnoticed (Helton, 2019). In recent years, a surge of scholarship and practices has emerged around critically evaluating how information is used to describe and make resources available through library systems.

Over 3.6 billion people use social media globally. This is projected to increase to about 4.41 billion by 2025. China has the highest numbers of social media users across the globe with 999.95 million users. The remaining top five countries with the highest numbers of social media users in 2021 include (in millions): India (639.47 users), United States (295.48 users), Indonesia (193.43 users) and Brazil (159.01 users) (Statista, 2021).

Universities have embraced the use of social media around the world. Higher education has incorporated social media and its' use as an online platform that supports formal and informal communication. Education has embraced the use of social media globally (Chugh and Ruhi, 2017). Social media in higher education is used in several ways (1) university communication with current students and prospective students; (2) as a support or main "platform" for teaching and learning; (3) as a way of sharing information from university academic based centers We focus on the use of social media in teaching and learning and the associated benefits and challenges.

Institutions of Higher Education (IHE) communicate regular information with students and faculty via their official university Facebook, Twitter, Instagram or TikTok, etc., accounts. Different campus offices often have their own social media accounts, e.g., student affairs, President's Office and academic programs, Library, Sports, Health, etc. These offices provide a variety of information such as keeping students apprised of emergency information, campus closures, announcements, events, etc.

When the Covid-19 Pandemic hit different countries, the need for social media became more prevalent. For example, when Covid-19 arrived in the United States, emergency information was sent via telephone messages, text-messages, Email, LMS messages and via social-media that various campuses would move to 100 % remote instruction. The United States serves many international students. Chinese students represent 33.7 % of the international student population in the US. They are followed by Indian students at 18.4% of the international students in the US. The COVID-19 pandemic left many international students unable to return to their US campus (Times Higher Education, 2020). Across the globe, many countries began to rely on social media use. According to the United Nations:

UNESCO estimates that over 1.5 billion students in 165 countries are out of school due to the COVID-19 pandemic. The pandemic has forced the global academic community to explore new ways of teaching and learning including distance and online education. This has proven challenging for both students and educators who must deal with the emotional, physical and economic difficulties posed by the illness while doing their part to help curb the spread of the virus. The future is uncertain for everyone, particularly for millions of students scheduled to graduate this year who will face a world crippled economically by the pandemic.

(United Nations, Accessed November 22, 2021).

With the onset of COVID-19, many universities around the world were forced to close their doors to students, faculty and staff and immediately transferred to remote learning or work:

...education officials have been forced to cancel classes and close the doors

To campuses around the world in response to the growing Coronavirus

Outbreak.

(Times Higher Education, 2020).

It is safe to say that over the course of the COVID-19 Pandemic, universities across the globe saw an increase in social media use. By asynchronous, we refer to 100% online instruction on an LMS or social media faculty created LMS. This means that all instruction occurs online and there is no face-to-face meeting with the instructor via Zoom or some other video platform. Synchronous instruction during COVID-19 includes the use of LMS and social media and/or social media as an LMS created by faculty. This includes meeting face-to-face via Zoom or Teams or some other type of video meeting. Indeed, different higher education institutions across the world moved from face-to-face to online, remote, synchronous, and asynchronous education because of the COVID-19 Pandemic. Some educational institutions were able to move into online instruction with some ease, in that, they had established LMS structures in-place. In some developing countries, this was not the case. These universities did not have access to LMS and turned to the use of platforms such as Google Classroom and Zoom (Sobaih et al., 2020).

In the case of developing countries, there was a move to incorporate free social media sites into the remote teaching and learning environments. In some countries, faculty were challenged to identify social media sites to due to the lack of LMS. Sobaih et al. (2020) note:

However, public universities in many underdeveloped nations, e.g., Egypt, are

Suffering from a lack of technological platforms and formal online learning

Management systems (LMS) for communication with students or with their

Faculty members. Hence, they do not have the full capabilities to support the

Online learning process (page 1).

It should be noted that to commemorate Spanish Language Day and to consider the impact of.

COVID-19 on IHE's, the United Nations Academic Input (UNAI) "hosted a Spanish language webinar on April 23." Over seventy universities from Latin America were represented. Other universities in attendance were from Latin America. Other universities in attendance were from Japan, France, and Spain. (UNESCO, Report, United Nations, n.d.). The participants of the Spanish Language Day Webinar came together to discuss the impact of the pandemic in higher education, and as Christine Gallach, Secretary of State for Foreign Affairs (Spain) noted: "We have to take this opportunity to deepen this concept of shared mankind as we share not only a pandemic but a planet and ourselves" (Page 2, UNESCO, Report, United Nations, n.d.).

Gallach called for "academic cooperation and multilateral assistance to overcome the difficulties posed by the pandemic and contribute to the common good" (Page 2).

During the UNAI webinar, universities were called upon to collaborate and share new ways of sharing knowledge. Milenko Skoknic (Permanent Representative of Chile to the United Nations) stated that:

...solidarity was embedded in higher education and universities could facilitate the sharing of knowledge thru open courses, joint research, and new creative teaching methods and educational alternatives (Page 2).

In the next section we consider the different ways universities around the world began to deliver 100% online instruction thru a combination of LMS and social media and social media (only) as a type of informal, instructor designed "LMS."

Learning management systems and social media in teaching and learning

Faculty use social media to enhance instruction, or as an easy way to communicate with students (e.g., post announcements, assignments). Social media is often used as a support to a Learning Management System (LMS) used at a given university. Faculty use a combination of social media apps to support an LMS like Canvas, Blackboard or Moodle. Other LMS platforms include Google Classroom, which represents 39% of the LMS market. Other LMS used world-wide include: Mindflash, Skyprep, Proprofs, iSpring Learn, Talentme, Cocebo and Litmos (Software Testing Help, 2021). As of April 2020, 43% of educational institutions invested in new online learning resources (Workplace Learning Report, LinkedIn, 2021). In some cases, social media may be used as a faculty-designed LMS, especially given the last 18 months of the Covid-19 Pandemic which saw most (if not all) instruction move to an

on-line experience (asynchronous and synchronous). Notably, the software market that “loomed after COVID-19, LMS might be the biggest.” (Trustradius, 2021) (<https://www.trustradius.com/vendor-blog/lms-statistics-trends>). By the start of the Covid-19 Pandemic, higher education institutions moved online. This created a critical need for LMS software. As a result of the pandemic: “The LMS market exploded in 2020 and will continue growing well past 2021.” (www.trustradius.com). Indeed, as many universities have welcomed some students back to the campus, many faculties and students continue to meet asynchronously or synchronously with the support of social media.

Social media incorporated into LMS

Faculty incorporate social media to support teaching and learning outside of a formal Learning Management Platform using social media like a Facebook (closed) Group (where the instructor can set the class up as a group that is closed to the public and consists only of members of the class. The course instructor gives permission for the students to join the group.) that may focus on course content or be used by the instructor and students to communicate (Vega-Castaneda and Castaneda, 2019). Some LMS like Canvas, Blackboard or Moodle incorporate social media. For example, Canvas incorporates Twitter and YouTube. Most LMS’ allow the instructor to add a URL link for social media use, e.g., Twitter, YouTube, Facebook. Social media is also incorporated into course assignments and for sharing content. Facebook and YouTube allow the instructor to post lectures, information, discussions, upload files, etc. Students may use the same apps to respond to discussions or make presentations. Often, social media is incorporated into assignments. For example, in a history social studies course that I (Lillian) teach, students are required to create a Pinterest page that focuses on some aspect of the (content) of the course. In a course on first and second language acquisition, students present their projects on YouTube or Facebook video or Voice-Thread. Additionally, Facebook is used as a teaching tool and information tool. As part of the first and second language acquisition/bilingual course that I teach, students post bi-weekly language and culture related news stories. We discuss the social, political, and cultural aspects of language acquisition on social media. We also discuss the treatment on social media of individuals who are Emergent Bilingual/English Learners and immigrants and the challenges they face coming to a foreign country and learning a new language and culture. This makes it very easy and accessible for students and instructor alike.

Institutions of Higher Education (IHE) have seen an increased use of social media to support LMS or to serve as the main LMS. For example, some faculty have set up Google Classroom which is free. It allows the instructor to upload assignments, tests, and other course content. It also allows the instructor to upload video’s, PDFs, Google Docs, and various URL links. During the pandemic, instructors created their personalized and free self-designed learning management systems when their university did not have a formal LMS. These instructors created their personal “LMS” using social media apps, e.g., Google Classroom, YouTube, Facebook, Instagram, Twitter, etc. All of these are free social media apps and have aided in the creation of content and tools for communication between the instructor and student, and perhaps most importantly, promoted student to student interaction.

Facebook has been one of the main social media sites used as an educational tool. The benefits include all the aspects of sharing information and creating instances for posting readings and discussion that have been previously mentioned. One way to contrast the use of social media with a traditional LMS is how discussions occur. In comparison, a discussion on social media creates a less traditional way of communicating, in that, posts can be created, responded to information (including links to other sites) can be readily and instantly shared for everyone in the class to see. Facebook has multiple benefits that relate to increased interaction between instructor and student, and student and student. It promotes the exchange of academic content and has seen increased engagement and a “convenience of learning” in an informal (yet academic) context. Facebook has been found to enable connectivity, communication, and collaboration (Chugh and Ruhi, 2017). Indeed, the uses of social media are many:

Social media can be utilized to deliver teaching material, educational information,

Updates and facilitate communication and collaboration. Facebook’s social

Communication aspects benefit both educators and students by creating an online

Class group and increasing interactions between teacher-student and student-student

(Muñoz and Towner, 2011) and promoting collaborative learning (Menzie et al., 2015).

Chugh and Ruhi (2017).

Of note, due to the COVID-19 pandemic, there was an increase in students who began to use social media and created study groups and worked on assignments together. Al-Rahmi et al., 2020, studied students in Pakistan and focused on their use of social media for student interaction during the COVID-19 epidemic. This occurred due to the closure of university campuses, libraries, including the closure of non-university meeting places like coffee-shops or other meeting places. Students were forced to move on-line not only for courses, but for peer interaction. Students met on Facebook, Zoom, and like social media networks. Students used Google Docs to collaborate on academic work that called for collaboration.

Students in some developing countries view some social media as more interactive and user friendly than other free online platforms. Sobaih et al. carried-out research in Egypt and the study consisted of nine public colleges that grant bachelor's degrees in Tourism and Hotel.

Students have more patterns and practices in social media than their faculty member who just focuses on formal teaching and learning. Students used social media for connecting with their faculty member, support each other and building an online community.

Sobaih et al. (2020, p. 14).

When social media and universities collide

Most universities house a variety of centers that focus on some aspect of the academy. In the United States there are centers that address issues of hate and extremism. Other centers focus on specific areas of content that address content in teaching K-12 students. Here are some examples of academic centers that communicate and provide information (on their centers) via social media. For example, California State University, San Bernardino houses the Center for Hate and Extremism <https://www.csusb.edu/hate-and-extremism-center>. Professor Brian Levin is the director of the center. The Center for the Study of Hate and Extremism looks at the following: Anti-Semitic hate, Anti-Asian hate, Anti-Asian Prejudice, World-wide Threats to the Homeland (Professor Brian Levin testifies to the US House of Representative Committee on Homeland Security (September 17, 2020 & September 19, 2019).

The Center for the Study of Hate and Extremism has a Twitter and Facebook account. @proflevin is the Twitter account of Professor Brian Levin; the Facebook page is called "Center for the Study of Hate & Extremism." The Center has also produced different video's including a video on the Radicalization of CA Police Training Video; Black Lives Matter Video – BLM/Justice for Wyandotte (KS); First AME Church; Professor Levin has appeared on MSNBC, CNN, Bill Mahr, American Jewish Committee, and his reach is at the national level. This is just one example of a university-based center that addresses issues covered in the mainstream and social media.

Just as there are many advantages of using social media for communication and teaching and learning, social media in higher education can be mis-used in ways that may impact the university or student, faculty, or staff. Social media can be mis-used by having users post negative or harmful information that may be posted in response to the original information that was shared. On Twitter, for example, at the non-institutional level, something could be posted by a private Twitter user and another Twitter user could post a negative or harmful or threatening response. In this instance, the user may block that individual from their Twitter feed. Potentially, if a university post on Twitter or Facebook or Instagram account receives a negative response, there is the potential for the University to be accused of not respecting the students first amendment right to free speech—if the response is removed, or if the individual is blocked. Additionally, if a threatening post is made on a course social media page, the instructor must follow university policy and, in most cases report the incident to the University Police or Student Affairs office (or equivalent).

There are some recent events/instances where social media has been used to attack individuals in higher education; Here are some examples from the United States, in the post-Trump era. Recently, the author of the 1619 Project, Nikole Hannah-Jones was denied tenure at the University of North Carolina Chapel Hill (Robertson, 2021). Members of the Trustees overturned the recommendation for tenure made by the faculty. It is believed that the major reason the Trustees denied Hannah-Jones' tenure is the content she writes about in the 1619 Project, which covers the history of slavery in the United States. The 1619 Project has been used as a rallying cry for those who do not want to see the history of slavery and treatment of blacks told from a non-White perspective. It is believed that Hannah-Jones' tenure negative tenure decision occurred because the Trustee's did not "agree" with her 1619 writings. The 1619 Project and Hannah-Jones' tenure denial and ultimate offer of Full Professor and tenure at Howard University were covered across many different social media platforms. Some social media posts supported Hannah-Jones', but others saw individuals posting racist tropes. Hannah-Jones used the negative portrayal of the 1619 Project and turned it into a positive by announcing her acceptance of Full Professor with Tenure at Howard. The announcement was posted on major social media sites. In part, she states:

I will be taking a position as the inaugural Knight Chair in Race and Reporting at

Howard University, founded in 1867 to serve the formerly enslaved and their descendants

There, I will be creating a new initiative aimed at training aspiring journalists to cover the

Crisis of our democracy and bolstering journalism programs at historically Black

Colleges and universities across the country. I have already helped secure \$15 million for

effort, called the Center for Journalism and Democracy....

Hannah-Jones (2021).

The main author of the 1619 project now a Professor at Howard University (a Historically Black Research University), and the history of slavery will be covered across some universities and schools un the US. Some K – 12 school districts have incorporated the 1619 project into their curriculum. According to Education Next (Riley et al., 2020): “School districts in Chicago; Newark, N.J; Buffalo, N.Y., and Washington, DC all announced 1619 Project related events.”

The debate continues to occur via social media and shared by news media on social media, e.g., MSNBC, CNN, PBS, Fox, NBC, ABC, national and local news on their social media sites. One only must read the comments from the public to get an idea of the divide between teaching about the history of racism and slavery in the United States and those who argue that it doesn’t need to be taught, as if it never happened. For specific information on the 1619 Project please follow this link:

https://pulitzercenter.org/sites/default/files/full_issue_of_the_1619_project.pdf.

Universities and K-12 schools have recently been a subject of debate on various social media sites. The topic of debate – Critical Race Theory CRT) has been a topic of discussion on social media and has overlapped into whether it should be taught in K-12 schools (it isn’t). Universities have held different discussions on CRT with scholars as a way of countering the misinformation surrounding CRT. Critical Race Theory is taught in higher education, usually in law school. It can also be taught in master’s and Doctoral programs that address issues of race and racism. CRT is a way of looking at racial relations, particularly within the United States. It is looked at from the historical background of race and racism. CRT began in the mid-seventies, as several people in the legal profession began to worry about the slow rate at which laws were changing to promote racial equality, and that many of the early victories of the Civil Rights Movement were being eroded. One of the key elements of CRT is a way of looking critically at race relations in the United States, examining everyday interactions, and finding the racial component in them, that moves beyond the “color blind” approach to race relations. Although critical race theory began with the legal profession and legal professor Derrick Bell (easily the most important thinker within the movement) it has since spread to many other disciplines.

Educators may find CRT very important to their understanding of classroom dynamics, testing, tracking students, including curriculum bias. Individuals involved in the political sphere may find critical race theory useful in understanding voting discrepancies, race-based campaigning, and other issues. To be sure, it is not a surprise that higher education in the US has been at the forefront of the debate. Perhaps one of the most decisive arguments of CRT as shown on social media, is the questioning of the normative acceptance of what it is to be white. According to “Words that Wound: Critical Race Theory, Assaultive Speech, and the First Amendment (Matsuda et al., 1993, 2019):

Critical race theory recognizes that racism is endemic to American life.

Thus, the question for us is not so much whether or how racial discrimination

Can be eliminated while maintaining the integrity of other interests implicated

In the status quo such as federalism, privacy, traditional values, or established

Property interests. Instead, we ask how these traditional interests and values serve

As vessels of racial subordination.

Since CRT is taught in universities across the United States, the recent social media debate has re-emerged as a leading talking point within the political arena. CRT is most likely being questioned as it expresses skepticism toward dominant legal claims of neutrality, objectivity, color blindness and meritocracy. Because CRT's origins are in law, it insists on the recognition of experiential knowledge of people of color and our communities of origin, while analyzing law and society. To be clear, CRT is not taught in K-12 educational settings, yet the rhetoric on social media arguing against the teaching of CRT is present on social media and this connects back to higher education. To be clear, CRT is not taught in K-12 US schools, and it originated in the preparation of lawyers.

Challenges of higher education and social media

There are challenges associated with using social media as a teaching resource.

One of the main drawbacks is the lack of real time, face to face communication between the instructor and student and student to student. In an asynchronous setting, with an LMS and social media, or an instructor developed LMS consisting of social media apps, the lack of interaction can be described as removed. Although interaction on social media sites, such as Facebook can encourage interaction, written and in some cases, by video, the lack of a given meeting time on a platform like Zoom can create a distanced and removed communication approach. Conversely.

"Social media reduces boundaries between university faculty, students and audiences with access to social media platforms." (Ngai et al., 2015). While it is true that boundaries can be reduced, it is also true that the social distance between the instructor and students can also become removed. This clearly presents a challenge, and it is the instructor's role to ensure that communication and interaction on social media does not become static, and that communication and interaction occurs from professor to student, student to student and student to professor.

Privacy issues

Does the university have rules or guidelines for social media use? In some global universities, there is a challenge about using social media. Not all universities around the world support the use of social media (Waller et al., 2019).

If the instructor creates a closed group, for example a closed Facebook group or a closed Instagram group, some degree of privacy (between the group members) can be assumed. However, in the case of Facebook, each member's FB profile page can be viewed by everyone in the class.

With social media access to forums such as Facebook, both professors and students can see information, professional pictures, and communications about one another bringing about issues with professionalism.

Shelton (2016).

Some faculty members have identified challenges of using social media. Some of the barriers involve concerns with the digital divide, a sense of security, and loss of control. Some faculty do not think social media is appropriate for academic use (Sobiah et al., 2020, p. 3; Sobiah et al., 2016; Manca and Ranieri, 2016).

Waller et al. (2019) also identify educational concerns. How does the instructor which content to include on social media? What is considered acceptable and relevant to the subject matter of the course? How do students know what to share? What is considered acceptable and relevant? Many universities have policies that specify social media "behavior" when representing a university. Some universities require instructors to present a "plan" of how they will use or integrate social media into their courses. Instructors also include "social media etiquette" guidelines in their course syllabi.

Some faculty are hesitant to use social media (or LMS)—this can lead to a lack of organization of a remote classroom experience; Instructors need to be well-versed in technology, using social media and LMS (Waller et al., 2019).

Access issues

Student and faculty access issues to an LMS & social media on a computer, tablet, smartphone etc., also present a challenge. Do they have access to a smartphone or a computer? Does the student or faculty member have access to the internet? Does the university have the technological infrastructure to support remote teaching and learning? Do students and/or faculty know how to use social media and/or LMS and social media? Do students feel free to initiate posts? As noted earlier, during the Spanish Language Day Webinar hosted by the U.N. Academic Input (UNAI), participants discussed the lack of internet access for many students and professors. Francesco Pedró, director of the UNESCO International Institute of Higher Education in Latin America and the Caribbean noted:

While institutions of higher education have to continue their teaching responsibilities, at least a third of students and an equal percentage of professors do not have access to the internet, hampering the success of a temporary transition to virtual education.

United Nations (n.d.).

Issues of social media use in higher education and potential disruption of teaching and learning are not necessarily new to higher education (Digital Disruptions: Handling Social Media Misuse.

By Students and Educators. Fisher-Philips, n.d.): "However, use of social media by students and educators outside the classroom can have profoundly negative impact on the learning environment." Reference is made to Harvard University who, in 2017 learned that "dozens of members of the Class of 2021 participated in a private messaging group that included messages and images insulting people based on their national origin, contained sexually explicit material, and mocked the Holocaust, among other things (Page 2)."

Harvard University ended up rescinding the admission offers to these individuals (at least 10). This incident is considered one of the first where a private university reacted to what was posted by potential students on social media.

Public universities must ensure that "any student discipline does not run afoul of First Amendment free speech rights. Under longstanding constitutional law, a student receives protection if the offending speech addresses a matter of public concern and is not sufficiently disruptive to the learning atmosphere in the school" (Fisher-Phillips, n.d., p. 3).

There are also requirements for how faculty conduct their selves on social media. Social media policy should focus on how faculty and students are to engage and represent the university:

Instead of focusing on the delivery method, your social media policy should focus on the nature and effect of the expression by prohibiting specific conduct that would likely violate your ethics, harassment, or other applicable policies.

Fisher-Philips (n.d., p. 3).

Because social media is considered (somewhat) a new frontier in higher education and teaching and learning, the use of social media and policies that guide it, are still at the emerging stage. Yet, there are some court cases that we can look to, including *Pickering v. Board of Education* (1968) which involved a teacher who was fired for writing a letter to the editor in which the criticism, aimed at the superintendent and school board, focused on the high expenditures for sports as opposed to academics. The termination of the teacher was found unlawful and the "Supreme Court stated that government employers must arrive at a balance between the interests of the teacher, as a citizen, in commenting upon matters of public concern and the interests of the State, as an employer, in promoting the efficiency of the public services it performs through its employees" (Fisher-Philips, n.d., p. 7).

Closing thoughts

The use of social media in higher education is a new occurrence. Some instructors have used social media in their coursework prior to the Pandemic – in my (Lillian's) case, for ten years or more, where I have linked a Closed Group Facebook page and used it in conjunction with on-campus teaching and learning and an LMS. Social media like Facebook is easily integrated into coursework and is often attached to an LMS and a combination of face-to-face teaching and learning. The arrival of the COVID-19 pandemic threw many universities across the globe into an immediate movement of all face-to-face instruction to online, virtual instruction. The move to virtual instruction, due to the pandemic also included an increased use of traditional LMS like Canvas, Moodle, Blackboard, Google Classroom, etc., and in many cases, included the use of social media, e.g., Facebook, Twitter, Instagram, Pinterest, YouTube, and others. Some faculty incorporated social media into their LMS as a way of encouraging easier communication and information sharing, content, and exchange of ideas. Other universities, including those who did not have a traditional LMS relied on using social media as the "LMS" for delivering instruction, including teaching and learning. We refer to the 100% faculty created LMS as "faculty designed."

With the arrival of the COVID-19 Pandemic, universities across the globe moved almost instantly from on-campus, face-to-face instruction to all classes moving to an online/virtual environment. The impact of the Pandemic will not be known for some time, as the world is still in the midst-of the COVID-19 Pandemic, even though several vaccines have been adopted and used across the world. During the summer of 2021, the Delta variant arrived, and this led to the uptick in COVID-19 positivity rates and fatalities.

The delta variant, which was first detected in India last October, has been found in more than 130 countries globally, according to the World Health Organization.

Lee (2021).

Currently, in the Fall of 2021, the world is seeing the emergence of another new variant in "Southern Africa, Botswana, Belgium, Hong Kong and Israel."

The World Health Organization gave the new version of the virus the name Omicron and called it a "variant of concern, its most serious category." This variant has many mutations, some of which are concerning, the W.H.O. said in its official description. "Preliminary evidence suggests an increased risk of reinfection with this variant."

(Horowitz et al., November 26, 2021, NY Times).

Universities continue to use social media as a component of a formal LMS or as a faculty designed LMS consisting of social media apps. Some universities around the world have re-opened on-campus instruction with protocols in place to screen for COVID-19. Faculty and students continue to explore the role of social media in higher education with a variety of results. Depending on the faculty and student experience in using social media, the results of its use will be varied.

Clearly, there are challenges to incorporating social media into university teaching and learning, but we believe the benefits outweigh the drawbacks. The move to online instruction because of the pandemic has opened a different way of communicating and using knowledge across the globe and this will be a subject of continued study.

Across the globe, democratic institutions such as the independent media, schools, the legal system, certain financial institutions, and higher education are under siege. Such repressive forces are at work in Turkey, Hungary, Brazil, and a number of other countries. The promise, if not ideals, of democracy are receding as the barbarians who breathe new life into a fascist past are once again on the move subverting language, values, courage, vision and a critical consciousness. Education has increasingly become a tool of domination as right-wing pedagogical apparatuses controlled by the entrepreneurs of hate attack workers, the poor, people of color, refugees, immigrants from the south and others considered disposable. In the midst of an era when an older social order is crumbling and a new one is struggling to define itself, there emerges a time of confusion, danger, and moments of great restlessness.

In Turkey, dissident intellectuals including academics and journalists have been either imprisoned or expelled (Hansen, 2019). In Brazil, the reactionary President Jair Bolsonaro has launched a full-fledged campaign against the work of Paulo Freire (Woods, 2020). In Hungary, President Orbán shut down the liberal Central European University (Walker, 2018). President Xi Jinping has crushed dissent in Hong Kong silenced many in China's vibrant intellectual circles. What has become clear is that the present moment is once again at a historical juncture in which the structures of liberation and authoritarianism are vying for shaping a future that appears to be either an unthinkable nightmare or a realizable dream.

We have arrived at a moment in which two worlds are colliding and a history of the present is poised at a point when "possibilities are either realized or rejected but never disappear completely" (Thompson, 2013). First, there are the harsh and crumbling worlds of neoliberal globalization and its mobilizing passions that fuel different strands of fascism across the globe, touching countries on almost all continents (Hall, 2012; Harvey, 2005; Wolin, 2008; Brown, 2015; Eubanks, 2017; Monbiot, 2017; Giroux, 2018). Power is now enamored of amassing profits and capital and is increasingly addicted to a politics of white nationalism and racial cleansing. Second, there are growing counter movements, especially among young people, with their search for a new politics that can rethink, reclaim and reinvent a new understanding of democratic socialism, untainted by capitalism (Derber, 2017). Within the last few years massive protests have taken place among young people in the United States, Chile, Peru, and South Africa. In many countries such as South Africa, Tunisia, and the United States these protests have been met with massive violence. What is not in doubt is that something sinister and horrifying is happening to liberal democracies all over the globe. The global thrust toward democratization that emerged after World War II is giving way once again to authoritarian tyrannies. As alarming as the signs may be, the public cannot look away and allow the terrors of the unforeseen to be given free rein. For those who believe in democratic socialism we cannot allow the power of dreams and militant hopes to turn into ashes.

We now live in a world that resembles a dystopian novel. The COVID-19 crisis created a surrealist nightmare that floods our screens and media with images of fear. People can no longer shake hands, embrace our friends, use public transportation, sit in a coffee shop, or walk down the street without experiencing anxiety and fear. While vaccines have been developed to assuage such fears, the unequal distribution of such vaccines between the developed and undeveloped nations suggests that it will be some time before the virus is brought under control. Under such circumstances, what must be acknowledged is that the pandemic is more than a medical concept. It also refers to ideological and political plagues that emerged as a result of the irresponsible response of the US and other countries such as Brazil, the United Kingdom, and India to the Covid-19 crisis. Surprisingly, in spite of Africa not having adequate supplies of the vaccine and resources to fight the disease, a catastrophic outbreak has not yet materialized as badly as expected. Marked by inept leadership rooted in a distrust of science and reason and a blind allegiance to market forces, what emerged over time was unimaginable suffering, massive deaths, and a further legitimization of lies and right-wing violence. The horror of the pandemic often blinds us to the fact that anti-democratic economic and political forces that have prioritized profits over human needs have grinded away at the social order for the last 40 years.

A form of predatory capitalism has waged war on the welfare state, public sphere and the common good since the 1970s. As a form of predatory capitalism, neoliberalism believes that the market should govern the economy and all aspects of society. It concentrates wealth in the hands of a financial elite and elevates untrammelled self-interest, self-help, deregulation, and privatization as the governing principles of society. Under neoliberalism, everything is for sale and the only obligation of citizenship is consumerism. At the same time, it ignores basic human needs such as healthcare, food, decent wages, and quality education. Neoliberalism views government as the enemy of the market, limits society to the realm of the family and individuals, embraces a fixed hedonism, and challenges the very idea of the public good.

We live in an age when economic activity is divorced from social costs, while policies that produce racial cleansing, militarism, and staggering inequality have become defining features of everyday life and established modes of governance especially in the United States. Clearly, there is a need to reclaim a notion of democratic socialism in which matters of justice, equity, and equality become the central features of a substantive democracy. The good news is that the demonstrations taking place across the globe suggest that the spirit of democratic socialism is in the air. Yet, the Russian invasion of the Ukraine has undermined such hopes.

The pandemic revealed in all its ugliness, the death producing mechanisms of systemic inequality, deregulation, a culture of cruelty, and an increasingly dangerous assault on the environment. It has also made visible an anti-intellectual culture that derides any notion of critical education, that is an education that equips individuals to think critically, engage in thoughtful dialog, appropriate the lessons of history, and learn how to govern rather than be governed. At the same time, the claims of neoliberal capitalism have been undermined as a result of the economic failures and medical horrors let loose by the pandemic. What was once unthinkable is now said in public by demonstrators across the globe are protesting police violence, climate devastation, and the brutality of economic inequality. Young people are reaching out across borders to address their counterparts in Nigeria, Sweden, the United States, Brazil, and other countries. They are calling for a new narrative to repair the safety net, provide free healthcare, childcare, elder care and free quality public schools for everyone. There are loud calls to address state violence, and the plagues of poverty, homelessness, and the pollution of the planet.

The pandemic is a crisis that cannot be allowed to turn into a catastrophe in which all hope is lost. While this pandemic threatens democracy's ability to breathe, it offers the possibility to rethink politics and the habits of critical education, human agency, and elements of social responsibility crucial to any viable notion of what life would be like in a democratic socialist society. Matters of inequality, globalization, and climate change are objects of massive protests in counties that include but are not limited to Africa, the UK, Brazil, Uganda, Pakistan, and Ecuador. At the current moment, Russian brutality in Ukraine is the subject of mass protests across the globe.

Put differently, amid the corpses produced by neoliberal capitalism and COVID-19, there are flashes of hope, a chance to move beyond contemporary resurgences of authoritarianism. Paulo Freire understood that such a politics is rooted in a pedagogy of hope, one that integrated a critical reading of the world with an attempt to put into practice modes of struggle based on the principles of social and economic equality and human freedom.

It is hard to imagine a more urgent moment for taking seriously Paulo Freire's ongoing attempts to make education central to politics. At stake for Freire was the notion that education was a social concept, one rooted the goal of emancipation for all people. Moreover, this is an education that encourages human agency, one that is not content to enable people to only be critical thinkers, but also engaged individuals and social agents. This is a pedagogy that calls us beyond ourselves, and engages the ethical imperative to care for others, dismantle structures of domination, and to become subjects rather than objects of history, politics, and power. If we are going to develop a politics capable of awakening our critical, imaginative, and historical sensibilities, it is crucial for educators and others to remember Freire's ongoing project of literacy. Freire's work builds upon the work of many other theorists that include but are not limited to Antonio Gramsci, Raymond Williams, Nelson Mandela, and Frantz Fanon. Moreover, the influence of Freire's work was not only obvious in the United States, UK, and Brazil but also South Africa, especially given its influence in the Black Consciousness Movement often aligned with Steve Biko. This was particularly obvious given his early work in several former Portuguese colonies such as Guinea-Bissau and Mozambique. In the 1970s and 80s, Freire work was often associated with the United Democratic Front in South Africa. At the present moment, Freire's work is taken up in a number of ongoing projects that extend from Geneva, Switzerland and Berlin to Portugal and the University of KwaZulu-Natal, South Africa.

What many of these theorists shared was a political project in which civic literacy infused with a language of critique and possibility addressed the notion that there is no democracy without knowledgeable and civically literate citizens. Such a language is necessary to enable the conditions to forge a collective international resistance among educators, youth, artists, and other cultural workers in defense of public goods. This was especially true with regards to the role of literacy and consciousness raising in shaping trade unions and grassroot struggles. Such a movement is important to resist and overcome the tyrannical fascist nightmares and white supremacists movements that have descended upon the United States, Brazil, India, South Africa, and a number of other countries. In an age of social isolation, information overflow, a culture of immediacy, consumer glut, and spectacularized violence, it is all the more crucial to take seriously the notion that a democracy cannot exist or be defended without civically literate and critically engaged citizens and the institutions that make it possible.

Education both in its symbolic and institutional forms has a central role to play in fighting the resurgence of fascist cultures, mythic historical narratives, and the emerging ideologies of white supremacy and white nationalism. Moreover, as fascists across the globe are disseminating toxic racist and ultra-nationalist images of the past, it is essential to reclaim education as a form of historical consciousness and moral witnessing. This is especially true at a time when historical and social amnesia have become a national pastime, particularly in the United States, matched only by the masculinization of the public sphere and the increasing normalization of a fascist politics that thrives on ignorance, fear, the suppression of dissent, and hate. Education as a form of cultural work extends far beyond the classroom and its pedagogical influence, though often imperceptible, is crucial to challenging and resisting the rise of fascist pedagogical formations and their rehabilitation of fascist principles and ideas (Mayer, 2019).

The pedagogical lesson here is that fascism begins with hateful words, the demonization of others considered disposable, and moves to an attack on ideas, the burning of books, the disappearance of intellectuals, and the emergence of the carceral state and the horrors of detention jails and camps. As a form of cultural politics, critical pedagogy provides the promise of a protected space within which to think against the grain of received opinion, a space to question and challenge, to imagine the world from different standpoints and perspectives, to reflect upon ourselves in relation to others and, in so doing to understand what it means to "assume a sense of political and social responsibility" (Nixon, 2015).

Cultural politics in the last twenty years has turned toxic as ruling elites across the globe increasingly gain control of commanding cultural apparatuses turning them into pedagogical disimagination machines that serve the forces of ethical tranquilization by producing and legitimating endless degrading and humiliating images of refugees, immigrants, Muslims, and others considered excess, or wasted lives doomed to terminal exclusion. The capitalist dream machine is back with huge profits for the ultra-rich, hedge fund managers, and major players in the financial service industries. In these new landscapes of wealth, fraud, and social atomization, a savage and fanatical capitalism promotes a winner-take-all ethos, normalizes massive inequalities in wealth and power, and aggressively undermines the welfare state while pushing millions into hardship and misery. The geographies of moral and political decadence have become the organizing standard of the dream worlds of consumption, privatization, surveillance, and deregulation. Within this increasingly fascist landscape, public spheres are replaced by zones of social abandonment and thrive on the energies of the walking dead and avatars of cruelty and misery.

The assault on education has been particularly evident in the West and the emphasis we give the West in this paper is not one that clings to a notion of ethnocentrism or indulges a colonial legacy. The emphasis here is on a West is crucial because it operates within a powerful colonial framework that still imposes its ideologies, educational visions, and notions of politics on the rest of the world. Education within the last three decades has diminished rapidly in its capacities to educate young people and others to be reflective, critical, and socially engaged agents. Under neoliberal regimes, the utopian possibilities formerly associated with public and higher education as a public good capable of promoting social equality and supporting democracy have become too dangerous for the apostles of authoritarianism. Increasingly public schools are subject to the toxic forces of privatization and mindless standardized curricula while teachers are deskilled and subject to intolerable labor conditions. Higher education now mimics a business culture run by a managerial army of bureaucrats, enamored of market values, who resemble the high priests of a deadening instrumental rationality. The commanding visions of democracy are in exile at all levels of education. In many states books are being banned, critical race theory is under attack, and a war is being waged on LGBTQ youth.

Critical thought and the imaginings of a better world present a direct threat to neoliberal rationality in which the future must always replicate the present in an endless circle in which capital and the identities that it legitimates merge with each other into what might be called a dead zone of the imagination and pedagogies of repression. This dystopian impulse thrives on producing myriad forms of inequality and violence—encompassing both the symbolic and the structural—as part of a broader attempt to define education in purely instrumental, privatized, and anti-intellectual terms. What is clear is that neoliberal modes of education attempt to mold students in the market driven mantras of self-interest, harsh competition, unchecked individualism, and the ethos of consumerism. Young people are now told to invest in their careers, pack their resumes, and achieve success at any cost. It is precisely this replacement of educated hope with an aggressive dystopian neoliberal project and cultural politics that now characterizes the current assault on public and higher education in various parts of the globe. Under neoliberalism, the mantra of privatization, deregulation, the whitewashing of history, and the destruction of the public good is matched by a toxic merging of inequality, greed, and the nativist language of borders, walls, and camps.

It is crucial for educators to remember that language is not simply an instrument of fear, violence, and intimidation, it is also a vehicle for critique, civic courage, resistance, and engaged and informed agency. We live at a time when the language of democracy has been pillaged, stripped of its promises and hopes. For instance, authoritarians such as Jair Bolsonaro in Brazil, Viktor Orbán in Hungary, President Abdel Fattah al-Sisi in Egypt, and President Abdelmadjid Tebboune in Algeria, the degradation of language reinforces Umberto Eco's remark that education is an organizing principle of fascism. According to Eco, one of the central features of what he called "Ur-Fascism" was its undermining of civic literacy "through Fascist schoolbooks [that] made use of an impoverished vocabulary, and an elementary syntax, in order to limit the instruments for complex and critical reasoning" (Eco, 1995).

If fascism is to be defeated, there is a need to make education an organizing principle of politics and, in part, this can be done with a language that exposes and unravels falsehoods, systems of oppression, and corrupt relations of power while making clear that an alternative future is possible. Hannah Arendt was right in arguing that language is crucial in highlighting the often hidden "crystallized elements" that make fascism likely (Arendt, 2001). Language is a powerful tool in the search for truth and the condemnation of falsehoods and injustices. Moreover, it is through language that the history of fascism can be remembered and the lessons of the conditions that created the plague of genocide can provide the recognition that fascism does not reside solely in the past and that its traces are always dormant, even in the strongest democracies. Paul Gilroy argues correctly that it is crucial in the current historical moment to re-engage with fascism in order to address how it has crystallized in different forms and in doing so "work toward redeeming the term from its trivialization and restoring it to a proper place in discussions of the moral and political limits of what is acceptable" (Paul, 2000).

Gilroy provides one more reason for educators to make the political more pedagogical and the pedagogical more political. The latter is crucial in order to recognize, as Freire reminds us, that pedagogy is always a struggle over agency, identities, desires, and values while also acknowledging that it has a crucial role to play in addressing important social issues and in defending public and higher education as democratic public spheres. Making the political pedagogical in this instance suggests producing modes of knowledge and social practices that not only affirm oppositional cultural work and pedagogical practices but also offer opportunities to mobilize instances of collective outrage coupled with direct mass action, against a ruthless casino capitalism and an emerging fascist politics. Such mobilization must oppose the glaring material inequities and the growing cynical belief that democracy and capitalism are synonymous. At the very least, critical pedagogy proposes that education is a form of political intervention in the world and that it is capable of creating the possibilities for individual and social transformation.

Ignorance now rules many countries across the globe. Not the simple, if somewhat innocent ignorance that comes from an absence of knowledge, but a malicious ignorance forged in the arrogance of refusing to think hard about an issue, to engage language in the pursuit of justice. James Baldwin was certainly right in issuing the stern warning in *No Name in the Street* that

"Ignorance, allied with power, is the most ferocious enemy justice can have." Thinking is now viewed as an act of stupidity, and thoughtlessness is considered a virtue. All traces of critical thought appear only at the margins of the culture, as ignorance becomes the primary organizing principle of American society. As is well known, former President Trump's ignorance was on display daily. Not only is he a serial liar but his ignorance also serves as a tool of power to prevent power from being held accountable. In addition, ignorance is the enemy of critical thinking, engaged intellectuals, and emancipatory forms of education. Ignorance is not innocent, especially when it proclaims the space of commonsense and labels thinking dangerous while exhibiting a disdain for truth, scientific evidence, and rational judgments. However, there is more at stake here than the production of a toxic form of illiteracy celebrated as commonsense, the normalization of fake news, and the shrinking of political horizons. There is also the closing of the horizons of the political coupled with explicit expressions of cruelty and a "widely sanctioned ruthlessness" (Mishra, 2018).

The very conditions that enable people to make informed decisions are under siege as schools are defunded, media becomes more corporatized, oppositional journalists are killed, and reality TV becomes the model for mass entertainment. We now live in a new age of cruelty in which we are told that the central mark of our agency is to be at war with others, unleash our most ruthless and competitive side, and learn how to survive in what Naomi Klein calls the "cut-throat jungle of late capitalism."

Under such circumstances, there is a full-scale attack on thoughtful reasoning, empathy, collective resistance, and the compassionate imagination. In some ways, the dictatorship of ignorance resembles what the writer John Berger calls "ethicide": and Joshua Sperling defines as "The blunting of the senses; the hollowing out of language; the erasure of connection with the past, the dead, place, the land, the soil; possibly, too, the erasure even of certain emotions, whether pity, compassion, consoling, mourning or hoping" (Sperling and Appignanesi, 2019). Words such as love, trust, freedom, responsibility, and choice have been deformed by a market logic that narrows their meaning to either a relationship to a commodity or a reductive notion of self-interest. Freedom now means removing oneself from any sense of social responsibility so one can retreat into privatized orbits of self-indulgence. And so it goes. The new form of illiteracy does not simply constitute an absence of learning, ideas, or knowledge. Nor can it be solely attributed to what has been called the "smartphone society" (Aschoff, 2015). On the contrary, it is a willful practice and goal used to actively depoliticize people and make them complicit with the forces that impose misery and suffering upon their lives.

Given the current crisis of politics, agency, history, and memory educators need a new political and pedagogical language for addressing the changing contexts and issues facing a world in which capital draws upon an unprecedented convergence of resources—financial, cultural, political, economic, scientific, military, and technological—to exercise powerful and diverse forms of control. If educators and others are to counter global capitalism's increased ability to separate the traditional sphere of politics from the now transnational reach of power, it is crucial to develop educational approaches that reject a collapse of the distinction between market liberties and civil liberties, a market economy and a market society. Resistance does not begin with reforming capitalism but abolishing it. In this instance, critical pedagogy becomes a political and moral practice in the fight to revive civic literacy, civic culture, and a notion of shared citizenship. Politics loses its emancipatory possibilities if it cannot provide the educational conditions for enabling students and others to think against the grain and where students realize themselves as informed, critical, and engaged citizens. There is no radical politics without a pedagogy capable of awakening consciousness, challenging common sense, and creating modes of analysis in which people discover a moment of recognition that enables them to rethink the conditions that shape their lives. This is the moment of hope in which as Ruth Levitas points out the sense of "something missing can be read in every trace of how it might be otherwise, how the ever-present sense of lack might be [tempered]" (Levitas, 2003).

As a rule, educators should do more than create the conditions for critical thinking and nourishing a sense of hope for their students. They also need to responsibly assume the role of civic educators within broader social contexts and be willing to share their ideas with other educators and the wider public by making use of new media technologies. Communicating to a variety of public audiences suggests using opportunities for writing, public talks, and media interviews offered by the radio, Internet, alternative magazines, and teaching young people and adults in alternative schools to name only a few. Capitalizing on their role as public intellectuals, faculty can speak to more general audiences in a language that is clear, accessible, and rigorous. More importantly, as teachers organize to assert both the importance of their role as citizen-educators and that of education in a democracy, they can forge new alliances and connections to develop social movements that include and expand beyond working with unions.

In the current moment, Freire's legacy is all the more crucial in its call to embrace critical pedagogy as a political and moral practice in order to revive civic literacy, civic culture, and a notion of shared citizenship.

Education operates as a crucial site of power in the modern world. If teachers are truly concerned about safeguarding education, they will have to take seriously how pedagogy functions on local and global levels. Critical pedagogy has an important role to play in both understanding and challenging how power, knowledge, and values are deployed, affirmed, and resisted within and outside of traditional discourses and cultural spheres. In a local context, critical pedagogy becomes an important theoretical tool for understanding the institutional conditions that place constraints on the production of knowledge, learning, academic labor, social relations, and democracy itself. Critical pedagogy also provides a discourse for engaging and challenging the construction of social hierarchies, identities, and ideologies as they traverse local and national borders. In addition, pedagogy as a form of production and critique offers a discourse of possibility—a way of providing students with the opportunity to link understanding to commitment, and social transformation to seeking the greatest possible justice.

This suggests that one of the most serious challenges facing teachers, artists, journalists, writers, and other cultural workers is the task of developing discourses and pedagogical practices that connect a critical reading of both the word and the world in ways that enhance the creative capacities of young people and provide the conditions for them to become critical agents. In taking up this project, educators and others should attempt to create the conditions that give students the opportunity to acquire the knowledge, values, and civic courage that enables them to struggle in order to make desolation and cynicism unconvincing and hope practical.

Needless to say, such a task is related to the different histories, cultures, and politics that define many of the countries still willing to connect education to a form of political, social, and cultural empowerment. What these countries can share is a notion of hope that is removed from the fantasy of an idealism that is unaware of the constraints facing the struggle for a radical democratic society. Educated hope is not a call to overlook the difficult conditions that shape both schools and the larger social order nor is it a blueprint removed from specific contexts and struggles. On the contrary, it is the precondition for imagining a future that does not replicate the nightmares of the present, for not making the present the future.

Educated hope provides the basis for dignifying the labor of teachers; it offers up critical knowledge linked to democratic social change, affirms shared responsibilities, and encourages teachers and students to recognize ambivalence and uncertainty as fundamental dimensions of learning. Such hope offers the possibility of thinking beyond the given. As difficult as this task may seem to educators, if not to a larger public, it is a struggle worth waging.

In an age of predatory capitalism and an emerging fascist politics, educators, students, and other concerned citizens face the challenge of providing a language that embraces a militant utopianism while constantly being attentive to those forces that seek to turn such hope into a new slogan or to punish and dismiss those who dare to look beyond the horizon of the given. Fascism breeds cynicism and is the enemy of a militant and social hope. Hope must be tempered by the complex reality of the times and viewed as a project and condition for providing a sense of collective agency, opposition, political imagination, and engaged participation. Without hope, even in the most dire times, there is no possibility for resistance, dissent, and struggle. Agency is the condition of struggle, and hope is the condition of agency. Hope expands the space of the possible and becomes a way of recognizing and naming the incomplete nature of the present.

Hope is the affective and intellectual precondition for individual and social struggle. Hope, not despair, is the precondition that encourages critique on the part of intellectuals in and outside of the academy who use the resources of theory to address pressing social problems. Hope is also at the root of the civic courage that translates critique into political practice. Hope as the desire for a future that offers more than the present becomes most acute when one's life can no longer be taken for granted. Only by holding on to both critique and hope in such contexts will resistance make concrete the possibility for transforming politics into an ethical space and a public act. Building a better future than the one we now expect to unfold will require nothing less than confronting the flow of everyday experience and the weight of social suffering with the force of individual and collective resistance and the unending project of democratic social transformation. At the same time, in order for resistance to take on the challenges posed by the rise of a fascist politics, it will have to develop an awakening of desire. This form of educated desire is rooted in the dream of a collective consciousness and imagination fueled by the struggle for new forms of community that affirm the value of the social, economic equality, the social contract, and democratic values and social relations.

The current fight against a nascent fascism across the globe is not only a struggle over economic structures or the commanding heights of corporate power. It is also a struggle over visions, ideas, consciousness, and the power to shift the culture itself. It is also as Arendt points out a struggle against "a widespread fear of judging" (Arendt, 2003). Without the ability to judge, it becomes impossible to recover words that have meaning, imagine a future that does not mimic the dark times in which we live, and create a language that changes how we think about ourselves and our relationship to others. Any struggle for a radical democratic socialist order will not take place if "the lessons from our dark past [cannot] be learned and transformed into constructive resolutions" and solutions for struggling for and creating a post-capitalist society (Bertoldi, 2018).

In the end, there is no democracy without informed citizens and no justice without a language critical of injustice. Democracy begins to fail, and political life becomes impoverished in the absence of those vital public spheres such as public and higher education in which civic values, public scholarship, and social engagement allow for a more imaginative grasp of a future that takes seriously the demands of justice, equity, and civic courage. Democracy should be a way of thinking about education, one that thrives on connecting pedagogy to the practice of freedom, learning to ethics, and agency to the imperatives of social responsibility and the public good (Giroux, 2019). Neoliberal capitalism strips hope of its utopian possibilities and thrives on the notion that we live in an era of foreclosed hope, and that any attempt to think otherwise will result in a nightmare. Yet, the fact remains that without hope there is no agency and without collective agents, there is no hope of resistance. In the age of nascent fascism, it is not enough to connect education with the defense of reason, informed judgment, and critical agency; it must also be aligned with the power and potential of collective resistance. We live in dangerous times. Consequently, there is an urgent need for more individuals, institutions and social movements to come together in the belief that the current regimes of tyranny can be resisted, that alternative futures are possible and that acting on these beliefs through collective resistance will make radical change happen.

Introduction

In many OECD countries Higher Education (HE) was able to attract significant investment increases over the last 20 years. This is largely due to a higher enrollment in Higher Education, increasing cost and priorities set by government and policymakers to invest in skills, research and innovation (OECD, 2020). This conclusion, made by the OECD (2020), demonstrates not only the recognized importance that Higher Education has within society, but also the expectations that are attributed to the sector, and to the overall management and governance of Higher Education systems and institutions. This managerial approach, i.e., that Higher Education should deliver socio-economic outcomes in relation to the incomes the sector has, has become more important since the 1980s, under the influence of New Public Management. Since then, it can not be denied that New Public Management has largely shaped the way Higher Education is managed and perceived nowadays. Indeed, when going through the literature on Higher Education management and governance, or on Higher Education (HE) reform, there is no doubt that the concept of New Public Management (NPM) has been enormously influential within the Higher Education sector. It has not only been a multi-layered concept used by researches or academics to describe the reality, but it has definitely been a practice—and an explicit policy—that has been applied within the sector. That concept is at the core of this article.

The purpose of this article is to provide a brief, yet comprehensive insight of the concept of New Public Management in general, and what it means within the sector of Higher Education in particular. In a first paragraph the rise of the concept within the Higher Education sector will be discussed. In a second paragraph the characteristics that NPM, as a conceptual “basket”, has, will be explained. In the final part an overall evaluation of NPM will be provided, and some insight into how Higher Education might develop over the next decades.

New Public Management and its rise within Higher Education

The concept of New Public Management has not been invented for the Higher Education sector only. In fact it is an umbrella concept to describe the gradual wave of reforms that were introduced since the 1970s in public sector organizations and administrations across the globe. Those public sector reforms were triggered by the then identified flaws and weaknesses of the public sector as a whole and traditional bureaucracy in particular. The economic, social and political context of many countries, characterized by financial crises, an overall increasing level of distrust vis-à-vis the public sector, the perceived heaviness and slowness of bureaucracy and administrative procedures, and the burden of red tape, created for many governments the momentum to introduce major public sector reforms (Pollitt et al., 2007). Those public sector reforms were said to be necessary to increase the efficiency and effectiveness of public organizations, to enhance their overall performance, to improve the quality of their services, and to better meet the expectations and needs of citizens. Looking backwards, it can be stated that this was a quite revolutionary way to look at the public sector: from the 1970s onwards it was increasingly perceived as a sector that needed to become more client-oriented, customer-friendly and efficiently working.

A key characteristic of this wave of reforms was the inspiration it took from the private sector. Despite different, yet ideal typical, organizational targets—private organizations aiming for profit vs. public organizations aiming to contribute to the public good—there was a general belief that private sector practices could improve the functioning of the public sector, by copying and applying managerial techniques that were used in the private sector: (1) input/output control mechanisms; (2) performance management,

measurement and associated audits; (3) a focus on the cost management of public organizations; (4) marketization and competition with the use of contracts for resource allocation and service delivery within public services; (5) a preference for smaller and more result oriented organizations; (6) the presence of hands-on management and the organizational distance between policy implementation and policy making; (7) entrepreneurial leadership; (8) strategic human resource management (Ferlie et al., 2008; Gruening, 2001; Osborne, 2006; Pollitt and Bouckaert, 2000; Hood, 1995; Dunleavy et al., 2005; Broucker and De Wit, 2015; Scott, 2015). Since the start of this reform wave, many public sector organizations and administrations have been modernizing according to (some of) those principles, and it has been investigated enormously with a huge amount of scholarly work as result. One of the conclusions of this research is that the basic idea of the reforms was not only highly comparable, but that it also created a kind of uniformity in managerial practice and public sector policy (Broucker and De Wit, 2015).

The list of private sector techniques demonstrates that it is no wonder that underneath the conceptual umbrella of NPM various management styles were introduced (Hood, 1995). Broucker and De Wit (2015) stated that NPM was a “toolbox” wherefrom governments seem to choose instruments as they find them appropriate or necessary (Broucker and De Wit, 2015). In this sense, the implementation of NPM has taken many forms and has been implemented with various levels of intensity and at different periods (Pollitt and Bouckaert, 2000). This was also argued by Pollitt et al. (2007, p. 4) stating that within Europe, the implementation of NPM can be compared to a “chameleon, constantly changing its appearance to blend with the local context”. And even in 1995 it was already assumed that NPM would take numerous forms within the OECD (Hood, 1995).

Given the magnitude of the impact that NPM had within the public sector, it was obvious that it would also impact the Higher Education sector—even though it would sometimes be described differently: NPM has within the HE sector been adopted under the term of the “neoliberal university”, though other names have been used as well, such as “entrepreneurial”, “enterprise”, and “innovation” university (Marginson, 2009; Peters, 2013; Scott, 2015; Frances, 2015; Ehrenstorfer et al., 2015).

New Public Management and Higher Education

Concerns that stimulated Higher Education reform

The Higher Education sector is not an isolated sector within society. The sector influences, directly or indirectly, many aspects of it: it contributes on the skills development of individuals, it fuels the labor market, it supports the increase of social welfare, it provides scientific advice to policymakers in many different policy fields. That perspective already makes it obvious that the Higher Education sector could not remain unaffected by the New Public Management wave that took place within the overall public sector. But of course, reforming for the sake of reforming is rarely done. The Higher Education sector has also been affected by many concerns, pushing policymakers to introduce reform plans in Higher Education. Bleiklie (2018) summarizes the concerns that have triggered reforms over the last decades as follows: (1) the massification of Higher Education in terms of student numbers and number of institutions; (2) the increasing complexity, expenses, and visibility of HE systems; (3) the increasing importance that is attributed to HE and research for economic growth and social welfare (Bleiklie, 2018).

The operationalization of New Public Management in Higher Education

In a time when budgetary restrictions were a challenge, reforms that could help the increase of the productivity, efficiency, and relevance of academic activities were extremely important, which is why they were launched and progressively implemented since the 1980s (Bleiklie, 2018; Amaral, 2008). The Higher Education sector, wherein universities and university colleges were traditionally managed, was suddenly challenged and influenced by NPM to be steered differently. Similar NPM-instruments as for the overall public sector were introduced within the Higher Education sector by HE policy makers, such as an increased level of marketization with the aim to increase competition and excellence, state budget cuts, institutional reforms (De Vries and Nemec, 2013; Scott, 2015). Peters (2013) states that, because of the wave of neoliberalism (conceptually closely linked to NPM), universities had to diversify their funding resources, herewith increasing competition (Enders et al., 2011; Marginson, 2014) and transforming universities into “corporate actors” (De Boer et al., 2008; Marginson, 2009). It is within this context that some universities (with the Anglo-Saxon universities often cited as example) have been charging students with larger tuition fees, resulting in large debts after graduation (Frances, 2015; Scott, 2015). Due to performance funding, universities have also attempted to expand their national audience by attracting international students, or by establishing campuses in other countries (Wilkins and Huisman, 2012). This trend has been intensified by the numerous ranking systems that stimulate competition, mainly between research-intensive universities (Pritchard et al., 2015; Scott, 2015). Universities aimed also to expand knowledge production by creating research parks, establishing public-private co-operation for research, and commercialization of the results of research and education (Marginson, 2009; Scott, 2015). The expansion of universities went hand-in-hand with the growth of the university administration and management, resulting in more bureaucratization (Marginson, 2009; Broucker and De Wit, 2015). In a more recent article, Bleiklie (2018) summarizes five major reform trends that have been implemented in Higher Education, under the influence of the NPM-ideology: (1) the development of a systemic integration whereby not only universities fall under the HE sector, but all institutions contributing to tertiary education; (2) a change in decision making model whereby the management of universities has moved much more toward a business-like model with a top-down chain of command; (3) a fundamental shift in funding mechanisms whereby HEIs are increasingly dependent on output-funding mechanisms and external resources; (4) an increased importance

attributed to evaluations and quality assurance mechanisms; (5) a fundamental shift in work organization where researchers aren't working individually but in transdisciplinary teams and/research groups.

More concretely, several authors have tried to summarize the characteristics NPM would have within HE. [Marginson \(2009\)](#) emphasizes corporatization reform, growth in student fee-charging, an expansion of the role of private institutions, encouragement of commercial business activity in research, the creation of competition for parcels of government-provided resources, and output modeling.

The OECD accentuates leadership principles, incentives, and competition between public sector agencies and private entities to enhance the outcomes and cost efficiency of public services ([Hénard and Mitterle, 2006](#)).

[Bleiklie and Michelsen \(2013\)](#) stress hierarchization (leadership and management), budgetary constraints, the formalization of evaluation, and the increased autonomy for institutions.

[Ferlie et al. \(2008\)](#) arrive at a list of ten characteristics, including market-based reforms such as the stimulation of competition for students and funding and the encouragement of private sector providers; the development of real prices for student fees and research contracts; the development of audit and checking systems; and vertical steering with stronger and more overt managerialism.

From this overview, it is clear that NPM—under a comparable logic—contains a large diversity of elements. This implies that in the actual implementation of reforms not every aspect needs to be implemented to the same extent to be able to call it an NPM reform ([de Boer et al., 2008](#)). As stated above, the same was true for the overall NPM-based public sector reforms. [Broucker et al. \(2016\)](#) compared the NPM-reforms of the Higher Education systems of 10 countries, ranging from early adopters to mid-adopters of NPM, and from varying welfare systems and different geographical regions. The authors came to the conclusion that all of them could be classified under the NPM-umbrella, despite differences related to the level of marketization, budgetary reforms, levels of organizational autonomy and management/leadership style. The authors also came to the conclusion that substantial differences between the HE systems could be identified, despite the comparable logic. NPM was indeed used as a set of instruments that a government has at its disposal and from which it can choose which instruments it will use, at different times, with a different focus, taking into account topical policy goals ([Broucker et al., 2016](#)). From that perspective the authors labeled the NPM implementation in Higher Education as widespread, but uneven. This was also confirmed some years later by a comparative study of 20 years Bologna Reform within the European Higher Education Area that stated that New Public Management has largely influenced Higher Education System reform throughout Europe, despite the many differences between systems—and sometimes even within systems ([Broucker et al., 2019](#)).

An evaluation of NPM within the Higher Education sector

In general, NPM has been criticized because of its intra-governmental focus in an increasingly pluralist world ([Osborne, 2006](#)), and because it has led to unwanted side-effects as fragmentation or diminished coordination ([Hammerschmid et al., 2013](#)). This criticism can to some extent be summarized to one issue: the fact that NPM was said to be too much focused on efficiency, effectiveness and economy. In other words: the public sector also deals with other purposes than the narrow focus that was attributed to the NPM-logic. The same criticism can be found in the HE literature. As [Marginson \(2014, p. 31\)](#) states, “the one-sided fixation with market competition [...] has obscured the rich potential [of HE] for public good.” Indeed, it was said that many social drives of HE are losing their resonance in the rush to make HEIs accountable and responsive ([Singh, 2001](#)).

Over the years, and when the impact of NPM-based reforms in HE became clearer, other scholars have confirmed that NPM has not always been to the advantage of HE. [Giroux \(2010\)](#) for instance, concludes that HE has been subjected to “a corporate-based ideology that embraces standardizing the curriculum, supporting top-down management, and reducing all levels of education to job-training sites” and he pleads instead for “shared governance between faculty and administrators, educating students as critical citizens rather than potential employees of Walmart, or affirming faculty as scholars and public intellectuals ...” ([Giroux, 2010, p. 185](#)). He proposes a system that has a legitimate place in society as a public good and that protects the equality of educational opportunities. Other examples of criticism include [Carvalho \(2015\)](#) account of the reduced autonomy of universities and grade inflation in private schools in Portugal, and [Gaethgens \(2015\)](#) assessment of the German “Excellence Initiative” that has delivered benefits for only a few HEIs. [Lim and Lund \(2016\)](#) question the persisting role of individual performance for academic careers. [Frances \(2015\)](#) criticizes the high tuition fees in the USA, which is confirmed for the UK by [Strike \(2015\)](#) where students are now facing large debts (see also [Marginson, 2014](#)). [De Boer et al. \(2008\)](#) point at “the competitive pressure” in the UK and its negative consequences. [Shattock \(2008, p. 191\)](#) summarizes the UK HE policy as follows, “tighten controls, budget cuts, freeze new appointments, campaign against waste (value of money), squeeze the system”. [Sutton \(2017\)](#) states that the university has, because of its neo-liberal focus, lost its moral norm of education as a public good.

[Broucker et al. \(2018\)](#) have stated that the criticism on NPM in HE runs parallel to the criticisms on NPM in the larger public sector. They summarize the concerns as follow: first, within Higher Education there is an increasing demand for more partnership and trust, less competition and pressure and a less narrow focus on performance alone. Second, little is known about the outcomes of NPM reforms and, though the authors above highlight to a certain extent their criteria to assess the success rate of a reform, the evaluation criteria remain vague, somehow normative and lacks objective data. One of the reasons is that it is difficult to prove that HE has become cheaper, more efficient or effective because of the NPM reform. Of course, this is also due to the nature of NPM itself: conceptually NPM is very broad and in practice NPM has been implemented very differently, which make it hard to measure in its totality. The [OECD \(2020\)](#), while also referring to the potential benefits of NPM, largely confirmed this conclusion (p. 11–12): “Public authorities in OECD member and partner countries regularly need to make and justify decisions about how to mobilize,

allocate and manage financial and human resources in Higher Education. This can be challenging, as not only are the effects of individual policy choices difficult to predict and prove, but the core objectives of Higher Education—[...] are hard to measure [...]. Governments have often sought to reshape Higher Education systems through promoting expansion and diversification of Higher Education provision or the concentration of Higher Education activities [...] in a smaller number of institutions to build critical mass, promote excellence or achieve efficiency savings. The development of new institutional and program types, as well as the expansion of private sector provision and online learning have facilitated large-scale widening of access to Higher Education in many systems. In contrast, concentration policies, including complementary specialization, institutional collaboration, alliances and mergers, have often been pursued with the aim of increasing quality and lowering costs. The success of these policies is challenging to measure.”

The fact that it is hard to prove that NPM might not have delivered the expected outcomes, makes it equally hard to develop something new for the HE sector. Broucker et al. (2018) stated that to overcome this challenge, HE as a whole should be placed back within its broader context. To study that viewpoint, Broucker et al. (2021) have compared the Higher Education systems of Flanders, Italy and Finland to understand what the effects were of the implementation of (comparable) NPM-based reforms, and why the effects were met or not. They concluded that the NPM-model was indeed dominant in those systems, despite the fact that none of the cases introduced it in its extreme ideal-typical form. From their comparative overview the authors identified similarity between HE governance instruments used, policy expectations and rationale of the (NPM-based) reform. Yet, they did see quite some differences between the effects of similar policies in different contexts. One of the conclusions of the research was that—although policy goals are generally well-defined by governments -, the goal (un-)clarity used during the reform and the (lack of) support were potentially detrimental for the implementation and the impact of the introduced policy. This conclusion clarified the lack of desired effects from the NPM-reforms, but also the difficulty in assessing the real impact of the use of NPM-related instruments within Higher Education.

What about the future?

The role and limitations of theories for HE policy

On the one hand New Public Management has probably been the dominant policy and reform model for Higher Education over almost half a century. But on the other hand the criticism is clear: too much emphasis on an economic rationale, too much pressure on output, a risk in deducing academic freedom which is deemed to be necessary for innovation, and so on. The first question therefore is: why is it still then so present within Higher Education? Tight (2019) summarizes it as follows. First, Higher Education is not an island within society. Nations worldwide have adopted neoliberalism within their overall economic and social policies. It is no wonder that it has affected Higher Education, and that Higher Education cannot stand apart from this. The contrary would not only be strange to witness, it would also be counter-productive for the general policy. Indeed, as stated above already, Higher Education contributes to social welfare and the labor market. Policies developed for those two policy fields can not be completely detached from Higher Education. It is likely to say that a neoliberal policy in key domains will influence other policy domains as well.

Second, it seems as if policymakers don't see a valid alternative to neoliberalism and New Public Management. This acceptance by the persons who are responsible for Higher Education results into an adoption of NPM-principles across the sector. Moreover, as stated above, as long as it remains hard to evaluate thoroughly the effects, it will be hard to develop an alternative—because the question about whether an alternative would be necessary remains unanswered.

Third, the large number of characteristics of NPM in general, and the whole range of connected ideas and initiatives, have a multiplying effect on the Higher Education sector. It has such a large impact on Higher Education in general, and on its stakeholders (researchers, students, administrative staff, ...) that it cannot just simply be reversed. On the contrary, staff for instance will remain expected to be excellent in what it does, and herewith it confirms the principles that have influenced Higher Education over the last decades.

The second question to be addressed is: how can Higher Education maintain the potential benefits it has gained from New Public Management, and simultaneously address its identified weaknesses? Because this is what policy should do and normally does: iteratively improve what can be improved. Within the literature a large number of alternatives can be found already. In their article, Broucker et al. (2017) have discussed those NPM-related theories. The authors identified three large categories of theories. A first group of theories that are in fact an application of NPM (i.e., (new) managerialism and academic capitalism). A second group of theories that propose adaptations to the NPM-model (network governance, new public governance and public value): those theories address the issues that NPM has been blamed to neglect, such as collaboration and interdependency. They start from the observation that HE can at best be a quasi-market, that government steering remains strong, and that universities, the state, and other actors external to the university are interdependent and connected in a network structure. And a third group of theories that are seen as a reaction to NPM (shared governance, flexible governance). Those theories take a step away from the NPM framework and managerialism, and focus on the internal working of universities. They stress the interdependence and need for cooperation between the internal stakeholders. Broucker et al. (2017) conclude that theories in this cluster are a way of rethinking NPM, and re-emphasizing collaboration within institutions as an important factor, be it for an *effective* and an *efficient* policy.

The complexity of those theories is that even within each category of theories different applications can be found and that between categories gray zones exist. Moreover, it is also no wonder that when it comes to theories related to Higher Education that they are linked to ideology, political ideas about the role of HE in society, or normative impressions about the labor market, the welfare state, or others. This is what Tight (2019) referred to when stating that Higher Education cannot be detached from

overall policy and its implications in the economic and social context. Despite the usefulness or the inspiration other theoretical models might bring, their real value are equally hard to assess. Therefore the authors state in another article that it is crucial to look at the overall context of a Higher Education System to be able to fully understand what can be considered as a flaw and what not; similarly that context will better highlight whether NPM as a model is useful or not, and how large the number of identified flaws is (Broucker et al., 2018). Doing so, Higher Education will much more benefit from theories and models.

Maintaining benefits from NPM, contextualizing policy and broadening the perspective

It is the role that HE is expected to play within society that should be at the core of the debate when talking about HE policy and benefits. What do stakeholders want from Higher Education? This role will be differently defined according to the ideology that guides the opinion of stakeholders (Broucker et al., 2018). The discussion about the benefits of HE should be equally broad. Next to efficiency and performance (NPM-values), other benefits and aims should be considered, by looking at all objectives defined by the relevant stakeholders, so that can be assessed whether reforms are aimed at building a HE that is functional for the achievement of those objectives (Broucker et al., 2018). When discussing NPM, several important nuances need to be made.

First, it's not all black and white: when Higher Education is built in a country that puts large emphasis on equal opportunity, it is logic that the entrance barrier to Higher Education will be kept as low as possible. But it also implies that there might be a large number of students failing in the first year, because they all have the opportunity to try it out. From a NPM perspective one can argue that this is inefficient. But from the ideology of democratization it is logic that this inefficiency is seen as necessary, and even expected. The question is whether on the longer run society will be better off. And if so, then one can ask whether that is still inefficient or not? In other words: what seems to be ineffective on the short term, can become effective on the longer term. A lot depends on the perspective one looks at a system. The contrary can also be witnessed: in a country that puts liberalism as a model much more upfront, it is logic that the individual will be much more responsible in entering Higher Education. This can result into a situation where less students are able to enter Higher Education, with a lower level of study failure in the first year, and thus with a higher level of efficiency. But then the question is what that effect will be on the labor market and social welfare in general? Of course, reality is much more complex than what those two examples seem to indicate: Higher Education systems that put democratization high on the agenda quite often build rules to avoid that students repeatedly fail in Higher Education, because otherwise the financial burden would become too heavy. And vice versa: Higher Education systems that are built as elite systems build in measures to attract bright students who do not have the necessary financial means to study. This means that in both cases NPM-measures can be applied, to a different degree, but at the same time counterbalanced by other measures to take out the potential sharp edges of the consequences of an ideal-typical implementation. How much is a theory than worth if it is only exceptionally witnessed in its "pure" form in reality? How much "NPM" has then been implemented—and how can NPM then be assessed, or even compared?

Second, it's not only about the policy or the instruments. It's about the context and the customization of principles and policy instruments to that context. Howlett (2019) came to a similar conclusion when stating that researchers should pay more attention to the appropriateness and preconditions of policy instruments rather than on the implemented instruments and their goals. Here-with the argument is that policy implementation needs to be put again into the policy process. Thus: within the context. Broucker et al. (2021) highlighted in their research that emphasis should be put on the implementation *feasibility* of each governance instrument, instead on the instrument as such. In other words: studying NPM, how it has been implemented and which characteristics were used, is fine; but studying under which circumstances it has been introduced in a system might provide more insight into its usefulness and into the reasons why it has been successful or not. Indeed, this will increase insight into successful governance approaches, and allow policy makers to better take into account organizational path dependency and contextual/cultural characteristics. The way NPM- (or other-) instruments have been adapted to the specific political, social and economic context and the organizational/national values and culture are in this respect more crucial for successful implementation than the choice of certain instruments for specific expectations. And this will much better fuel or evaluation of NPM. Obviously, it needs to be acknowledged that this customization already happens to some extent: it was already highlighted that only very few countries adopted the NPM-governance model in its most extreme form, though customization needs to be improved.

Third, nothing is fixed in stones. Reform often takes quite some time, and over time principles might change and managerialist approaches might also shift over time. This implies that at different stages, over time, the definition of how a governance model is understood, can differ. The difference between policy formulation and policy implementation is also crucial to take into account. Important is also to acknowledge that governments tend to first define strategic goals and then to implement the respective reforms for the achievement of those goals. Broucker et al. (2021) highlighted that *along the way* goals do not necessarily change, but policy instruments do. Governance mechanisms are then adapted to increase reform acceptancy, and to leave out potential sharp edges of certain (in this case market-oriented) reforms. Hence, it would make more sense to first determine established, supported and unambiguous goals—in order to in a second stage define an adapted (mixture) of governance instruments that would allow the achievement of those goals. This helps to understand which governance techniques work under which circumstances, and which not. Policy implementation studies could benefit to further elaborate on this. Another issue is that the role of HE in society is not value-free, and research in that domain always risks to reflect certain preferences regarding that role in society.

Fourth, there is no need to throw away the baby out with the bathwater. As the NPM approach has a neoliberal ideological background, it is tempting, even for scholars, to be for or against that ideology and approach. But it has to be acknowledged that the dominant NPM approach has had not only negative but also positive effects. Even when arguing that efficiency and effectiveness are too narrow as a goal for HE, it cannot be denied that in many ways efficiency and effectiveness have been increased and this has

been to the benefit of HE (Broucker et al., 2017). Broucker et al. (2017) have therefore proposed a public value model that does not replace NPM for Higher Education, but that puts HE back into the arena of dialog between stakeholders—and where other than economic principles are present. A holistic view on Higher Education and its role in society, and a better insight into the different logics that are applied to Higher Education will provide both researchers and policymakers a better understanding of what Higher Education is, and what it should do. It will also provide a better idea of the needed adaptations, and the created results. And finally, it will avoid to narrow the debate to the implementation and criticism on NPM. Instead, it will help to rediscuss and reposition the role of Higher Education within society and consider NPM—or any other theory driven policy instruments—as a mean to that explicit end.

Some conclusions

There are several conclusions to be made from this article. First of all, New Public Management has become a dominant model for the public sector and the Higher Education sector. Its managerialist approach has pervaded Higher Education systems and institutions across the globe, and it has infiltrated in every aspect of Higher Education (Shepherd, 2018).

Second, it has been studied extensively in many different ways: in literature an enormous amount of case studies about NPM-implementation can be found, and the same goes for research reports on the way NPM has characterized Higher Education in its funding, performance management or other organizational features. Likewise, the outcomes of NPM have been discussed, though they are not easy to assess (see also OECD, 2020), the criticism on the model is known, and alternative theories have been developed. Though NPM remains an important organizational model, it is said to be replaced by New Public Governance (Shepherd, 2018)—though Broucker et al. (2018) have highlighted that this model is merely an adaptation of NPM, and not a replacement. This also implies that NPM will not just simply disappear; it has influenced other approaches, but several basis principles will remain—be it in a less “extreme” form.

Third, and linked to the previous: the basic principles of NPM are not disputed. As already stated: most Higher Education systems want to be efficient—as this is to the benefit of society. But what is disputed or criticized is its sometimes narrow focus, be it on the organization of HE, be it on its objectives, be it on how it has been implemented. It cannot be neglected that many countries have followed the NPM route, as there probably is no valid alternative up until now that is capable to fully counter the identified deficiencies of NPM: either alternative theories do not integrate the importance of other values and other stakeholders; either they minimize the importance of external partners and their influence; either the theories elaborate on NPM but are hard to operationalize. This highlights that NPM as a concept is in itself perhaps too vague, even though this can also be seen as a strength: HE systems are free to use it as they see fit. Moreover, none of the alternative theories are against efficiency or effectiveness. Most theories are against the fact that these would be the only objectives, but at the same time, even NPM is not against collaboration or interdependency, as long as it is for the benefit of efficiency.

Fourth, what cannot be neglected is that NPM *in practice* is the operationalization of an ideology into a policy. There is no doubt that the criticism first starts with what went wrong in the development or implementation of the policy, and that the critique is then in a second stage transferred to the ideology itself. But the fundamental issue however remains: the way HE policy is described and studied runs the risk of being either one-sided, or conceptually (too) complex. What is needed is a more comprehensive theory or a multi-dimension theory that not only take into account the ins and outs of Higher Education, the way it should be organized to achieve the stipulated results, or the role of management in Higher Education institutions. What is needed, for both researchers and policymakers, is a more detailed picture about Higher Education, and a model that is both perspicuous and able to catch the complexity of HE policy in itself, its role within society, the values it is built on, and the stakeholders it involves. NPM was in the beginning an answer to a range of problems that were identified in many countries, and what is needed now is to take the debate further, i.e., to rediscuss the specific customization of principles to the societal context, just because contexts change and new challenges emerge. And in order to be able to do it is necessary to reflect on the role of Higher Education in society nowadays. That question could put the debate on HE back into its social, political and economic context, herewith broadening the debate on what HE should do (efficiency vs. socio-economic development)? The empirical investigation of the role of HE in society could provide inspiration for the theoretical approach toward HE. In a second stage, more international, multidisciplinary and comprehensive research is needed on the impact that NPM-driven HE reforms had. The answer on that question would provide insight into the effects of concepts and theories when they are used as an ideological basis for reforms, and thus provide insight into their value for HE research and policy. A focus on the effects of past reforms and the role of HE in society could open up the debate on what governance of HE for the next decades could be, while respecting the policy options of the past, and could be the ground for integrating the different theoretical paradigms into a coherent framework, allowing to grasp HE to its full extent.

Introduction

To understand governance and institutional autonomy in Portuguese higher education, the regulation impact of the changing governance models is of key importance. The Portuguese higher education system is binary comprising universities and polytechnics, both public and private. Higher education institutions are under the supervision of the Ministry of Science, Technology and Higher Education. Universities aim at guaranteeing scientific, cultural and technical education, and create knowledge, develop innovation, critical and professional competences. Polytechnic institutions focus on applied research and vocational and advanced technological training. Since their inception, they were expected to respond to regional needs and lifelong learning demands. In Portugal, there are 14 public universities and 27 polytechnics, and 23 private universities and 50 polytechnics.

New Public Management (NPM) drove Portuguese higher education governance reforms, however elements stemming from other governance approaches (e.g., Network Governance and New Governance) also emerged mainly as a reaction to the implementation of NPM reforms. The regulation efforts developed at the national level echo a trend toward meta-governance (Peters, 2010) that is also visible at the institutional level. Higher education institutions and their leadership need to ensure that their organizational objectives are to be attained in a context where actors and governance and management bodies enjoy pedagogic and scientific autonomy.

Institutional autonomy was widely assumed as a regulation instrument to politically steer public systems and institutions, aiming at implementing governance models that might adequately respond to competitive and ever-changing environments. The consensus about awarding autonomy to higher education institutions and the need to increase self-governance creates the need that governments make sure that their goals are actually taken into account, enhancing the instrumentality of regulation mechanisms. While there is a wide consensus about the attribution of autonomy to higher education institutions and the need to increase self-governance, the pursuit of public goals as represented by the governments leads to the reinforcement of their regulation frames. Similarly, institutional leaderships need to guarantee that the goals and strategies set out at the central level are actually pursued at other organizational levels, regardless of the fact that they are aligned horizontally or vertically in the decision-making processes (Magalhães et al., 2012).

The Portuguese case illustrates how governance reforms impact on institutions and how these reforms correspond to meta-governance efforts in the aftermath of the introduction in 2007 of a new legal framework. Common organizational behaviors directed toward competitiveness, accountability and quality promoted by the dissemination of a common grammar on funding and quality issues were induced (Magalhães et al., 2012).

In the first part of the article, we argue that the prevalence of governance, both as a concept and political practice, over governing corresponds to the reconfiguration of Portuguese state regulation in the field of higher education. This had implications on autonomy and on the framework within which leadership evolves at the institutional level. In the second part, the focus is on the impact of governance reforms on internal governance and management structures and on the reframing of institutional leadership.

Changing state regulation

The state control model implied a cleavage between governing and governance. The former was specially directed at tracing social objectives and goals, and the latter focused on managing the processes and the instruments for their achievement. State officials and

bureaucrats, as professionals of administration, were in charge of translating governmental objectives into norms and regulations, and applying them (Peters, 2001, 2010). Under this model, governance appeared, at least formally, as an articulated set of human and material resources, and organizational structures to serve governments' objectives and goals. In this sense, and in spite of the "technicality" and specialization of the professionals in charge of governance activities, there was supremacy of government over governance. In the 1980s, across Europe the model of state control was replaced by the model of state supervision in which the central government administration downsized its interference in the daily decisions of institutions. In line with this, institutional autonomy enhanced the self-regulatory capacities of the system and of higher education institutions to promote the public good.

The fragmentation of decision-making processes in public affairs and the increasing influence of non-state actors brought to the fore the issue of how to politically steer autonomous and potentially self-governing organizations. The meta-governance perspectives (Peters, 2010) underline the need to ensure the fulfillment of the policy objectives traced at the central level. The literature on regulatory governance (Baldwin and Cave, 1999) has already been looking at the interaction between the regulator's discretion and institutions' autonomy. Lodge (2003, p. 159) has underlined constraints inherent to the regulatory frames and "the institutional factors that structure relationships between the policy domain and its environments". Actually, the absence of formal authority and legitimacy, central to traditional settings of government, started being dealt with governance structures and processes that cannot be reduced to a mere delegation of competencies.

In Portugal, the influence of New Public Management (NPM) on the 2007 Legal Framework for Higher Education Institutions (RJIES) (Portugal Ministério da Ciência e do Ensino Superior, 2007a) reshaped the relationships between governing, governance and management. Although there is not a consensual definition of NPM, it represents the idea that governments should maintain and preserve only a minimum of public services while emphasizing the need to attain the objectives and the results aimed at. Efficiency and effectiveness are to be achieved through management instruments used in the private sector, specifying goals, emphasizing competition for clients, performance measurement, de-centralization of decision-making and the use of markets to regulate public services (Meek, 2003).

Detailed control instruments have been set up "over and above that control and oversight traditionally exercised through legislative and legal procedures" (Neave, 2008, p. 10). Neave argues that these instruments were the main driver for the reforms undertaken in higher education. Under the influence of NPM, in the last decades the narratives on the enhancement of institutional self-regulation have reinterpreted the meaning of institutional autonomy in the field of public policies. This trend promoted the technicality of the governance and management instruments enhancing the managerial structures and processes within European higher education institutions (Bleiklie and Kogan, 2007), Portugal included.

A tension emerged between the reconfiguration of state regulation and the instruments stemming from it with impact on the relationship between governance and management. Governance is about political management of rule systems, both formal and informal, that drive values and norms affecting actors and constellations of actors' behaviors and attitudes (Hall and Taylor, 1996; Kjaer, 2010). In turn, management refers to the implementation of the objectives set out by the governance structures on the basis of established rules and it is concerned with the efficiency, effectiveness and quality of services provided to internal and external stakeholders (Eurydice, 2008).

The tendency to subsume governance to management is visible in the Portuguese higher education context (Magalhães et al., 2017). This trend evolved under the fixation of meanings attributed to governing, governance and management. Governing refers to the actions taken by the government to politically steer social systems. In turn, governance, in a narrower sense, refers to the actions taken for the achievement of policy goals in dealing with increasing fragmentation of public decision-making and the degree of interdependence between state and non-state actors of civil society. Referring to this fragmentation, Peters (2010) underlines the need of meta-governance:

I shall be using the term "meta-governance" to describe the process of steering devolved governance processes. In other terms, it is the "governance of governance". The notion of meta-governance is that a number of organisations and processes within the public sector have attained a substantial degree of autonomy — a condition better described as governance — and that there may be a need to impose some control over those components of governing

(Peters, 2010, p. 37).

The regulation efforts undertaken at the European and national levels reflect a trend toward coordination of devolved governance processes by enhancing the State regulation frames and meta-governance efforts. Research has underlined that when higher education institutions are forced to compete among themselves, particularly in a context of financial stringency, they tend to pursue their "own good" rather than the "common good" as represented by the governments' objectives and goals (Amaral and Magalhães, 2007). The need to coordinate organizational subsystems and actors also raises the issue of meta-governance at the institutional level, making more complex the relationship between governance and management structures and actors.

Autonomy, accountability and quality assessment became keywords in the last decades of policy-making in higher education (Magalhães, 2004) and its governance arrangements. Institutional autonomy is supposed to increase organizational awareness about changes in the environment and is assumed as a fundamental political instrument in market-driven regulation contexts. The organizational awareness of external transformations is particularly substantiated in the presence of external stakeholders (Magalhães and Amaral, 2000) in the governance structures of higher education institutions. The concept of representation of external interests in higher education in the governance of institutions simultaneously transforms internal actors into stakeholders.

Awarding autonomy reshapes the relationship between state and higher education institutions. In political terms, this is visible on a contractual relationship “governed” by the state that does not weaken or diminishes in extension and intensity its regulation. Neave (2008, p. 10) argues:

One of the most significant achievements — indeed, an indispensable condition for re-defining the relationship between Nation and university these two decades past, has been the setting up of a powerful, relatively precise and detailed instrumentality over and above that control and oversight traditionally exercised through legislative and legal procedures.

Neave also argues that this increased instrumentality in higher education was the main driver for the reforms undertaken in the sector. The transformation of the regulation relationships replaced a priori control by a posteriori control referred to institutions’ outputs. This induced the elaboration of instruments based on performance indicators that spread all over Europe (e.g. financing while incentive, in Denmark and financing referred to performance in Sweden). In this context, collegial governance is being challenged by the enhancement of managerial governance and reconfiguring the meaning of institutional leadership, as illustrated by the Portuguese case.

Higher education governance reform in Portugal

Since the mid-1990s, debates in Portugal about institutional autonomy have highlighted a tension between institutional autonomy granted to higher education institutions by the 1988 Autonomy Act and the need for stronger regulation by governments, and more efficient decision-making structures and processes.

The implementation of the governance reforms of Portuguese higher education has been developed under the influence of NPM resulting in the loss of collegial governance and enhancement of managerial self-regulation. The NPM perspective is visible in discourses stimulating competition for students; in the hardening of budgetary constraints; in the vertical steering of the system by setting explicit targets and using performance contracts; in the market-based research funding; in the development of a “management must manage” perspective; in the emphasis on stronger managerial roles of rectors, deans, heads of department; in the focus on efficiency and value for money; in the development of strong central administrations and in the weakening of the representation of faculty in higher education management (Paradeise et al., 2009). Managerialism has been driving the changes incorporated in the new legislation (Magalhães and Santiago, 2012). Among the political drivers of these reforms, the most relevant are the move to appointed rather than elected posts; weakening in the representation of the constituencies of higher education institutions; stronger managerial roles of rectors, deans and heads of departments and private-sector style of human resources management (Amaral et al., 2013). These drivers resulted in an increasing centralization of power at the institutional top, suppression or weakening of the collegial decision-making bodies and the strengthening of the presence of external stakeholders in the institutions’ governance structures.

The need for meta-governance of the higher education system and institutions to monitor institutional performance against policy objectives has become evident. In examining the impact of the implementation of the legal framework for higher education, established in 2007, previous research (Magalhães et al., 2013) has revealed that the New Governance perspective allows a broader interpretation of the governance reform outcomes. From this perspective, Salamon (2002) identifies the governance approach to public issues by pointing out characteristics such as: (a) focus on governance techniques rather than on state programmes; (b) focus on networks rather than on hierarchy; (c) shift from public versus private to public plus private; (d) shift from command and control to negotiation and persuasion; (e) shift from management skills to enablement skills. In the Portuguese context, the shift from management to enablement skills have the potential of identifying specific features in the development of the process of reframing institutional leadership in the Portuguese context.

By 2009, Portuguese higher education institutions had already adapted their statutes to RJIES (2007). As already mentioned, existing research reveals that this legal framework strengthened organizational rationales such as empowering managerial bodies to the detriment of collegial bodies, centralization of decision-making processes and the presence of external stakeholders at the central and faculty/department/school level (Amaral et al., 2013). This legal framework also offered the possibility to adopt a foundational model enabling institutions to rule themselves by private law. This model enhances output-based contracts, accountability, individual responsibility and performance. Five universities and one polytechnic have joined this model and others may be pursuing the same purpose.

Institutional autonomy allows higher education institutions to declare their mission, define their statutes, manage their resources and carry out their activities within a self-regulation rationale, which did not substantially change under RJIES. However, the legal framework for the development of quality in higher education, based on the compulsory accreditation of higher education institutions and of degree programmes reduced to some extent pedagogic autonomy. RJIES reinforced the notion that the autonomy of higher education institutions does not preclude either regulation by the Ministry, or accreditation and external evaluation under the responsibility of the National Agency for Quality Assurance and Accreditation (A3ES). The legal framework for quality evaluation and accreditation passed in 2007 (Portugal Ministério da Ciência e do Ensino Superior, 2007b) determined that higher education institutions should develop a quality assurance policy for their programmes, a culture of quality, quality assurance mechanisms and a strategy for their continuous improvement.

Next, we will look at the internal governance and management structures resulting from the interpretation of RJIES by higher education institutions.

Institutional governance and management structures

Under the influence of NPM, collegiality as reflecting social capital (Dill, 1995) and empowering academics and their networks is decreasing in favor of the prioritization and development of control mechanisms by institutional leadership. The RJIES gives higher education institutions some leeway to create diverse [optional] organizational structures depending on individual institutional contexts. For instance, institutions may opt for being a public institute or a public foundation, the latter seen as a stronger expression of privatization. On the one hand, they may counteract a bolder emergence of NPM by creating optional structures that promote the participation of higher education constituencies in institutional governance. Therefore, the ways higher education institutions implemented RJIES may also be diverse in combining NPM with elements stemming from other governance perspectives. In fact, other governance perspectives have been developed, interacting with NPM, to “make sense of the rise of horizontal rearrangements within higher education systems, in relation with the emergence of new actors in new arenas” (Paradeise et al., 2009, p. 243). This is the case of New Governance approaches that emphasize a shift from hierarchy to networks, from command and control to negotiation, and from management skills to enablement skills (Salamon, 2002).

In 2008 and 2009, Portuguese higher education institutions adapted their organizational and governance structures to RJIES. According to the legal framework, higher education institutions are free to draw up their own governance bodies, but it specifies the main governance structures — general board, rector (or president) and management council. In the case of universities, the law gives leeway for the possibility of adding advisory bodies. The senate, which was an academic structure under the Law of Autonomy (1988) with decision-making capacity, either no longer exists or became an advisory body that should be consulted by the rector in terms to be specified in the statutes of individual institutions. The law makes compulsory the participation of internal and external stakeholders in the general board. In the foundations, the governance bodies are the board of trustees and the auditor. The government appoints the board of trustees, which is composed of external stakeholders recognized as highly qualified and with relevant professional experience, following the proposal of the general board of the higher education institution.

The role and power of academics and students in the governance bodies have changed challenging collegial governance. The centralization of power at the top governance bodies and reduced membership affected the participation of academic staff, students and non-academic staff members. The participation of external stakeholders representing 30% of board members is potentially influential in contributing to the strategy and performance in the core business of higher education institutions. This change is noticeable, for instance, in the limit set by law of 25 members total in the membership of scientific or pedagogic councils, irrespective of the size of higher education institutions. To mitigate this effect and to counterbalance the underrepresentation of faculties/schools/departments in the governance bodies, some higher education institutions have created advisory bodies that can be seen as elements of a focus on the enhancement of academic networks (Magalhães et al., 2018). From the New Governance perspective, building academic advisory bodies can be seen as a guarantee that academics could be involved in decision-making processes.

The rector/president is elected by the general council, but directors at the middle management level are elected by a collegial board (optional by law, though) based on individual action programmes. This means that while the legitimacy of the rector/president among academics is weakening, at the middle management level, the empowerment of directors potentially increases. In other words, decision-making takes place at the various levels but the rector/president reports to the general council and not directly to the academic community.

Higher education institutions have room of maneuver to develop their own statutes, including the definition of the structures at the middle management level when the sub-units (Faculties/Schools/Departments) have self-governing bodies. This brings to the fore the role of institutional leadership in determining the internal governance structures of their institutions. Curiously enough, at the middle management level collegial governance has, to a certain extent, been maintained as the institutions’ board of representatives elects the director of the Faculty/School. The tension between the elements of NPM and those stemming from collegial governance is made visible in the redistribution of academic power in decision-making processes. Actually, research has been showing different weights of managerialism in the governance processes and structures substantiating the relationship between hard and soft managerialism (Magalhães et al., 2017).

Centralization of power at the top of higher education institutions may not be as effective as it might be expected by central administration as decision-making processes are fragmented across the central administration and middle management levels. This calls for meta-governance efforts influenced by top-down managerial perspectives. A hierarchical relationship is established between the governance bodies at middle management level and the governance bodies at the central level. This relationship is aimed at guaranteeing the alignment of strategies, accountability and the intervention of central-level governance bodies, thus signaling institutional top-down control.

The RJIES deviates from a legitimacy principle based on traditional democratic elections but without imposing a pure top-down system of appointments. However, in spite of the increase of the nomination as constitution principle of the governing bodies, election remained not favoring a clear top-down command chain. Additionally, as RJIES determines that “The General Board members do not represent groups or sector interests and are independent in the performance of their duties”, elected professors, researchers and students, after election, no longer represent the interests of those who elected them, thus counteracting democratic principles.

The mixed character of the selection procedures of some members of the governance bodies, together with the basis of democratic legitimacy of elected individuals, is not conducive to see either command-and-control or negotiation-and-persuasion prevalence. This might create governance problems as legitimacy is fragmented between representativeness and the hierarchical line of decision-making and implementation. For instance, and as already mentioned, in some higher education institutions a tension can be found as directors, at the middle-management level, are elected by a collegial board. Directors or presidents of faculties/

schools report to the council of representatives or to the faculty council, which might create difficulties in developing strategic action plans approved at the faculty level as they might not fit into the institutions plan (Magalhães et al., 2013).

The mixed character of RJES allows for the development of horizontal power relations and addresses an important dimension underlined by the New Governance approach. However, collaboration and negotiation will depend on the characteristics of institutional leadership. This raises the question of management skills versus enablement skills.

Reframing institutional leadership

In Portugal, the RJES differentiated the purposes of universities and polytechnics and institutional autonomy gives centrality to the role of the general boards. They approve medium-term strategic plans presented by the rector/president, his/her action plan for four years, the scientific and pedagogic guidelines and the budget proposal. The influence of external stakeholders might reinforce the local and national strategic priorities easing the establishment of active partnerships with the society (Magalhães et al., 2013).

An important aspect to be underlined within meta-governance efforts at the institutional level relates to the need to specify operational objectives, the relevant activities to fulfill those objectives and scorecard instruments to measure the degree of their achievement. The emphasis on institutional meta-governance stresses the enhanced capacity for institutional self-adjustment and potentially accelerates the dynamic of system change from within. Managerial perspectives influence the development of these instruments stemming from the need to demonstrate results to external stakeholders, such as the ministry, and those coming from the corporation and business world. The adoption of a management jargon such as “strategic maps”, “indicators”, “metrics”, “action plans” and “monitorization” is being disseminated as a translation of what higher education institutions are about, increasing the instrumentality of their mission statements.

While contracts may improve the capacity to act strategically they also potentially reduce the autonomy of higher education institutions reflecting the paradox of this type of regulation (Amaral and Magalhães, 2001). As stressed by Neave (2008), the development of governance instruments to coordinate institutional autonomy appears as a step toward stronger and potentially more intrusive relationship between state and higher education institutions. This is also valid for the foundational institutions that under private law enjoy a broader room of maneuver at administrative and financial levels. The foundational model broadens the possibilities of strategic management, since the government funding is based on a 5-year contract program. In addition, the erosion of collegiality, the promotion of the participation of external stakeholders and the centralization of power at the top of the institution are key to understand the reframing of leadership at the institutional level.

Additionally, the emphasis on management and leadership can also be identified in the Portuguese governing and governance of higher education. Governance and institutional leadership can be pointed out as key factors in Portuguese governance reforms featured by the enhancement of managerial self-regulation governance, decrease of collegial governance and strengthening of the role of external stakeholders in the governance bodies (Veiga et al., 2015). Collegial bodies are being re-configured, in a tension, as stressed by Neave (2012, p. 177), “between the values associated with ‘collegiality’, on the one hand, and ‘managerial’ rigor, on the other”.

From the perspective of New Governance, the shift from management to enablement skills is at the core of the reframing institutional leadership. This shift is required to engage partners arrayed horizontally in networks and to bring in multiple stakeholders together for a common end in a situation of interdependence (Salamon, 2002). While the NPM approach also moved the emphasis from control to monitoring the performance, its central concern remains in the functioning of internal management based on management skills.

Signs of the shift from management skills to enablement skills are to be found in the role of the rector/president that, according to the RJES, he/she is expected to elaborate and submit the strategic plans, the guiding principles of the institution focusing on scientific and pedagogical issues, plans and report plans to the general board for approval. The limitation and decrease of representativeness of all constituencies in the structures governing higher education institutions is more visible in the approval of strategic plans. The general board is expected to approve the strategic plans of each individual faculty/school, asking for reformulation, or even rejecting those plans that do not align with the strategic plan of the higher education institution. Coordination difficulties may not allow for aligning strategic action at middle-management level with the central administration. This creates tensions between structures and processes and it is difficult to see a clear shift to enablement skills.

The relationships between the rector/president and the general board, together with the underrepresentation of the constituencies in the governance bodies, make the analysis of the shift from management to enablement skills also highly complex. Apparently, the command-and-control governance features promoting management skills do not match with the organizational specificities of higher education institutions. The shift must go along with the move from a hierarchic organization to a horizontally networked organization that is still embryonic in the Portuguese context (Magalhães et al., 2018).

Conclusion

In Portugal, the features of NPM were softened in the interpretation of the legal framework by higher education institutions by ingredients stemming from other governance perspectives. This corresponds to a European trend as pointed out by existing research (Paradeise et al., 2009, p. 243).

The Portuguese case also shows an embryonic trend underlining networks rather than hierarchy, being the characteristics of the institutional leadership also shaped by the need and, in some cases, the demand to enhance enablement skills. The multiplication of managerial bodies induces the existence of a wide range of mechanisms that while fragmenting the decision-making processes gives leeway to collegial bodies to make a stance in institutional governance.

Finally, the analysis of the Portuguese governance reforms from the perspective of New Governance opened vistas about new features developed together with NPM as it emphasizes the importance of promoting enablement skills to cope with management challenges on the basis of interdependencies and networks. This also goes beyond the Portuguese context to the degree that enhancement of institutional autonomy is a core issue in European governance reforms.

Introduction

The phrase “publish or perish” has traditionally been linked to a particular understanding of academia as a primarily research-oriented meritocracy. At many academic institutions around the globe, merit in research tend to be perceived as more important than merit in teaching and other academic duties. Promotions, pay raises, research grants, academy memberships and other forms of academic rewards are very often granted primarily based on the recipient’s research achievements. This reward structure also has a tendency to be self-reinforcing: the more you have published, the more likely is it that you can get additional research funding, and the more additional publications will you be able to produce. The academic reward structure is therefore often perceived as producing a very strong pressure on academics to publish as much as possible. The phrase “Publish or perish” expresses this pressure.

The phrase has been used at least since the first half of the 20th century (see e.g., [Case, 1927](#); [Wilson, 1942](#) for early examples). In academic novels, such as, for example, Kingsley Amis’ (1954) *Lucky Jim*, or James Hynes’ (1997) *Publish and Perish: Three Tales of Tenure and Terror* it is a frequently depicted theme how success in academia is tied closely to publishing, and vice versa, that failure to publish is the road to academic perdition (see e.g., [Moseley, 2007](#); [Tierney, 2004](#) on the publish or perish theme in academic novels).

At many institutions around the globe, the focus on achievements has gradually widened to include not only on the amount of research that a scholar has published, but also the impact that this research has had in the academic community. Reflecting this developments, the phrase “publish or perish” has been supplemented with a number of additional phrases that express the need not only to publish, but also to produce publications that will be read and cited by others, such as for example the expressions “impact or perish” ([Biagioli, 2016](#); [Biagioli and Lippman, 2020](#)), “be discoverable or die” ([Doyle and Cuthill, 2015](#)), or “get visible or vanish” ([Doyle and Cuthill, 2015](#)).

This entry will provide a brief overview of several facets of the “publish or perish” idea. First, it will describe the role that publications play as one factor among others in academic careers. Further, it will describe how the strong emphasis on publications in the academic reward system has been vindicated by early work in sociology of science. Next, it will review some of the ways in which scholars’ research achievements are assessed today. Finally, it will describe some of the adverse effects of current assessment practices, and it will discuss some of the points of criticism that are today raised against the publish or perish doctrine.

The role of publications in academic careers

Globally, there is a great deal of variation in what is considered important for succeeding in an academic career ([Altbach, 1996, 2016](#); [Boyer and Altbach, 1997](#); [Boyer, 1990](#)). Not only are there important differences on a global scale, for example between the Global North and the Global South (see e.g., [Cloete and Maassen, 2015](#)); there are also important regional differences, for example between the individual European countries, or between, for example, research-intensive and teaching-intensive institutions in the US ([Boyer, 1990](#)). It is therefore difficult to give a unified treatment of the role of publications in academic careers that gives justice to all local variations.

Rooted in the idea of the research university as it developed in Europe and North America during the 19th and 20th centuries, there has been a strong tendency to base hiring and promotion decisions primarily on research achievements, especially at research-

intense universities. At the same time, it has varied widely between institutions, between countries, and between fields, how this focus on research achievements has been implemented. In some fields and in some countries, regular publication of specialized monographs is necessary in order to be seen as a serious academic—even if at the same time it is discussed whether this version of the publish or perish doctrine leads to an overproduction of monographs (Lewis, 2002; Waters, 2001). In other fields and in other countries, journal publications are at focus. In some fields, authors on the by-line of a publication are ordered according to their contributions, where typically the first author has been a driving force in producing the research reported, while the last author has had a supervisory or overseeing role. In fields that follow this convention, it is typically expected that junior researchers develop their careers by getting more first-authorships, while senior researchers develop their careers by getting more last-authorships. Further, other kinds of research achievements are often included as well when assessing a scholar, such as, for example, the ability to attract research funding, or the amount of invitations to give talks.

However, critics have argued that different universities serve different goals and that a narrow focus on academic publications can be counterproductive for the role that a university serves locally or globally (Chou and Chan, 2017; Confraria and Godinho, 2015; Confraria et al., 2017, 2018, 2020; Mirnezami and Beaudry, 2021). Similarly, with the development of the mass university, it has been questioned whether it is adequate to focus exclusively research achievements when assessing the merits of university professors. For example, Ernest L. Boyer has argued in the report *Scholarship Reconsidered: Priorities of the Professoriate* (1990) published by the Carnegie Foundation for the Advancement of Teaching that the traditional focus on research is too narrow a conception of the role of professors. Instead, he found that the scholarship of the professoriate consists not only of cutting-edge inquiry, but also of the ability to place discoveries into a larger context, the ability to apply new knowledge, and the ability to transmit new knowledge to new generations. Similarly, the Career Framework for University Teaching, developed by Ruth Graham in collaboration with universities from around the world, has been “designed to guide and support the career progression of academics on the basis of their contribution to teaching and learning” (<https://teachingframework.com/>). This framework describes how decisions on promotion can be based on contributions that enhance excellence in teaching and learning within and beyond the assessed scholar’s institution, and that such contributions can be documented, for example, through professional activities such as leadership roles in policy development, or by design and delivery of high-impact educational material.

Sociological studies of the academic reward system

The link between publications and academic reward is an integral part of the modern research university. Up until the mid-20th century, the link was primarily described qualitatively, such as, for example, the account offered by dean Logan Wilson of Tulane University in his 1942 monograph *The Academic Man* that explored academic hierarchies, academic status and academic processes and functions at North American universities. Here, Wilson described both how the individual researchers’ possibilities for “horizontal or vertical mobility” is dependent on visibility and therefore by publications, and the precarious situation of the young instructors who needed to pay lip service to teaching while at the same time dealing with departments that emphasized quantity rather than quality in publication.

Quantitative studies of the academic reward system and of how stratification works in academia became popular during the 1960s and 1970s, after the emergence of the Science Citation Index made it possible to track citations. This commercial service made it possible to examine correlations between, for example, on the one hand scholars’ numbers of publications and citations, and on the other hand the positions and awards that they achieved. Such studies became an important part of the sociology of science that emerged with the work of scholars such as Robert Merton, Harriett Zuckermann, Jonathan Cole, Stephen Cole, Diana Crane, Warren Hagstrom, Daryl Chubin, and Derek de Solla Price.

Work from this era has produced several important qualifications to the “publish or perish” doctrine. First, studies of scholars from specific disciplines revealed that awards and prestigious positions were more strongly correlated with citation than with the number of publications (Cole and Cole, 1967, 1974). These studies indicated that it is not the act of publishing per se that is important for recognition, but rather the degree to which the produced publications influence other scholars. Second, these empirical studies also showed that while there is a certain correlation between citations and recognition, this correlation is not perfect. Admittedly, it is rare that a scientist with little impact receive significant rewards; yet, many scientists with high impact do not receive the same recognition as what has been bestowed to other peers with a similar impact (Merton, 1968). Third, the empirical studies also showed that reward is determined by many other factors than productivity and impact. For example, comparing scholars from within the US it was shown that scholars gain more recognition from their high productivity when they are employed on a major university rather than a less known university (Crane, 1965).

Studies of the correlation between publications, citations and reward have therefore also been used to point to structural inequalities in the scientific reward system. These studies were initiated with Merton’s work on the Matthew effect (Merton, 1968, 1988). Based on a combination of his own historical studies and the quantitative studies performed by a number of colleagues, most notably Zuckermann, Cole and Cole from his own research group, Merton argued that prominent scientists accrued greater increments of recognition for similar contributions than their less prominent peers and vice versa, and that this produced a cumulative advantage to the benefit of the more prominent scholars (Merton, 1968, 57). Later, historian of science Margaret Rossiter (1993) added new perspectives to this work, arguing that many women in the history of science had not received the recognition that they deserved. This phenomenon of systematic under-recognition of women’s achievements she named the Matilda

effect, after the nineteenth-century American sociologist of knowledge Matilda Joselyn Cane.¹ In recent years, there has been an increasing awareness of structural inequalities on a global scale (Nielsen and Andersen, 2021). For example, analyses of the academic impact of scholars from the Global South indicate that researchers who collaborate with partners from the Global North are more frequently cited than researchers without such collaborations (Confraria et al., 2017, 2018; Mirnezami and Beaudry, 2021).

The role of bibliometrics in research assessment

Over the last decades, it has become increasingly popular to draw on bibliometric indicators to assess the merits of individual scholars when they apply for positions or research grants. Multiple factors have contributed to this development. First, the companies that produce citation-tracking databases have advertised how their products can be used for producing objective evaluations (Garfield and Malin, 1968; Garfield, 1970). Second, the volume of research activity has increased immensely over the last century, and so has the number of scholars competing for positions and funding. In this situation, agencies and institutions that are faced with the time-consuming task of sorting between more and more applicants often see an interest in indicators that can establish a ranking between them more easily than through traditional review. Similarly, many academics are interested in keeping track of their position relative to their peers in the scholarly hierarchy, and bibliometric indicators that can be found in public databases can be seen as an easily tool for that purpose. Third, as public funding of research has increased, so has the demand for documenting what is gained from this expenditure. Further, institutions at all levels, from the individual departments over universities, to large foundations and governments agencies are increasingly interested in benchmarking. Hence, bibliometric indicators are increasingly being used not only to assess individual scholars, but also to compare between institutions or to document the return of investment in research (Godin, 2004).

With the increasing demand for bibliometrics, the number of bibliometric indicators have proliferated and so has the academic study of scientometrics. The literature is vast, and following section will focus only on those bibliometric indicators that are currently most popular for assessing individual scholars.

Productivity

The number of publications that a scholar has authored is often used as a measure of his or hers productivity. However, this is a very crude indicator, which obviously benefits senior scholars over junior scholars, simply because they have had more time available. If instead one wants to understand productivity as related to the efficiency in producing a given output, the number of publications need to be seen in relation to the time and resources that have been involved in producing these publications.

This suggests, first, that information about an author's number of publications should be supplemented with information about the time span during which they have been produced. Knowing both the number of publications that a scholar has authored, and the time span during which they have been authored makes it easier to compare scholars at different career stages. In principle, it makes it possible to take leaves of absence, parental duties etc. into account when assessing productivity. However, practices for whether or not to consider such aspects vary considerably between institutions and between countries and cultures. Similarly, it makes it possible to adjust for differences in working conditions, for example between research-intensive and teaching-intensive institutions, but this possibility is rarely pursued in practice.

Second, understanding productivity as efficiency also suggests that information about an author's number of publications should be supplemented with information about the amount of collaboration involved in the production of these publications. To compensate for the role of co-authors, the number of publications can, for example, be replaced with a basic fractional counting of authorship that only adds the number $1/m$ for a publication with m authors.² However, basic fractional counting of authorships assumes that all co-authors have shared the work equally among them, and this is only rarely the case. To compensate for that, it has been suggested instead to compute a weighted fractional output by weighing each author's basic fraction with a factor that depends on their order on the byline and on their institutional distribution (Abramo et al., 2013). Still, this depends on specific assumptions about the distribution of labor between, for example, first and last authors. In reality, a realistic assessment of the workload that a particular author has contributed to a given publication can only be assessed if the publication contains a contribution statement that offers detailed information about the contributions of each individual author. While more and more journals have started to require such detailed contribution statements, the categories used vary considerably from statement to statement, and there is currently no general procedure for transforming such statements into a quantified measure for the degree of authorship.

¹For an overview of recent empirical studies on this effect, see e.g., Larivière et al. (2013); for an estimate of the development over time and the prospect of a harmonization between the genders, see e.g., Bendels et al. (2018).

²Considerations such as these are included in the program Harzing's Publish or Perish (available from <https://harzing.com/resources/publish-or-perish>) that computes the average number of authors on a given scholar's publications as well as the normalized number of papers per author computed as the sum of the normalized author count for each of the papers that the author has co-authored (see also Harzing, 2010).

Impact

Productivity alone of course says little about the quality of the publications produced. Traditionally, the quality of research publications has been assessed by experts who have read them. However, as also mentioned above, as more and more scientists apply for positions and compete for research grants, it is becoming more and more time consuming to conduct such assessments. Many institutions and agencies therefore have a strong desire for quantitative indicators that can be used as a short cut instead of the time-consuming reviews.

Often, it is assumed that publications that provide important advances within their fields will also be widely read and cited, in other words, that research of a high quality will also have a high impact that can be traced through citations. Based on this assumption, the number of citations that a publication receives is seen as an indicator of its impact and quality.

Various databases exist that track citations. For example, the database Scopus, offered by the publishing company Elsevier, tracks how many citations are made to each publication in the database from other publications in the database and offers users information of the total number of citations, their development over time, and gives an assessment of how the citation count for a given publication compares to the average in the field. In addition, the service SciVal, also offered by Elsevier, uses the Scopus database to provide statistics of how large a share of a scholars publications that are among the top 10% and top 1% for citations within their field worldwide. Similarly, the database Web of Science, offered by Clarivate, also tracks citations between publications in the database. Google Scholar traces citations in scholarly literature more widely, including theses, abstracts, preprints and documents from academic online repositories and university web pages. For scholars who have created a personal Google Scholar profile, their personal profile page reports the aggregate number of citations. For scholars who do not have a personal Google Scholar profile, programs such as Harzing's Publish or Perish can be used to track their citation in Google Scholar as well as in a number of other databases.

Because these databases differ in which journals, languages, fields, and non-journal types of publications they cover, citation numbers for the same publication or the same author may vary from database to database. Further, citations depend on many factors, including local citation practices in the field, the number of other scholars working in the field, the language and the accessibility of the publication, etc. Citation numbers are therefore difficult to compare, especially across fields and across languages.

There is an extensive literature in scientometrics on how citations scores can be corrected for differences between fields; what it typically referred to as field-normalization. Field-normalizing citation scores requires a clear definition of scientific fields. Some field-normalization procedures draw on the field classification of journals provided by the databases Web of Science or Scopus, while others are based on how publications cluster together (Waltman and van Eck, 2019).

In addition, Leydesdorff and colleagues have argued that a distinction should be made between short-term citations that indicate the degree to which a publication is involved in current academic discourse, and long-term citations that indicate the degree to which a publication is incorporated into a generally accepted body of knowledge (Leydesdorff et al., 2016).

Aggregate indicators

In many decisions on academic reward, the aim is to honor those who are very efficient in producing publications of a high quality. It has therefore become popular to use aggregate indicators that combine productivity and impact. The currently most popular aggregate indicator is the so-called H index that was developed by the physicist Hirsch (2005). A scholar has an H index of n if he or she has produced n publications that have each been cited at least n times.

A crucial shortcoming of the H index is that it does not distinguish between, for example, a scholar who has published twenty papers that have each received little more than twenty citations, and a scholar who has published twenty papers that have each received hundreds or even thousands of citations. As argued by Gingras (2016), it is a typical shortcoming of aggregate indicators such of the H index that they fail to be sensitive to important variation in the phenomenon that they are supposed to measure.

Due to this shortcoming of the H index, a plethora of alternative indicators have been suggested to represent particular aspects of productivity and impact. Especially, the g and e indexes have been introduced to compensate for the problem that a scholar who has published ten papers with each ten citations has the same h index as a scholar who has published ten papers with each one hundred citations. For a scholar with an H index of n , the e -index is computed as the square root of the number of citations that exceeds n^2 (Zhang, 2009), while the g index is computed as the largest number such that the top g articles in a set of articles ranked in decreasing number of citations received (together) at least g^2 citations (Egghe, 2006). Comparing two scholars with similar numbers of publications and citations, where the one scholar has some publications that have received more citations than any of the publications authored by the other scholar, while the other scholar has fewer publications than the first that receive only few citations, the former will have higher e and g indexes, while the latter will have a higher h index. This is illustrated in Fig. 1, where the scholar with the higher peak has higher e and g indexes, while the scholar with the fatter tail will have a higher h index. There is no simple answer to the question which of the two scholars is "better." For example, a high peak may be due to the production of significant scientific advances, or it may be due to the production of widely applicable reviews of the research of others. Similarly, a fat tail may be due to a steady and solid research activity on a focused topic, or it may be due to participation in a "citation cartel" where a group of authors always cites each other's work. Only a close scrutiny of the actual publications can provide a more detailed assessment of the two compared to each other.

Fig. 1 Number of citations (y-axis) per paper for two different researchers with comparable number of publications and citations. The one with the higher peak has higher e and g indexes, while the one with the fatter tail has a higher h index.

Another point of criticism is that the H index is cumulative and therefore favors researchers who have been publishing over a long period of time. To adjust for academic age, the m quotions divides the H index by the number of years since the publication of the scholar's first publication, while the hIa-index adjusts for the duration of the career as well as for co-authorships by normalizing citations for each paper by dividing the number of citations by the number of authors for that paper, calculating the hI norm as the h-index from these normalized citation numbers, and then dividing by the number of years that the author has been active (Harzing, 2010). One the one hand, the m index and the hIa index in each their different ways adjust for the length of a scholar's career, but in doing so they also penalize authors who happened to have published their first paper particularly early in their career.

Commenting on the steadily increasing number of different bibliometric measures, Jappe et al. (2018) have argued that evaluative citation analyses does currently not form a traditional academic field with established standards of research competence and methodology, and where experts in the field exert reputational control of the field's development. Without an organized scientific community to give authoritative recommendations, no standard practices have developed.

Publication venues

Another popular proxy indicator for the quality of research publications is the publication venue. Assuming that particular journals primarily publish papers of a very high quality, publications published in these particular journals are expected to be of a high quality, while the same expectation does not hold for publications published in other journals. Many scholars therefore flag if their work is published in what they perceive as high quality publication venues.

There are different ways in which to identify high quality journals. Traditionally, it has been part of the shared knowledge in an academic field to know which journals were seen as central to the field, or in which journals it was considered especially hard to get a manuscript accepted. With the emergence of citation databases, this has been supplemented with quantitative indicators based on average citation rates. Web of Science computes a Journal Impact Factor (IF) for journals included in the database as the average number of citations that articles in a given journal receives over a two-year period. Similarly, the SCImago Lab uses data from Scopus to compute a SCImago Journal Rank (SJR) that deviates from the Web of Science' impact factor by using a 3-year citation window and by weighing citations according to the prestige of the journal from which they come.

However, the publication venue is a highly fallible indicator for the quality of individual publications. It is important to be aware that journal impact factors were originally developed to assist libraries with limited budgets to decide on subscriptions, not as an indicator of the quality of the individual papers (Garfield, 1972). For example, although it may be relatively rare that poor research is published in a highly competitive journal, high quality research can easily be published in a mediocre journal. Hence, despite information on the average impact of the journal in which a paper has been published, its quality can only be assessed by reading it, or as a proxy by assessing its impact by counting citations to the paper itself.

Metrics as a product

It is easy for scholars to keep track of their publications and to document their productivity through publication lists that specify the bibliographic information for each publication. In contrast, it can be much more difficult to get an overview of how often their publications have been cited. Citations can be made by many different people and in many different channels, hence, there is no easy way of knowing all citations to a particular publication or to a particular author.

Several companies therefore offer databases that track citations between academic publications. The first such service was the Scientific Citation Index that was created in the late 1950s and introduced as a commercial product in the mid 1960s. Originally, it covered only the natural and medical sciences. Later, the Arts and Humanities Index and the Social Science Index was added, and the indexes were merged into what is now called the Web of Science. To be included in the index, journals have to live up to a number of quality criteria and impact criteria. These include such issues as significance of the content, presence of policies for research ethics and for peer review, functionality of the website, and timeliness in production. Over the last decades, various alternatives to the Web of Science have emerged. The database Scopus produced by Elsevier is similar to the Web of Science in providing a broad coverage that includes not only the natural and health sciences but also the social sciences and humanities. Most other databases focus on particular academic areas, such as, for example, the biomedical database PubMed.

Different databases may differ substantially in their coverage of the literature. Such differences may include how far back the database collects information, the journals or publishers from which it collects information, or whether it includes books, conference series and other types of information. Therefore, the same author or the same publication may be listed in different databases with different citation counts. Some databases change their coverage over time, for example by adding new types of material or by extending its historical coverage further back in time. When additional material is added, citations will be added as well. Hence, as databases improve their coverage, scholars' citation numbers increase simply because more old citations are being counted.

While databases such as Web of Science or Scopus are curated and have detailed policies for which publications can be included and for the editorial processes through which it is decided, Google Scholar instead uses automated software to index publications found on websites, including academic repositories provided by universities and scholarly societies. In general, Google Scholar therefore covers much more literature than the curated databases, but it is also less transparent what is being covered. Citation counts drawn from Google Scholar therefore tend to be substantially higher than citation counts found in the curated databases. Although some studies indicate that citation analyses conducted on data from Web of Science, Scopus and Google Scholar provide equivalent results (Harzing and Alakangas, 2016; Martín-Martín et al., 2018), it is an issue of debate whether the excess citations in Google Scholar compared to Web of Science or Scopus should carry the same weight as the academic citations counted in the curated databases.

Recommendations for good practice

While the use of bibliometric indicators for the assessment of academics has become widespread, this use has also become subject of criticism, especially from scholars from scientometrics (Hicks et al., 2015; Stephan et al., 2017), statistics (Adler et al., 2009) and history and philosophy of science (Gingras, 2016).

To accommodate some of the points of criticism, some researchers have created guidelines for good practice in research evaluation. The Leiden Manifesto for Research Metrics (Hicks et al., 2015) lists the following ten principles for best practice in metrics-based research assessment³:

1. Quantitative evaluation should support qualitative, expert assessment
2. Measure performance against the research missions of the institution, group or researcher.
3. Protect excellence in locally relevant research.
4. Keep data collection and analytical processes open, transparent and simple.
5. Allow those evaluated to verify data and analysis.
6. Account for variation by field in publication and citation practices.
7. Base assessment of individual researchers on a qualitative judgment of their portfolio.
8. Avoid misplaced concreteness and false precision.
9. Recognize the systemic effects of assessment and indicators.
10. Scrutinize indicators regularly and update them.

Similarly, the San Francisco Declaration on Research Assessment (DORA; <https://sfdora.org>) presents a set of recommendations for agencies, institutions and researchers for how metrics should be used in research assessments. The initiative for these recommendations comes from a group of editors and publishers of scholarly journals, and an important focus of these recommendations is to eliminate the use of journal-based metrics such as journal impact factors when assessing researchers in relation to funding, appointment or promotion decisions. Thus, a central theme in these recommendations is the need to assess research on its own merits rather than based on the venue in which it has been published.

³A video version as well as translations into several languages can be found at <http://www.leidenmanifesto.org/>.

San Francisco Declaration on Research Assessment**General recommendation**

- Do not use journal-based metrics, such as Journal Impact Factors, as a surrogate measure of the quality of individual research articles, to assess an individual scientist's contributions, or in hiring, promotion, or funding decisions.

For funding agencies

- Be explicit about the criteria used in evaluating the scientific productivity of grant applicants and clearly highlight, especially for early-stage investigators, that the scientific content of a paper is much more important than publication metrics or the identity of the journal in which it was published.
- For the purposes of research assessment, consider the value and impact of all research outputs (including datasets and software) in addition to research publications, and consider a broad range of impact measures including qualitative indicators of research impact, such as influence on policy and practice.

For institutions

- Be explicit about the criteria used to reach hiring, tenure, and promotion decisions, clearly highlighting, especially for early-stage investigators, that the scientific content of a paper is much more important than publication metrics or the identity of the journal in which it was published.
- For the purposes of research assessment, consider the value and impact of all research outputs (including datasets and software) in addition to research publications, and consider a broad range of impact measures including qualitative indicators of research impact, such as influence on policy and practice.

For publishers

- Greatly reduce emphasis on the journal impact factor as a promotional tool, ideally by ceasing to promote the impact factor or by presenting the metric in the context of a variety of journal-based metrics (e.g., 5-year impact factor, EigenFactor [8], SCImago [9], h-index, editorial and publication times, etc.) that provide a richer view of journal performance.
- Make available a range of article-level metrics to encourage a shift toward assessment based on the scientific content of an article rather than publication metrics of the journal in which it was published.
- Encourage responsible authorship practices and the provision of information about the specific contributions of each author.
- Whether a journal is open-access or subscription-based, remove all reuse limitations on reference lists in research articles and make them available under the Creative Commons Public Domain Dedication [10].
- Remove or reduce the constraints on the number of references in research articles, and, where appropriate, mandate the citation of primary literature in favor of reviews in order to give credit to the group(s) who first reported a finding.

For organizations that supply metrics

- Be open and transparent by providing data and methods used to calculate all metrics.
- Provide the data under a license that allows unrestricted reuse, and provide computational access to data, where possible.
- Be clear that inappropriate manipulation of metrics will not be tolerated; be explicit about what constitutes inappropriate manipulation and what measures will be taken to combat this.
- Account for the variation in article types (e.g., reviews vs. research articles), and in different subject areas when metrics are used, aggregated, or compared.

For researchers

- When involved in committees making decisions about funding, hiring, tenure, or promotion, make assessments based on scientific content rather than publication metrics.
- Wherever appropriate, cite primary literature in which observations are first reported rather than reviews in order to give credit where credit is due.
- Use a range of article metrics and indicators on personal/supporting statements, as evidence of the impact of individual published articles and other research outputs.
- Challenge research assessment practices that rely inappropriately on Journal Impact Factors and promote and teach best practice that focuses on the value and influence of specific research outputs.

Finally, the Research Quality Plus Assessment Framework (RQ+) developed by Canada's International Development Research Center (IDRC) aims at evaluating the quality of translational research, especially research that is grounded in and applied to local experience (Lebel and McLean, 2018). This framework assists evaluators, managers and funders in identifying constraining factors of a research projects related to:

1. Maturity of the research field
2. Research capacity strengthening
3. Risk in the data environment
4. Risk in the research environment
5. Risk in the political environment

As well as dimensions of research quality related to.

1. Research integrity

2. Research legitimacy
3. Research importance
4. Positioning for use

RQ+ provides an evaluative rubric with a language for describing key influencing factors and for specifying criteria for judging quality. Hence, the framework is aimed at including “important aspects of the context in which the research has been conducted, and the manner in which it has been managed” (Ofir et al., 2016, 12).

Adverse effects of a quantified view on “publish or perish”

Strong incentive structures often have adverse effects. The “publish or perish” doctrine’s strong emphasis on the need to publish or the need to be visible have several adverse effects.

First, scholars may boost their publication lists by publishing the same result several times. If the redundancy is openly declared, it can be fully legitimate, for example if the parallel publications serves to communicate to a different audience than the original publication. However, if the redundancy is concealed, the duplicate publication is seen as questionable research practice. Similarly, scholars may boost their publication list by slicing a given result into as many “salami” publications as possible, instead of publishing it all at once.

Second, scholars may boost their publication list by becoming co-authors on paper where they do not really deserve it. Sometimes, co-authors are included on the byline of a paper although their contribution to the publication has been only marginal. This is usually referred to as “gift authorships.” There can be many reasons why scholars grant such gift authorships to a co-author. Sometimes, it is difficult to draw the line of whom to include on the byline and gift authorships may be granted out of courtesy. Sometimes, they are granted to prominent scholars in the field in order to increase the visibility of a paper. Sometimes, they are demanded by senior scholars of power, and they are then referred to as coercive authorship. In all of the mentioned cases, a gift authorship confers credit to people who have not earned this credit, and it gives the reader a wrong impression of who bears responsibility for the research reported in the paper. It is therefore considered questionable research practice to accept as well as to grant gift authorships.

To promote good authorship practices, the International Committee of Medical Journal Editors has issued a set of guidelines for authorship that gradually become accepted by more and more journals across a broad range of fields. These guidelines, often referred to as the Vancouver guidelines, stipulate that authors to a publication should fulfill the following four criteria:

- Substantial contributions to the conception or design of the work; or the acquisition, analysis, or interpretation of data for the work; AND
- Drafting the work or revising it critically for important intellectual content; AND
- Final approval of the version to be published; AND
- Agreement to be accountable for all aspects of the work in ensuring that questions related to the accuracy or integrity of any part of the work are appropriately investigated and resolved.

However, although the guidelines are widely adopted, empirical studies indicate that many authorship are still granted for minor activities that should instead have been accredited in the acknowledgments (Patience et al., 2019; Macfarlane, 2017; Martinson et al., 2005).

The strong emphasis on bibliometric indicators such as the H index can also lead to adverse effects. For example, due to the strong emphasis on high impact, scholars may boost their citation counts by forming citation cartels whose members continuously cite each other. Similarly, referees may in their reviews request citations of their own work, or editors may in their decision letters request citations of papers in their journal. The same holds for indicators at aggregate levels. For example, editors may boost their journal’s impact factor by carefully distributing articles across the year in such a way that papers for which the editor expects many citations are published at the beginning of the year and therefore stays for a longer time in the citation window that is used to compute the impact factor, while papers that are expected to receive only few citations are published at the end of the year.

Finally, it has also been argued that the overall publication pressure in academia makes some researchers cut corners and rush their findings and that this has contributed to the ongoing reproducibility crisis (Baker, 2016; Grimes et al., 2018; Ioannidis, 2005; Young et al., 2008).

Hence, as argued by Elton (2004), examples such as these vindicate Goodhart’s Law that says that an indicator typically ceases to be a good indicator when it becomes a target in itself. This is because indicators only serve as partial proxies for actual performance. Hence, when indicators are used for control, they change behavior to optimize what is being measured and neglect that is not being measured.

Introduction

In recent higher education policy debates, internationalization tends to be a relatively unquestioned policy phenomenon that is described by a seemingly straight-forward adding of an “international, intercultural or global dimension into the purpose, functions or delivery of postsecondary education” (Knight, 2003). Building on this definition by Jane Knight, de Wit & Hunter (2015, p.3) tied internationalization to a societal purpose and defined it as “the *intentional* process of integrating an international, intercultural or global dimension into the purpose, functions and delivery of post-secondary education, *in order to enhance the quality of education and research for all students and staff, and to make a meaningful contribution to society* [emphasis in the original]”. Ultimately, both definitions fail to acknowledge the ideological nature of internationalization and the layers of historical, societal, and cultural power structures embedded in it (see for instance Brooks and Waters 2011). As pointed out by Jokila (2020), despite the recent increase in activities that are tagged as “international” and the political measures undergirding those activities, internationalization is still depicted as a neutral concept, policy, and activity.

Internationalization of higher education and (student) mobility tend to be used interchangeably (Knight, 2012), as internationalization policies have often been operationalized as mobility and co-operation programs. Newer debates on internationalization and mobility have, however, demonstrated the unsuitability of homogeneous typologizations of separate categories of student mobility, labor market mobility, family based mobility, refugee status mobility etc., as these do not take into account the varied and hybrid roles and identities that mobile individuals and groups have over time (see for instance Robertson, 2013, for a discussion of the complexity of the student - migrant categories). Consequently, the shortcomings of current conceptualizations of the role of language in internationalization relate to un(der)addressed issues in internationalization debates that this article hopes to bring to the fore.

Ideologies of internationalization

Motivations for internationalization have shifted since the Second World War as internationalization gradually started to become a systematic part of the activities of higher education institutions. Post- World War II internationalization has been described as “benevolent laissez-faire” (Baron, 1993; cited by de Wit and Merckx, 2012), implying benevolence and unregulated mobility for those with access and resources to be mobile. In the post-war period, internationalization had strong peacekeeping undertones particularly in Europe that was recovering not just from a devastating war but also from genocides and unprecedented refugee numbers (see also de Wit, 2020).

Toward the 1960s, the ideologies behind internationalization became more complex. Post-war humanitarian idealism increasingly gave way to polarized ideologies and an explicit politicization of internationalization during the Cold War (Altbach and de Wit, 2015). In addition, students from recently independent countries such as India or several West-African countries began to increasingly enter higher education, often in the countries of their former colonizing powers. (Ploner and Nada, 2020). A further factor influencing post-war internationalizations was the active US cultural foreign policy as a part of the post-war “Pax Americana”, or post-World War US policies aimed at solidifying its dominant position, resting on US economic and military dominance as well as the ideological appeal of the US and the international institutions built by it since 1945 (Layne, 2012). This policy emerged particularly in Western Europe and Eastern Asia in the form of exchange programs such as Fulbright (see for instance Haberland, 2009). As a result, English started to take over as a language of internationalization.

During the 1970s and 1980s, economic motivations began to drive the systematic development of higher education internationalization, particularly in Europe but also elsewhere (de Wit and Merckx, 2012), strengthening the understanding of higher education as an economic commodity (de Wit 2020). Demands for public accountability and external evaluation since the global economic depression of the 1970s and the ensuing cuts in public funding, coupled with policies that aimed to ensure HE “quality” and “comparability”, set the tone also for internationalization policies. Internationalization became a more systematic activity, and was largely motivated by educational and labor market mobilities particularly in European integration (see for instance de Wit and Hunter, 2015; Teichler, 2004). This development further emphasized the position of English as the language of the post-nationalist global economy (Pujolar, 2017).

The global political turn in the 2000s toward new nationalism and populism, combined with protectionist agendas of creating barriers to international (student) mobility also changed the ways in which “internationalization of higher education” is understood and enacted. One example of this are the emerging concerns for the national languages that are presented as being threatened by increasing use of English (see Saarinen, 2020; Soler, 2019). As national authorities have started criticizing the extensive use of English, its use has been anticipated to be “reaching a ceiling” in at least European higher education, (Altbach and de Wit, 2018). Another example is presented by Mathies and Weimer (2018) who discuss the hierarchization of international students in new nationalism. Discussing Chouhada et al. (2012) taxonomy (cited by Mathies and Weimer 2018, 149–150), they discuss the role of neo-racism (i.e. racism based on a proxy such as language or nationality; Lee and Rice, 2007; Lee et al., 2016) in international student mobility. The dimensions of international students’ academic credentials of preparation (high/low) and the financial resources at their disposal (high/low) can be used to categorize students into four types. Traditionally, the thinking has been that the “high flyers” in the high academic preparation/high financial resources category have not faced much difficulty in international mobility. However, adding a third dimension of high/low desirability based on origin makes visible the racialized nature of international student categorizations. (New) nationalist factors (leading to racist categorizations and policies) impact international student mobility more than higher education research and policy making have previously recognized.

In addition to the macro trends in internationalization, depicted above, also more short-term developments impact internationalization trends globally and regionally. Ecological and health factors (natural disasters, pandemics, etc.), cultural factors (for instance developments in “cultural foreign policy” such as the US Fulbright or Chinese Confucius Institute schemes), demographics, and academic rationales (which are by no means detached from the others) all have their influence on internationalization policies (de Wit and Altbach, 2021). These various, historically and politically layered motivations of internationalization emphasize the need to unpack the seemingly benevolent or neutral purposes of internationalization and ask, whose benefit we are ultimately talking about.

An example of the complexity of benefits of mobilities is the concept of “internationalization at home” that has been coined to refer to international interaction in one’s own environment (Nilsson, 2000). The concept of internationalization at home aims at offering an international learning experience to a wider group of students who remain at their home campuses by internationalizing the curriculum in different ways. As the expectation is that at least a part of internalization at home requires interaction with incoming staff and students, it still hinges on someone else’s mobility, thus raising important questions not only about “who is able to be mobile?” but also “who has to be mobile?”

As mentioned above, the term “international” assumes “national” units, and is hierarchical in nature, as made evident by the discourses of migrant versus expatriate or mobility versus migration (see Kunz, 2016, for a review of privileged categories of migration). Internationalization is, thus, conceptually linked with the nation state and its interests, and carries recycled discourses and the ensuing baggage of “nation” with it (Saarinen, 2020). This national(ist) nature of international is also reflected in unproblematised monolingual assumptions about mobility and internationalization, as we invariably discuss “foreign” students participating in “international” mobility in a “host” country in a particular language, thus homogenizing internationalization.

The current policies and practices of internationalization as a part of global higher education trends are the result of a variety of entangled processes that mix neoliberal ideologies and new nationalist protectionism with (allegedly) humanitarian values of cosmopolitanism, multiculturalism, and diversity. The normative and normalizing assumptions of internationalization as a humanitarian activity have been entangled with the values of competition and market dynamics of higher education. This, in turn, normalizes the meritocratic view of internationalization as individual and systemic competition, deflecting our view from the inequities embedded in the system (Bamberger et al., 2019, p. 211–212.).

Language and internationalization: the case of English

In internationalization of higher education, language may appear as a non-issue, as English tends to be taken for granted in many contexts (Jenkins and Mauranen, 2019). This *internationalist* view is often linked with discourses of national competition in international markets, as nation states develop systematic internationalization of their higher education systems to promote their international competitiveness (Hultgren et al., 2014; Saarinen, 2020). The *culturalist* view, in turn, focusses on safeguarding the national culture and national language, often from alleged threats brought on by global cooperation and specifically the use of English (Hultgren et al., 2014; Phillipson, 2015; Salö, 2014). Interestingly, the culturalist discourses are produced either from right wing (populist new nationalism) or left wing (critique of globalist threats to welfare state) approaches (see Salö, 2014).

As language is a gatekeeper for international students, who are often required to take standardized language tests to demonstrate adequate language skills, it is important to examine the ostensibly neutral or unaddressed ways language and language skills occupy

in internationalization contexts. For example, the ideological nature of language in internationalization context surfaces in different English language requirements that are based on political rather than linguistic criteria (e.g., Whose English is considered adequate? - see [Saarinen and Nikula, 2013](#)) or in the motivations for so-called accent reduction or accent modification courses offered to international students (and clearly geared at particular populations) in the United States ([Enns-Kananen et al., 2021](#)).

In this section, we will focus on the role of English in internationalization of higher education, while recognizing that neither English nor the linguistic landscape of higher education are homogeneous.

The multilayered dominance of English and anglophone contexts

English appears as an unproblematised language in internationalization on at least three levels.

First, economically developed English-dominant countries such as the USA, the UK, Australia, Canada, and New Zealand have long been core destinations for foreign students pursuing higher education abroad ([Barnett et al., 2016](#); [Gümüş et al., 2020](#)). A vast majority of students from China, the largest group of mobile students, choose an English speaking country for their international studies ([Barnett et al., 2016](#)). Mobility to tuition/fee-charging countries is also an economic issue: International students are a major source of revenue in for instance Australia and other Anglophone countries, and are subject to tuition in some systems, even if locals are not ([Cantwell, 2015](#)). Also in Nordic countries, where study fees are a relatively new phenomenon, the discourse of commodification of higher education has accompanied the introduction of study fees for international students ([Saarinen 2020](#)).

Receiving hubs of international students are also emerging in non-Anglophone Eastern Asian and European contexts, where either English Medium Instruction (EMI) is set up to attract international students, or where languages other than English are used for purposes of mobility ([Chen and Barnett, 2000](#); [Barnett et al., 2016](#); [Galloway et al., 2020](#)). In contrast, in terms of numbers of received students, African and West Asian countries remain minor destinations in internationalization networks. As [Chen and Barnett \(2000, 435\)](#), have pointed out, this suggests that hegemonies of internationalization are run along the same lines as global economic and political hegemonies. In all these contexts, language plays an important role in creating networks and directing student flows to major receivers for instance from countries who are political allies or former colonies ([Barnett et al., 2016](#)).

Second, research on international student mobility seems to center around Anglophone researchers and contexts ([Gümüş et al., 2020](#)), which creates a conceptual bias. This, combined with the dominant status that countries such as the UK, US, Australia, and (Anglophone) Canada hold in the field of international mobility ([Barnett et al., 2016](#)) normalizes the hegemonic position of Anglophone countries in internationalization processes. In other words, both the activity of internationalization and the research on it are largely rooted in so-called “western” and specifically Anglophone contexts (see [de Wit and Hunter, 2015](#); [Jokila, 2020](#); [Teichler, 2004](#)).

Third, and related to the previous point, also research metrics and databases such as Web of Science that are used to study the conceptual basis of internationalization are biased toward English language research ([Gümüş et al., 2020](#); [Kuzhabekova et al., 2015](#)). In other words, internationalization research is likely overlooking studies on internationalization and mobility that are published in other languages than English and/or empirically conducted in non-English dominant areas. In short, the Anglophone bias of our view likely distorts our view both empirically and conceptually.

English in non-anglophone contexts

As mentioned above, in the higher education context of many non-Anglophone-dominant countries, English Medium Instruction (EMI) programs have been created with the goal of attracting international students. For instance in Europe and Eastern Asia, universities have been politically encouraged to promote policies of internationalization, and have consequently added EMI programs to their curricula ([Galloway et al., 2020](#)).

English medium instruction (EMI) is driven by a variety of motivations in non-Anglophone higher education contexts (see articles in [Dimova et al., 2015](#)). For instance, EMI may be offered in order to attract international students for so-called “brain gain”, defined as the problematic notion of importing in-demand knowledge and skills. This policy relates to the ongoing emphasis in higher education on public accountability and so-called “higher education excellence” (see section on ideologies of internationalization above).

Another motivation for offering EMI is to offer international experiences for local students (*internationalization at home*; see section on ideologies of internationalization above) and, relatedly, help prevent “brain drain” by helping keep local students in their home countries and institutions ([Soler, 2019](#)).

A third motivation, particularly in contexts where student cohorts are waning, is to compensate for a decrease in local student numbers with an increase in international (possibly fee-paying) ones, as is for instance the case in Estonia ([Soler, 2019](#)) and Latvia ([Kibbermann, 2017](#)). In the context of European integration, an increase in EMI programs has gone hand in hand with tuition waivers for EU students but introducing or increasing tuition for others, which creates inequities among different groups of international students.

In the contexts where English has been introduced as language of internationalization, it has sparked a variety of discourses, ranging from benevolent “language of internationalization” to English as “killer language” that poses a threat to other academic languages ([Bull, 2012](#)). This reflects on the societal, political, and cultural role of English as far more than “just a language that can be taught” (see [Pennycook, 2017](#) for an extensive discussion). Although the *internationalist* and *culturalist* (see section on

language and Internationalization above) discourses of internationalization tend to revolve around the role of English and its relationship with the local language(s), it is important to note that such discussions about the role of English in internationalization cannot be reduced to the debate of local languages versus English alone (see Salö, 2014, on the Swedish situation or Saarinen 2020 on the Finnish one), as many socio-political, historical, and linguistic factors shape them.

Although we cannot disentangle the discourses of English in internationalization of higher education in depth in this chapter, we contend that in order for this discussion to be fruitful and productive, both internationalization and English need to shed their cloaks of innocence, educational quality, or global benevolence (Bruthiaux, 2003). Instead, we have to recognize the power dynamics, especially in the shape of nationalism, neoliberalism, and Empire (see below), that are intertwined in these processes.

English, internationalization and Empire

While the unique and ambivalent status of English (or rather, Englishes) in our societies has to be recognized (Canagarajah, 1999; Saarinen and Ennser-Kananen, 2020), it is important to critically examine the equation of English with “international” and the celebration of English as a worldwide lingua franca, beginning with the recognition that the global spread of English is not a coincidence but rather the outcome of a colonial project. Important work in this area has begun to gain traction in TESOL (Teaching English to speakers of other languages), which is closely related and partly overlaps with EMI contexts. Motha (2014) has examined the ongoing involvement of the field of TESOL in processes of coloniality through a lens of what she calls Empire.

Although scholars from all disciplines readily acknowledge colonialism as a historical fact, its ongoing processes and its intertwinedness with English in educational contexts are far from consensual. In her description of colonialism, Motha (2014) stresses that, “(t)he insertion of English into the mouths and hearts of the (colonized) population was often an inherent part of the project”, with the consequence that in the field of TESOL, “a colonial imprint is stamped into our profession and remains there indelibly even in a modern-day context in which English is presented as intensely desirable through global media and the English-teaching industry.” (p. 27). To speak about this continued form of colonialism, Motha draws on Negri and Hardt (2000) in her use of *Empire* (with capital E) to denote a contemporary form of colonial activity, which is strongly intertwined with neoliberalism and may be a “less willfully intentional” (p. 31) and thus less recognizable force than historical colonialism. Importantly, Empire works through “constructing the desirability of ‘Western-ness’ and English and (keeps) legitimate ownership of English associated with Whiteness and ‘Western’ identity” (p. 31). It is through this lens we suggest looking at the intersection of internationalization and English.

Many others have pointed to Empire in the context of language and particularly English education. For instance, in his 1998 book *English and the Discourses of Colonialism*, Pennycook (1998) shows how colonial discourses are by no means restricted to the historical contexts of their origins but rather very much ongoing processes that form the foundation of so-called “Western” thinking and being. For instance, in an effort to reject notions of English as neutral global lingua franca (see the next section on English as Lingua Franca), he draws comparisons between colonial and modern descriptions of English as a superior language, showing and refuting discourses of supremacy (e.g. linguistic purity, richness, openness, and versatility) of both the language and, by extension, its speakers. For today’s professionals and students in English learning/teaching contexts, it is important to understand that such discourses are not based on linguistic realities but rather an (not always intentional) enactment of Empire that justifies itself by constructing an ideology of superiority of some languages and varieties and its speakers over others. Resisting English altogether is not always a feasible or beneficial solution (Pennycook, 1998), but the promotion and establishment of counter discourses to Empire is one productive avenue to pursue.

In all, a large amount of research (Hsu, 2017) has explicated the entrenchedness of Empire and global capitalism in the learning and teaching of English, and how these dynamics are still ongoing and palpable in today (Canagarajah, 1999; Kachru, 1992). To engage in the topic of English and internationalization in a meaningful way, we therefore suggest that rather than taking English for granted as *the* international language, it is more helpful to understand this equation as a discourse. As Kubota (2012) puts it,

The idea that English is an international language can be viewed as a discourse rather than an absolute fact, shaping people’s consciousness, social practice and institutional policies, including the current heavy focus on teaching English worldwide.

(Kubota, 2012, p. 55).

This discourse can then be examined for its ideological underpinnings and implications, including the participation of “English as the international language” in processes of coloniality and discrimination.

English for the (first) world? The pitfalls of ELF (and other) approaches

Several noteworthy attempts have been undertaken to recognize the unique position of English globally while overcoming its tendency to hierarchize speakers by variety, accent, or proximity to so-called “nativeness”. In the newer edition of his book (2017), Pennycook criticizes conceptualizations of English as “international language”, in particular English as a lingua franca (ELF), which conceptualizes English among so-called non-native speakers as a variety in its own right (Seidlhofer, 2005), World Englishes, which recognizes varieties of English in many countries worldwide, and theories of linguistic imperialism. In particular, he takes issue with the failure of ELF and World English approaches “to address power and inequality in any adequate way” and

with the inability of linguistic imperialism approaches “to construct a plausible model of language” (p. viii). In the same vein, Kubota’s (2012) critique of (allegedly) anti-normative approaches to English as an international language underlines the failure of World English approaches to shed their nation-statist paradigm and cultural essentialism; the risk of ELF to perpetuate the marginalization and homogenization of non-native speakers; the insensitivity of linguistic imperialism toward social identities; and the shortcomings of approaches that promote the hybridity and fluidity of identities while ignoring that stability and fluidity coexist and are shaped by dominant power dynamics.

English as a lingua franca (ELF) has been recognized for its intention to shed native-speakerism and uplift those who learn English as an additional language. However, ELF as variety of English and related pedagogies have also been met with strong criticism. For instance, Park and Wee (2011) have called for a more power-sensitive approach, explaining that

simply creating an egalitarian market where everyone has equal access to valued resources or claims of legitimacy is not possible; and for this reason, endeavors such as the ELF project need to be greatly more sensitive to the political consequences of formulating and promoting such alternative markets (Park and Wee, 2011, p. 366).

Additionally, O’Regan’s “immanent critique” (2014, p. 533) of the ELF concept points to inconsistencies in its theorization and critiques its reliance on neoliberal ideologies that undergird a naive approach to globalization, which “has brought about fluidity and hybridity in language and where in global communication flows everybody is accommodating to everybody else in a playful postmodern manner” (O’Regan, 2014, p. 543). Although this critique has been responded to thoroughly (Baker et al., 2015) and although, as Baker et al. (2015) point out, issues of power have been in the focus of several ELF scholars, the authors do not speak to the ability or willingness of ELF approaches to acknowledge injustices that are rooted in sociohistorical processes linked to coloniality. For instance, the native-non-native speaker divide that still plagues much of language education and interaction also in HE contexts is a problem against which ELF has been called into existence. A proclamation of equity among all English users can only be substantiated if the roots of the “native speaker” ideal in colonial processes and thinking (Pennycook, 1998) are acknowledged, and language scholars actively participate in dismantling such ongoing processes. Particularly in combination with the problematic concept of “internationalization”, in connection to which English is often uncritically positioned as “international language”, an uncovering of the socio-historical and socio-political power dynamics and their entanglement with Empire are paramount.

Conclusion: ways forward

We started by pointing out that Knight’s (2003) and de Wit and Hunter’s (2015) definition of internationalization fail to take into account systemic inequities in higher education. We conclude by offering some suggestions for addressing these inequities in relation to language and internationalization efforts. In our suggestions, we keep in mind – or maybe naively assume – that equitable, societally beneficial, and high quality education for all remains the goal of higher education and thereby internationalization. We thus come back to de Wit and Hunter (2015) and their proclaimed goal of internationalization to “*enhance the quality of education and research for all students and staff, and to make a meaningful contribution to society*” (p. 3), and argue that ideas and initiatives exist that are better equipped to move higher education toward these goals than internationalization in its current form.

Ethnic studies, one promising attempt of centering student populations that have historically been in the margins of education (Banks, 2012; Sleeter, 2011), has proven to be an effective way not only to center those students and their experiences, but also to increase attendance as well as educational achievement (Dee and Penner, 2017). Centering the histories, experiences, and identities of minoritized (and often racialized and colonized) populations is not merely an initiative for those groups. Such programs offer the development of crucial life skills, including those promoted by internationalization, also to members of dominant groups, including the opportunity to develop socio-historical awareness, anti-oppressive consciousness and activism, and a critical, reflexive stance toward themselves, their communities, and society at large. The goals that have (allegedly) been those of internationalization could be pursued via ethnic studies.

Second, research from TESOL contexts (Hsu, 2017) that is applicable to higher education studies helps identify strategies for challenging the perpetuation of the coloniality of English, starting with a theoretical reconceptualization of the field, which includes a pushing back against discourses of English as neutral language and its color-evasiveness. We suggest that such self-reflexive practice also centers and critiques racialization discourses and raciolinguistic ideologies (Flores and Rosa, 2015) that have sustained and normalized colonial practices in the academy. In addition, we amplify Hsu’s call for critically employing methods and curriculum with the goal of building on local and communal knowledges, including translanguaging (García and Wei, 2014), and legitimize learners from all backgrounds as rightful knowers and multilingual speakers. Specifically, there is a need in TESOL as well as higher education research to address the colonial legacy of the fields and build on this historical awareness to develop and practice anti-normative, anti-colonial pedagogies and practices.

Concrete ideas exist to work toward such pedagogies and practices, for example by Kubota (2012). Her concept of “border-crossing communication” (p. 63) aims to promote students’ sensitivity toward questions of power and privilege and fosters equitable encounters across different languages and contexts. Similarly, we find Motha’s (2014) call for provincialized English

useful, which forefronts the effects of Empire on learning and education. In her words, “(t)o provincialize English would mean that inherent in the learning of English would be an intense awareness of the effects on English’s colonial and racial history on current-day language, economic, political, and social practices”. She continues by explaining that such an approach “would furthermore examine and critique the mechanisms that sustain the invisibility of race and empire in English language teaching and would explore possibilities for transformation and agency” (p. 129). Applied to higher education studies, such an approach could transform the areas and processes that are currently known as internationalization.

In the end, we come back to the purpose of internationalization. As a concept that gained traction in the 19th Century industrializing, modernizing, Western emerging nation states (see Holmila and Ihalainen, 2022), we argue that internationalization in its current form as a normative, ostensibly neutral and ultimately nation state-centered activity has reached its expiration date. In order to challenge inequities, internationalization cannot be treated as an isolated policy activity in higher education but instead needs to be embedded in a larger process of improving higher education for all.

Formulating a consistent definition for academic freedom, even from within the perspective of a single nation or academic tradition, presents a difficult task. Despite challenges in delineating a singular academic freedom definition, the issue of providing scholars with sufficient intellectual independence to carry out their professional duties in the realms of research, teaching, and service to their students, colleagues, and institutions and to society more broadly has been identified as a salient concern for colleges and universities throughout the world (e.g., Kinzelbach et al., 2021; Altbach, 2013). For example, academic freedom has been identified as a necessary ingredient for the building of high quality higher education institutions, with a “high degree of academic freedom ... particularly important for the social sciences and humanities, but all fields benefit [ing] from freedom of inquiry and a sense that the university is committed to the free expression of ideas” (Altbach, 2013, p. 137). The Scholars at Risk Network and Global Public Policy Institute have described academic freedom as encompassing a “universal right and essential to quality education, teaching and research. It is a driver of innovation, enhances the capacity of scholars and students to acquire and generate knowledge, and thereby protects societies’ capacity for self-reflection” (Kinzelbach et al., 2021, p. 4).

A 2020 United Nations report by David Kaye while serving as the U.N. Special Rapporteur for Freedom of Opinion and Expression espoused the importance of academic freedom as helping to maintain “democratic life,” “scientific progress,” and “human development” (Kaye, 2020, p. 4). Kaye’s report looked to language from the 1997 United Nations Educational, Scientific and Cultural Organization (UNESCO) Recommendation Concerning the Status of Higher Education Teaching Personnel as to the contours of academic freedom:

Members of the academic community, individually or collectively, are free to pursue, develop and transmit knowledge and ideas, through research, teaching, study, discussion, documentation, production, creation or writing. Academic freedom includes the liberty of individuals to express freely opinions about the institution or system in which they work, to fulfil their functions without discrimination or fear of repression by the State or any other actor, to participate in professional or representative academic bodies, and to enjoy all the internationally recognized human rights applicable to other individuals in the same jurisdiction.

Quinn and Levine (2014) offer a similar assessment of the role of academic freedom and independent higher education institutions, including as a space for the exercise of democratic values, stating:

At their best, higher education communities are models and teachers of democratic values. They model and pass into society the skills and knowledge necessary for democratic value systems to function properly, most notably a democratic “knowledge-over-force” principle that rejects violence and force as determinants of outcomes, in favour of process, evidence, reasoned discourse and quality (p. 214).

They also note that higher education institutions do not operate in a values vacuum and that institutions and members of academic communities, including as citizens in general, must be able to exist in overall political and social environments that are conducive to supporting and maintaining academic freedom.

Beiter et al. (2016) describe how academic freedom provides an avenue to support the advancement of knowledge and what they describe as the “discovery of truth” (p. 128). Furthermore, the authors point out the distinctive role of universities in advancing knowledge, an outcome that requires sufficient individual academic freedom and institutional autonomy. At the individual level, the authors note the role of higher education personnel in promoting “intellectual independence” in support of “ethical individualism” (Beiter et al., 2016, p. 111). For the concept of ethical individualism, they look to Ronald Dworkin, whose work dealt with the idea of individuals having the freedom to follow personal conviction in determining the ingredients

and purposes of a successful life (Beiter et al., 2016, p. 130). For the authors, the “ultimate” rationale to safeguard academic freedom emanates from the key role of higher education institutions and personnel in supporting and advancing human dignity (Beiter et al., 2016, p. 132).

This entry reviews the concept of academic freedom as a human right, with special attention paid to international agreements and proclamations, such as through the United Nations. Coverage is also given to academic freedom in the United States and the use of tenure as an employment arrangement intended to safeguard faculty academic freedom (Sun and Hutchens, 2019). The development of US research universities provides a useful example of institutions where academic freedom came to be viewed as a core value of academic life and institutional functioning (see, e.g., Marginson, 2014; Altbach, 2013). However, as covered in the section, rhetoric from academic leaders or language in institutional mission statements do not always match with reality. The entry also examines current challenges to academic freedom around the globe.

Contemporary roots of academic freedom

Simon Marginson (2014) argues that the development of “academic freedom is best understood not as an abstract universal principle or an ideal state of being but as concrete university practices nested in specific relational environments” (p. 24). The institutional practices that underpin academic freedom are institutional autonomy and the professionalization of the professoriate, which trace back in nascent forms to Islamic madrasas and palace schools in the Ottoman empire (Kreckel, 2017). Sociologist David Baker argues that medieval universities in Western Europe developed institutional autonomy by positioning themselves between the Church and state. External institutions sought “to instrumentalize the university,” but “in struggles with first the Church, then European absolutist rulers, then the modern nation-state, and perhaps lastly with large-scale capitalism, the basic model of universal inquiry has become institutionally stronger within the university” (Baker, 2014, p. 70). As medieval universities escaped ideological capture by religious authorities, monarchs, and governments, they cultivated legitimacy for themselves and their operators.

Beiter et al. (2016) trace the development of academic freedom in contemporary higher education settings to developments in the Enlightenment that found special expression in Prussia, including the importance of the ideas of “freedom of teaching (*Lehrfreiheit*), freedom of learning (*Lernfreiheit*), [and] the unity of teaching and research (*Einheit von Lehre und Forschung*) (in terms of which both students and professors are involved in a joint endeavor of discovering the truth)” (p. 114) (see also, e.g., Altbach, 2013; Sun and Hutchens, 2019). Practices and ideas around academic freedom in Prussia and then a unified German state would influence developments in other European countries, with Beiter et al. (2016) noting that the concept of “freedom of science” would especially gain traction in other European nations. While related to academic freedom, the authors describe freedom of science as distinct from the more encompassing term of academic freedom. The authors point to the United Kingdom and the United States as the places where the contemporary “concept” of academic freedom most originated and developed. In relation to the United Kingdom, they observe that UK law, except in a few instances, is “essentially silent” on academic freedom. According to Beiter et al. (2016), “To a large extent, the protection of academic freedom and institutional autonomy in the UK has been and remains a matter of convention and practice” (p. 117). For the United States, as taken up in the next section, efforts to protect academic freedom developed along two main tracks—(1) reliance on professionalism standards and on tenure as a means to secure economic security for professors and (2) legal protections for academic freedom derived from the First Amendment of the US Constitution.

US universities and academic freedom—tenure and constitutional protections

The establishment of the research university in the United States played a notable role in the development of contemporary concepts of academic freedom (Marginson, 2014). The US experience is thus informative in assessing global trends, both historical and contemporary, related to academic freedom. The overall success of US higher education and espoused allegiance to academic freedom by higher education institutions throughout the United States also provides a cautionary tale. Despite appearing as firmly entrenched and accepted in US higher education, in recent decades, the arrangements arrived at to safeguard academic freedom in the United States are increasingly under stress, even as the system continues to struggle to better mirror the nation’s racial and gender diversity in its faculty ranks and in higher education overall.

As noted, the development of higher education in the later part of the nineteenth century in the United States would be influenced by events in Germany related to freedom, teaching, and research (Sun and Hutchens, 2019). Prior to this period, colleges in the United States were not conceived as institutions to advance knowledge. Instead, colleges were largely viewed as places to preserve established truths and knowledge and to inculcate students with these established truths and to prepare them for service as ministers and as social and political leaders (Thelin, 2019).

As faculty members in the United States began to adopt and adapt practices imported from Germany related to research and academic freedom, they encountered institutional structures and social and political norms that were not conducive to the exercise of faculty independence in teaching and scholarship (Cain, 2018). Faculty members who offended powerful and influential members of society or institutional leadership could and did find themselves dismissed from academic positions. In a response to such incidents, efforts emerged to establish protections for the academic freedom of faculty members at US colleges and

universities. An important culmination in these efforts came with the formation of the American Association of University Professors (AAUP) in the early twentieth century. In 1915, the AAUP issued a Declaration of Principles on Academic Freedom and Tenure. The document specifically referenced the concepts of *Lehrfreiheit* and *Lernfreiheit* and described academic freedom as “compris[ing] three elements: freedom of inquiry and research; freedom of teaching within the university or college; and freedom of extramural utterance and action” (AAUP, 2015, p. 3).

A primary mechanism looked to by the AAUP to safeguard faculty academic freedom came in the call for the establishment of tenure for faculty members after a probationary period, so as to provide ongoing employment security for professors (Sun and Hutchens, 2019). In doing so, the AAUP sought to establish academic freedom as a professional norm in US higher education with economic security serving as the primary means to uphold the academic freedom and independence of faculty members. In the opening decades of the twentieth century, most US colleges and universities would move to accept the AAUP principles, resulting in the 1940 Statement of Principles of Academic Freedom and Tenure, which was endorsed by the AAUP and a prominent national association of colleges (Cain, 2018). It is important to highlight that the protections of tenure and academic freedom were distributed in widely inequitable ways from the start. Many individuals, notably women and men of color, were generally excluded from tenure-stream appointments at US higher education institutions. Today, serious challenges continue to remain in diversifying the US professoriate in terms of those individuals employed in tenure-stream positions.

Throughout the middle decades of the twentieth century, many US colleges and universities would adopt tenure as a standard practice, comprising part of what has been referred to as the “academic revolution” and the ascendance to prominence of US scholars and researchers (Jencks and Riesman, 1968). As a professional norm backed by formal employment arrangements, legal protections for academic freedom were grounded in the contractual relationship between a professor and the employing college or university (Sun and Hutchens, 2019). Under such a contractual relationship, a faculty member and the employing college are engaged in a continuing employment relationship that can only be ended by the institution for acceptable reasons, such as malfeasance, incompetence, or financial emergency. For public colleges and universities, the contractual relationship for tenured professors has come to have a constitutional aspect, as the US Supreme Court has interpreted an ongoing faculty employment agreement as providing a protected property interest that cannot be taken away by a public college or university without an adequate, lawful basis (e.g., *Board of Regents of State Colleges*, 1972).

From promising start to legal morass—academic freedom and the US Constitution

While tenure and academic freedom in the United States were conceived on the basis of professional standards and an ongoing contractual arrangement, a line of legal cases would result in an interpretation of the First Amendment to the US Constitution as an independent source of legal protection for faculty academic freedom (Kaplin et al., 2019; Sun and Hutchens, 2019). The development of a constitutional dimension to academic freedom arose during what is commonly known as the McCarthy era—a period in which fear of communism propelled efforts, often based on paranoia and unfounded accusations, to root out communists and communist influences in US society, including in educational settings. The US Supreme Court would grapple with issues of academic freedom in this environment.

In a 1952 case (*Adler v. Board of Education*), the US Supreme Court, in approving the firing of a teacher, Irving Adler, upheld a New York law that prohibited public employment, including in educational institutions, from individuals belonging to groups determined to be “subversive.” In a dissenting opinion in the case—that is, an opinion opposing the Court’s decision upholding the New York law and the dismissal of Adler—Justice William O. Douglas provided the initial mention of academic freedom in a US Supreme court case. Douglas warned against intrusions into educational settings and the disruption of academic independence. In that same year, Justices Felix Frankfurter and William O. Douglas in a concurring opinion in another case—that is, an opinion in agreement with a majority of the court on outcome but that seeks to further delineate particular points or to offer a substitute grounds for the decision—also looked to principles of academic freedom. The case involved faculty members in Oklahoma who successfully challenged a state-mandated loyalty oath that did not permit differentiation between “innocent” and “knowing” membership in an organization deemed as subversive (*Wieman v. Updegraff*, 1952). Frankfurter and Douglas offered the following sentiments in the concurring opinion:

To regard teachers—in our entire educational system, from the primary grades to the university—as the priests of our democracy is therefore not to indulge in hyperbole. It is the special task of teachers to foster those habits of open-mindedness and critical inquiry which alone make for responsible citizens, who, in turn, make possible an enlightened and effective public opinion They cannot carry out their noble task if the conditions for the practice of a responsible and critical mind are denied to them.

(*Wieman v. Updegraff*, 1952, pp. 196–197)

In 1957, The US Supreme Court decided a case with important academic freedom implications, *Sweezy v. New Hampshire*. Paul Sweezy, a Marxian economist, refused to answer questions during an interrogation by a governmental official, including ones related to lectures that he had given at the University of New Hampshire and his writings. As a result, Sweezy was held in contempt of court. A majority of the US Supreme Court, in overturning Sweezy’s conviction, relied partially on principles of academic freedom but did not squarely base its ruling on academic freedom grounds. In a well-known concurring opinion in the case, Justice Felix

Frankfurter, looking to a statement from a group of South African scholars, offered the “four essential freedoms” of a university: “to determine for itself on academic grounds who may teach, what may be taught, how it shall be taught, and who may be admitted to study” (*Sweezy v. New Hampshire*, 1957, p. 263).

The US Supreme Court’s support for academic freedom would hit a legal highwater mark in 1967 in *Keyishian v. Board of Regents*. Again considering the New York law at issue in *Adler* (1952), this time the court invalidated the provision on academic freedom grounds, with the court stating:

Our Nation is deeply committed to safeguarding academic freedom, which is of transcendent value to all of us and not merely to the teachers concerned. That freedom is therefore a special concern of the First Amendment, which does not tolerate laws that cast a pall of orthodoxy over the classroom. (*Keyishian v. Board of Regents*, 1967, p. 603, p. 603)

In subsequent legal decisions, such as in approving the use of race as a factor in higher education admissions (see, e.g., *Grutter v. Bollinger*, 2003), the US Supreme Court has periodically touted the importance of academic freedom, but its decisions and those from lower courts have also introduced uncertainty regarding the extent to which academic freedom is protected by the First Amendment to the US Constitution. For example, in a case involving the dismissal of a student for poor academic performance, the Supreme Court noted the importance of deference to higher education institutions as an exercise of academic freedom (*University of Michigan v. Ewing*, 1985). But, in a footnote in the case, the Court hinted at ambiguity over whether First Amendment academic freedom rights accrue to individual faculty members or to the institution or to both: “Academic freedom thrives not only on the independent and uninhibited exchange of ideas among teachers and students, ... but also, and somewhat inconsistently, on autonomous decisionmaking by the academy itself” (*University of Michigan v. Ewing*, 1985, p. 222, fn. 7).

Rather than developing clear legal rules grounded in academic freedom principles and matching the rhetoric found in *Keyishian v. Board of Regents* (1967), courts have largely looked to other legal standards in deciding cases that implicate faculty academic freedom (Kaplin et al., 2019; Sun and Hutchens, 2019). For example, courts have often turned to the legal standards dealing with the free speech rights of public employees in general in deciding claims by public university faculty that raise academic freedom concerns. However, a 2006 US Supreme Court decision, *Garcetti v. Ceballos*, threw this arrangement into doubt. In *Garcetti*, the Court ruled that a public employee does not possess First Amendment protection when engaged in carrying out their official employment duties. Since the *Garcetti* decision, lower courts have reached conflicting decisions concerning whether the standard announced in the case applies to faculty members in public higher education when issues of academic freedom are at stake, such as in research or teaching (Kaplin et al., 2019; Sun and Hutchens, 2019). This state of affairs exemplifies a general lack of clarity over academic freedom protections under the First Amendment of the US Constitution. In sum, the status of a federal constitutional dimension to academic freedom protections in the United States is presently enveloped by substantial legal disagreement and uncertainty.

Increasingly Fragile State of tenure in United States

The precarious legal status of First Amendment protections for academic freedom in the United States coincides with another trend with significant implications for the status of academic freedom in the United States—the erosion of tenure as a faculty employment arrangement at both public and private colleges and universities. The percentage of the US professoriate in tenure-stream positions has declined markedly in the past several decades. Now, overall, only about 25% of faculty members in the United States are employed in tenure-stream positions (Tolley, 2018). About another quarter of faculty members are not in tenure-stream positions but are employed full-time with employment contracts of varying lengths. Important variations exist in the employment arrangements for non-tenure-track faculty members in full-time positions. Some are employed on year-to-year work agreements and face annual uncertainty as to the renewal of their position, while some full-time, non-tenure-track faculty members work on multi-year contracts and have meaningful employment protections. In contrast to the economic security afforded by tenure or multi-year contracts, around half of professors in the United States are employed in part-time adjunct teaching positions. Some institutions rely heavily on adjunct professors. These positions often lack employment benefits, such as health insurance, and are precarious in terms of reappointment. In essence, these adjunct professors are excluded from the economic arrangements of tenure originally designed to safeguard the academic freedom of individual faculty members in the United States (see, e.g., Cain, 2018).

Academic freedom remains an espoused cornerstone of US higher education and continues, to varying degrees, an important value for many colleges and universities. Yet, the erosion of tenure and legal doubt over First Amendment protections for academic freedom create considerable uncertainty over the future of academic freedom in the United States. Rather than grounded in contract law or the First Amendment, protection for academic freedom is increasingly subject to the preferences and whims of institutional leaders and higher education governing boards. Recent efforts in some states to block the teaching of critical race theory, including in colleges and universities, highlight a system that is under some level of stress in relation to the future of academic freedom (Flaherty, 2021). Partisan attacks on higher education and on individual professors have only exacerbated that status of academic freedom in US higher education (Mele, 2016). With Covid-19, for instance, efforts by elected officials, including former President Donald Trump, to downplay or discredit the work of scientists, including at colleges and universities, represented a serious threat to the role of academic freedom in the United States (Graham, 2020; Tollefson, 2020). In a similar vein, climate change skeptics in the

United States, including elected officials, have sought to discount the overwhelming body of scientific evidence related to climatic change resulting from human behavior and the severe threats posed to the planet (Jackman, 2014). While academic freedom continues to occupy a central role in US higher education, the legal protections and political and social climates required to uphold academic freedom are under strain. As considered later, such types of threats to academic freedom are far from confined to the United States.

Academic freedom as a human right

In considering academic freedom from an international perspective, as Marginson (2014) states, it is important to recognize that the “research university is not an identical institution everywhere, any more than political cultures and other forms of social organization can be considered uniform” (p. 25). Accordingly, rather than a one-size-fits all approach, considerations of the independence faculty members need to accomplish their roles as teachers, scholars, and members of civil society must be viewed as nested in unique social and political contexts. For example, Marginson states that the exercise of academic freedom and scholarly independence in China are more likely to occur behind the doors of the academy rather than to be asserted in a public manner. He contrasts this approach with the regular conflation in US higher education of academic freedom protections with the general free speech rights that may apply when faculty members are speaking on matters beyond their area of scholarly expertise.

Even while keeping in mind the need to account for distinctive iterations of academic freedom among nations, there are some aspects that appear to be in common. In the push and pull of state authority and institutional autonomy, higher education institutions need the requisite autonomy to create conditions in which scholars possess sufficient independence to carry out their work, as do individual members of the academic community in relation to state authority. And within higher education organizations, institutional authority must not unduly encroach on the professional expertise and independence of members of the academic community, professors and students, to carry forward with their scholarly work. Whether at the state or institutional level, this kind of scholarly or academic freedom encompasses what Marginson (2014) has called “freedom from constraint or coercion” (p. 39).

Quinn and Levine (2014) observe how the concept of academic freedom remains underdeveloped in international law:

Human rights claims arising ... if they are brought, typically do not include claims for violations of academic freedom. (Here “claims” are understood broadly as including but not limited to complaints, petitions and other advocacy before United Nations, regional, sub-regional and national institutions competent to address alleged violations of human rights, including courts, tribunals, committees, commissions, ombudspersons and other regular or special procedures and mechanisms.) As a result the standards are underdeveloped relative to other human rights claims and the scope of academic freedom violations globally. This may be in part due to lack of familiarity with issues of academic freedom and the available standards for protection among human rights advocates (a fact which becomes negatively reinforcing), and in part to the fact that attacks on academic freedom often manifest as violations of other rights under which claims are brought (p. 211).

They assert that international human rights law provides a basis for recognition of academic freedom as an independent right grounded in the rights of freedom of opinion and expression and the right to education (Quinn and Levine, 2014). While acknowledging the difficulty of arriving at a singular definition of academic freedom, the authors, looking to UNESCO’s 1997 declaration on higher education teaching personnel, offer the “core” of academic freedom as

scholars’ right, without constriction by prescribed doctrine, to freedom of teaching and discussion, freedom in carrying out research and disseminating and publishing the results thereof, freedom to express freely their opinion about the institution or system in which they work, freedom from institutional censorship and freedom to participate in professional or representative academic bodies. (Quinn and Levine, 2014, p. 212) (quoting from UNESCO 1997 Recommendation Concerning the Status of Higher Education Teaching Personnel)

Additionally, Quinn and Levine (2014) contend that for academic freedom to flourish in a practical sense, it has to be viewed as connected to related values, including access to higher education, sufficient autonomy of institutions to support the work and activities of individual members of an academic community, physical safety, and social responsibility (p. 213). Rather than depict academic freedom solely as an internal dynamic for higher education, the authors also view research and scholarship as linked to the larger society in which scholars are located. From this perspective, support for academic freedom is nested within and tied to overall “democratic values” and involves the responsibility of “scholars to engage with society outside of the classroom, laboratory or campus, and in return providing some measure of protection for what otherwise might be construed as extramural activities” (Quinn and Levine, 2014, p. 213). Even if an activity is more appropriately labeled as “personal” or “political” in nature as opposed to academic, the authors note that other human rights protections can still apply (Quinn and Levine, 2014, p. 213).

In their examination of academic freedom, Quinn and Levine (2014) consider the mission and work of Scholars at Risk (SAR), a group committed to furthering academic freedom protections worldwide. They describe how SAR views protection for academic freedom as encompassing three, overlapping areas, (1) issues related to “core and socially-engaged understandings of academic

freedom,” (2) that higher education teaching personnel also require the civil, political, social, and cultural protections afforded to all citizens (quoting from the [UNESCO 1997](#) declaration on higher education teaching personnel), and (3) and that violations of core rights impede academic freedom based on individuals directly affected and by “third parties intimidated by attacks on others” ([Quinn and Levine, 2014](#), p. 213).

In terms of a specific grounding for academic freedom rights, [Quinn and Levine \(2014\)](#) contend that academic freedom should constitute an independent human rights claim in proceedings brought before national and international bodies, such as courts or tribunals. They view academic freedom as emanating from the rights of opinion and expression and right to education under Article 19 of the International Covenant on Civil and Political Rights and Article 13 of the International Covenant on Economic, Social and Cultural Rights, as well as similar declarations of rights from other U.N. sources and from “major regional human rights systems” ([Quinn and Levine, 2014](#), p. 216). Additionally, the authors point out that infringements on other rights can be used to undercut academic freedom. The authors consider how arbitrary arrests and deprivations of liberty, restrictions placed on “travel and movement,” dismissal or loss of position as a form of retaliation or on illegitimate grounds, and censorship and restricting access to research findings as ways in which academic freedom rights can be impeded or denied.

Similar to [Quinn and Levine \(2014\)](#), [Beiter et al. \(2016\)](#) argue for the recognition of academic freedom as a human right. They discuss how academic freedom is not specifically mentioned in two of the major international U.N. human rights agreements, the International Covenant on Civil and Political Rights (ICCPR) or the International Covenant on Economic, Social and Cultural Rights (ICESCR). However, they point out that “there seems to exist consensus that the Covenants should be considered to protect that right” ([Beiter et al., 2016](#), p. 110). The authors, like [Quinn and Levine \(2014\)](#), look to multiple international provisions as protective of academic freedom rights, such Articles 19 (right to freedom of expression) and 15 (right to freedom of scientific research) of the ICCPR. The authors point especially to Article 13 of the ICESCR (the right to education) as “the provision which assembles all aspects of academic freedom under “a single roof” and whose normative context provides the proper framework for interpretation” ([Beiter et al., 2016](#), p. 111).

[Beiter et al. \(2016\)](#) offer the following as to their interpretation of Article 13 of the ICESCR as providing the most appropriate home for academic freedom in current international human rights law:

[A]cademic freedom entails much more than free speech rights as covered by the right to freedom of expression—a right, in fact, accruing to each and every person. Academic freedom also covers rights of “free action,” and the free speech rights covered are, in fact, *special* speech rights, conditioned by the dictates of learning, teaching, and research. An approach based on Article 13 also best accommodates the special responsibilities of institutions of higher education and their academic staff in discovering new knowledge and facilitating ethical individualism, adequately emphasizes the special vulnerability of teachers and researchers in higher education to undue pressures, and correctly recognizes that academic freedom must also serve as an organizational principle in structuring the activities of institutions of higher education. The “ordinary” right to freedom of scientific research, as protected in Article 15 of the ICESCR, accrues to each and every person doing research. Although it is highly relevant in this regard too, of course, it lacks a specific reference to the higher education context, where the claim to the protection of free inquiry is the most acute (p. 112).

Alongside international human rights laws and agreements, in their examination of academic freedom, [Quinn and Levine \(2014\)](#) consider how laws and standards in some nations provide academic freedom protections, either through explicit language or indirectly so that academic freedom constitutes an explicit or implied right. Countries may also, they note, incorporate into their laws and constitutions provisions from standards in international human rights treaties. The authors reported in 2012 that some “20 state constitutions include explicit protections, 99 direct protections, and 77 indirect protections” for academic freedom ([Quinn and Levine, 2014](#), p. 233). According to the authors, more recent constitutions are more likely to provide specific language related to academic freedom.

Challenges and opportunities for academic freedom

While keeping in mind the need to avoid a narrow view of academic freedom, there are clear indications that academic freedom is under stress in many countries, a situation that is not new. Writing twenty years ago, [Altbach \(2001\)](#) stated, “In many parts of the world, academic freedom is under attack,” and he further observed that “[a]cademic freedom is by no means secure worldwide” (p. 205). At the same time, he held out “considerable cause for optimism” in pointing to the states that were part of the former Soviet Union and nations in Central and Eastern Europe as having attained “reasonable levels” of academic freedom ([Altbach, 2001](#), p. 25). Improving academic freedom in areas that were part of the Soviet Union is important because the USSR’s oversight of scientists and universities led it to go against the global trend of increasing scholarly publications during the later 20th century ([Powell et al., 2017](#)). While reasons for optimism exist in the second decade of the 21st century, there are many challenges to academic freedom around the world, with academic freedom still “under attack in many places” ([Kinzelbach et al., 2021](#), p. 4). In its 2020 report on academic freedom, *Scholars at Risk*, a New York-based organization that monitors and advocates for academic freedom around the world and was mentioned earlier, reported that from September 1, 2019, to August 31, 2020, it documented 341 incidents worldwide that were attacks on academic freedom, including 124 acts of killing, violence, or disappearance (p. 4). Another 148 individuals faced imprisonment or prosecution.

Events in specific countries or regions can help illustrate the types of challenges to academic freedom that exist around the world. In Hungary, for instance, the government has enacted legislation in recent years that encroaches on the autonomy of higher education institutions and academic freedom (Corbett and Gordon, 2018). In writing about Hungary, Anne Corbett and Claire Gordon (2018) also comment more broadly on emerging challenges to academic freedom in Central and Eastern Europe from governmental action, such as “influencing or determining key university leadership appointments, controlling and directing funding sources, controlling or influencing research agendas, vetting research and publication, and revoking a university’s license” (p. 470). Still, the authors point to some reasons for optimism regarding forces to advance academic freedom in Europe, including Central and Eastern Europe. These include potential support for academic freedom coming from the participants in the Bologna Process and “voluntary but widely accepted European lines of support for academic freedom” (Corbett and Gordon, 2018, p. 472).

To give another example of challenges to academic freedom, in recent years, academic freedom and institutional autonomy appear increasingly under strain in India. Writing of post-colonial Indian higher education, Sundar (2018) stated that three major commissions on higher education in the nation had all pointed to the importance of institutional autonomy and “freedom of thought, expression, and research” (p. 51). Despite these pronouncements, the author warns of growing threats to freedom of teaching and research in India, such as restrictions on curricula (see also, Lau, 2019). Scholars at Risk also highlighted in the aforementioned 2020 report alarming events in India related to academic freedom, such as violent attacks on and retaliation against students in Kashmir.

In Hong Kong, the government has increasingly cracked down on dissent, including that arising from universities (McLaughlin, 2021). In June 2020, China implemented a National Security Law that resulted in the arrest of scholars in Hong Kong for their participation in protests, the canceling of campus events, and the suppression of student speech (O’Malley, 2021). Turkey has shown a consistent willingness to stifle the views of academics (Redlawski, 2021). Russia has also grown increasingly authoritarian in its treatment of faculty members (Schiermeier, 2021). Some African countries have made notable progress in protections for academic freedom, but many nations in the region are “lagging behind” in building and sustaining robust systems for the protection of academic freedom and institutional autonomy (Appiagyei-Atua et al., 2016, p. 110). During the Covid-19 pandemic, scholars from multiple nations have faced retaliation, including arrests, for Covid-19 research and related activities (Scholars at Risk, 2020). The greater use of online teaching modalities during the Covid-19 pandemic also meant that governments had an enhanced ability of oversight and coercion of classroom environments and course content (see, e.g., Bergan et al., 2021). Threats to academic freedom have also been identified based on continuing marketization of higher education (Altbach, 2013). As covered previously, the future foundations of academic freedom in the United States are uncertain given the erosion of tenure as a faculty employment arrangement.

In relation to China, Qiang Zha and Wenqin Shen (2018) consider tensions between China’s efforts to establish world-class research universities and the traditional role of the state in regulating higher education institutions, which reflects the legacy of the “Chinese Confucian knowledge tradition” (p. 448). Within this tradition, the authors note an emphasis on “collective well-being” and serving and upholding the social order and the government. Nonetheless, they point to possible avenues for enhanced academic freedom in China, which could especially prove beneficial to scholars in the humanities and social sciences. Specifically, influences from Neo-Confucianism and Western-based concepts of academic freedom “have enabled more and more Chinese scholars to seek intellectual freedom” (Zha and Shen, 2018, p. 452). Additionally, Zha and Shen (2018) emphasize that

... [A]cademic freedom in China does not have to exactly mirror Western notions. Academic freedom is not absolute, and like freedom itself, it is often conditioned by particular historical and social contexts. In this sense, a kind of Chinese-flavored academic freedom could emerge to allow Chinese institutions of higher education to become the world-class institutions to which they aspire (p. 452).

The introduction in 2020 of the Academic Freedom Index (AFi) added a helpful tool to further understanding of the status of academic freedom globally. The AFi was developed by researchers at FAU Erlangen-Nürnberg, a German research university, the Global Public Policy Institute, a think tank based in Berlin, and Scholars at Risk, an organization covered earlier (Redden, 2020). The index provides a calculation of the current status of academic freedom in specific countries based on the following criteria: “(1) freedom to research and teach; (2) freedom of academic exchange and dissemination; (3) institutional autonomy; (4) campus integrity; and (5) freedom of academic and cultural expression” (Kinzelbach et al., 2021, p. 6). These criteria are described as *de facto* factors and evaluated by “independent experts” for each country using a “pre-defined scale” (p. 6). Additionally, the index is informed by “some additional, factual indicators, assessing states’ *de jure* commitments to academic freedom at (6) constitutional and (7) international levels, as well as (8) whether universities have ever existed in a given country” (p. 6).

The developers of the AFi urge its use by a variety of stakeholders, such as governments, international organizations, university leaders, and advocacy organizations (Kinzelbach et al., 2021). Organizations that provide funding to higher education are encouraged to use the index in efforts to recognize countries where students or staff could be more at risk, as a criterion in funding decisions, and to assess the need for specialized preparation or training based on conditions in specific locations.

One intriguing suggestion is for groups that conduct prominent university rankings to take academic freedom scores into account in compiling such rankings so that “[i]f a certain country scores badly on the AFi, then all universities in that country should be subject to a reduction of their score in a ranking” (Kinzelbach et al., 2021, p. 25). Developers of the AFi state that inclusion of academic freedom in university ranking systems “would create strong incentives for university rectors and governments who value

and act on these prestigious rankings to take steps to strengthen academic freedom. Universities that want to be ranked could also be asked to file a written commitment to academic freedom as a precondition for being assessed" (Kinzelbach et al., 2021, p. 25). For nations and higher education institutions motivated by such rankings, inclusion of an academic freedom criterion could help promote the development of standards and practices supportive of academic freedom.

The most recent report on the AFI highlights the need for innovative strategies and continuing efforts to advance academic freedom around the world. The majority of the 175 countries covered in the second iteration of the AFI do not protect academic freedom at the highest level, with the countries grouped in the index into A (highest score), B, C, D, and E (lowest score) categories using a scaled score from 0 to 1 (Kinzelbach et al., 2021). According to the report, Brazil, Columbia, Hong Kong, Nicaragua, Turkey, and Zambia experienced the sharpest declines in academic freedom over the past five years (Kinzelbach et al., 2021, p. 15). In contrast, scores over the past five years improved the most in Kazakhstan, Maldives, North Macedonia, Sudan, and The Gambia. As covered in the report, the existence of academic freedom provisions in constitutions or laws does not necessarily equate with actual strong protections of academic freedom, with "more than one-third of countries with the worst performances in 2020 (a "D" or "E" status, that is AFI < 0.4) hav[ing] such *de jure* guarantees in place while extensive violations of academic freedom occur in practice" (Kinzelbach et al., 2021, p. 9).

The Academic Freedom Index indicates that academic freedom is strongly to moderately protected in many countries, but it also shows this is not the case in many nations. Realization of academic freedom as a global right represents a work in progress in many places. And, as shown in the AFI report and from the country-specific examples included in this entry, protections for academic freedom are subject to erosion or to new threats.

Conclusion

While the contours of academic freedom are flexible and adaptable based on national context and history, wide agreement exists that academic freedom is crucial in higher education. Academic freedom is not intended to accrue to individual scholars for their personal benefit, but, instead, is meant to allow them to perform their roles as teachers, researchers, and members of civil society. Academic freedom also envelops students and the larger society and contributes to the overall vitality of a nation. An integral facet to the academic freedom of scholars is the independence to carry out their work without undue governmental encroachment or limitations. As shown in the Academic Freedom Index covered in this entry, there are numerous nations in which the current status of academic freedom appears strong. However, there are many countries, as indicated by the index, where academic freedom protections are marginal to seemingly non-existent. As considered in this entry, even for a nation like the United States—which receives a strong score on the Academic Freedom Index—arrangements designed to safeguard academic freedom, notably tenure, are under increasing stress. The uneven distribution of academic freedom protections and increasing threats to academic freedom in some nations and regions reveal ongoing challenges to academic freedom from an international perspective. Crucial challenges exist for researchers, higher education institutions, policymakers, governments, and advocacy groups to protect and advance academic freedom protections around the world.

Funding higher education: the key issues

With higher education tuition fees and student debt rising and government budgets allocated to universities and colleges showing little signs of decreasing, the financing of higher education is an often debated issue. Questions are raised in political debates, policy reviews and academic discussions about issues such as escalating cost burdens (Clotfelter, 1996), improving efficiency (Massy, 2004), the rates of return on investment in higher education (Blöndal et al., 2002; Boarini and Straus, 2007; Psacharopoulos, 1981) and finding adequate ways of resourcing higher (or tertiary) education (OECD, 2020). In this contribution we will present an overview of some of the literature on the critical issues around higher education funding. This overview will be presented around a few key questions that are introduced below. In addition, we will also show some of the differences that exist between countries in how they have addressed the key funding-related issues.

Funding is never an end in itself. It is always a means to an end. For governments and students alike, the resources that are dedicated to higher education are regarded as an investment—a means to encourage the building up of knowledge and skills through (higher) education. Through supporting their research universities, governments promote research—basic, applied, strategic research; they encourage the pursuit of knowledge for its own sake as well as for supporting the technological and social innovations in today's knowledge-driven societies (Salmi, 2003). Thus, countries, states and regional governments invest in higher education to promote economic growth (Nelson and Phelps, 1966) and innovation (Acemoglu, 1997; Redding, 1996). Higher education, therefore, is a tool for creating individual and national competitive advantage—a means to contribute to the well-being of nations (Healy and Côté, 2001).

In deciding on the funds invested in higher education, the governments and citizens of countries need to make important choices. They face trade-offs in using scarce resources to achieve multiple goals and will need to keep an eye on the instrumental objectives of efficiency (getting the most we can from the scarce resources) and equity (distributing the benefits in a fair way among the members of society). In many ways, these are choices of a political-economic nature (Garritzmann, 2016). The choice of goals to pursue is very much an outcome of a political process that can be informed by academic research and expert advice on the benefits and costs of particular policy options. Some of these policy evaluations—the ones directly related to funding reforms—will be mentioned in the remainder of this text.

In this entry to the encyclopedia we will discuss higher education funding through the following key questions that are relevant for all higher education systems:

1. How much is spent on higher education (or spent per student, per graduate, or per measure of research activity)?
2. What is the share of private spending (by students; households; companies) on higher education as compared to the public (i.e., government) spending?
3. How are public funds made available to higher education institutions?

Answers to these questions are very much driven by policymakers' choices and what they regard as constituting an efficient and fair system of financing higher education. In the following sections, we will touch upon these three key questions, starting with the first two in the next section.

Before addressing the third question, we will present a broad overview of the different revenues of higher education institutions—showing the variety of their revenue sources. We then continue with a typology of the mechanisms that determine the core funding that higher education institutions receive from the government.

In the final sections of this article we touch upon the question of whether the type of funding matters for the functioning of the higher education system—its diversity, and some of the dimensions related to the performance of the system. To encourage that performance, many governments over the years have introduced reforms in the way they fund their higher education institutions. The emergence of performance-based funding and competitive funding are examples that will be discussed here. Both examples are

manifestations of an increased reliance on market-type steering approaches in higher education—a trend also known as new public management.

How much is spent on higher education? By whom?

When it comes to the volume of resources spent on higher education, the broadest measure is total public and private spending on higher education. Here, we see large differences not just between the developed and less-well developed countries in the world, but also between countries within these two broad groups. The wealth of countries is one reason for these differences, but so are the priorities attached to higher education. Even among OECD countries—the richest countries in the world—we see quite substantial differences. **Fig. 1**, based on the OECD's Education at a Glance database (OECD, 2021) ranks 22 OECD countries on the basis of their higher education expenditures.

Public spending includes not just the higher education institutions' operating grants for the purpose of education, research and other activities (capital expenditures; community services), but also the payments that governments make to students as part of the student support system. In 2018, the OECD countries shown in **Fig. 1** on average spend about 1.4% of GDP on higher education from public and private sources - two-thirds of it on average coming from public and one-third from private sources (OECD, 2021).

Fig. 1 also reveals wide differences in the share of public spending versus that of private spending. The Nordic countries (Norway, Denmark, Sweden, Finland) stand out with generous public spending, whereas Anglo-Saxon countries such as the UK and the US spend much less from the public purse. Western European countries invest quite considerably in higher education, while Eastern Europe and some Southern European countries score in the middle of the distribution. **Fig. 1** also shows that private expenditure on higher education is particularly high in the Anglo-Saxon countries, especially in the US. The same is true for both Korea and Japan. In these countries, the level of tuition fees is relatively high.

The increasing demand for higher education, the rising per-student costs, and the budgetary restrictions facing many governments have triggered the introduction of tuition fees. Cost-sharing is the term often used for this trend (Johnstone and Marcucci, 2010). Cost sharing reflects the shift in the higher education cost burden from governments (or taxpayers) to parents and students. It encompasses the introduction of (or sharp increases in) student tuition fees, student user charges, and substituting student grants for student loans.

Several countries have introduced cost-sharing policies (Teixeira et al., 2006). At the same time, and to ensure that (potential) students are not deterred by the financial burden erected by tuition fees, governments have started to provide financial support to students. Providing income-contingent loans (ICLs) to students who cannot or do not want to pay the tuition fees and wish to defer

Note: 1. Figures are for net student loans rather than gross, thereby underestimating public transfers.

Fig. 1 Total expenditure on higher education institutions as a % of GDP, by source of funds for the year 2018. Note: 1. Figures are for net student loans rather than gross, thereby underestimating public transfers. Based on OECD (2021), Figure C2.2 (<https://stat.link/n2rbd1>).

their payments is an innovative method of supporting students in meeting the costs of higher education. ICLs were introduced in Australia (Chapman, 2006) and have become more widespread over time.

Clearly the discussion on the balance between public and private contributions and how to pay for higher education is a politically sensitive issue, with countries showing a variety of approaches and models (Cantwell et al., 2018; Garritzmann, 2016), depending on the value they place on the public benefits (i.e., externalities) of higher education versus the private (say, individual) benefits. Clearly, this issue is linked to questions around efficiency and equity.

Following the OECD, we can divide countries into four groups, depending on tuition fee levels and student support availability (e.g., OECD, 2008, p. 275). Table 1 places countries in these four groups, using a share of 50% of the students benefiting from student support and a tuition fee level of (roughly) USD 4000 as the cut-off points for making distinctions between groups. The Nordic countries have a student support system that is relatively generous and their students pay no fees. All of them are social-democratic regimes that have a progressive tax structure and comparatively high income tax rates. In many countries in continental Europe, students are charged low or moderate fees (with the exception of the Netherlands). In the more liberal welfare states (in the bottom of the table), governments stress the private benefits of investing in higher education and expect their students to pay a higher share of the cost burden; expecting the majority to use student loans to cover education costs.

The funding environment for higher education institutions

In light of the evidence that investments in (higher) education (say, human capital) are beneficial to economic and social development (Healy and Côté, 2001), the public budgets for higher education have grown considerably over time (Johnstone, 2004). And with higher education being such a large part of the public sector (see indicator C4 in OECD, 2021), there is increasing scrutiny on how public resources for higher education are allocated and used—for education, research, student support, infrastructure, staffing, campus development, etcetera. At the national (i.e., federal, country, state) level, reforms in educational financing are frequently debated in policy circles to identify the funding mechanisms that produce the best outcomes in terms of guaranteeing access for students, high-quality education, and high-quality research, as well as connecting this education and research to the needs of society.

Before looking at those funding reforms, let us first discuss the different channels through which higher education institutions receive their resources. Fig. 2 provides an overview of the funding environment of higher education institutions. It shows the different funding streams and their sources, and illustrates the different levels of decision-making dealing with the allocation of financial resources. It also displays how funding is the outcome of a complex and nested set of processes that involves multiple authorities, agencies and entities. Each of these actors will have its own goals, preferences, rules and instruments and their decisions on resource allocation and revenue generation are embedded in a broader political and budgetary context.

Core funding is in the center of the picture. It represents the basic (i.e., annual, recurrent) funding allocated by the government from its higher education and research budget for the general functioning of the higher education institutions. This core budget is then redistributed by the higher education institution to its various departments and organizational units.

Student support is provided to students in various ways. It can consist of grants, loans, vouchers and support for the students' parents. Part of this will be used by students to pay for the tuition fees charged by higher education institutions. The type and the level of the fees will depend on a country's regulatory system and the legal status of the institution (i.e., public, private, for-profit, not-for-profit).

A third funding stream originating from the public sector consists of research grants awarded by research councils operating on behalf of (but largely independent of) the public authorities. This funding stream directly flows to the researchers and research groups in the university. In many cases, these grants are awarded selectively, with researchers submitting project proposals to research councils that, after a peer review process, decide which research projects receive funding. The funding is targeted to a particular project and awarded for a specific period of time. Allocations aimed at creating centers of excellence constitute another example of the indirect, non-core funding of higher education institutions.

Again, countries will differ in terms of the shares of competitive funding in their system and the degree of competition experienced by researchers. Countries also show structural differences in the number and functions of the public research organizations that exist next to the research universities. The size of this sector also will determine the research budget of the university sector.

Table 1 Student support and tuition fees in world regions (situation: 2017/18).

	<i>Less than 50% of students benefit from public loans AND/OR scholarships/grants</i>	<i>More than 50% of students benefit from public loans AND/OR scholarships/grants</i>
Below average (or zero-fees) charged by public HEIs	Most of continental Europe	Nordic countries
Above average tuition fees charged by public HEIs	East Asia	Anglo-Saxon countries

Author, based on OECD's Education at a Glance OECD (2021).

Fig. 2 The funding environment of higher education institutions. Extended from Lepori and Jongbloed (2018).

Shown on the bottom right hand side of Fig. 2, supranational governments, such as the European Commission, also award project funding and research grants to researchers. The European Commission also provides financial support to students and researchers (e.g., Ph.D. candidates) to encourage international mobility.

Research funds from private sector organizations (both for-profits and non-profit organizations) and their payments for education and research services constitute another part of the non-core funds of higher education institutions. In some countries, these private organizations provide gifts and donations to higher education institutions—for endowed professorships, for infrastructural facilities (e.g., libraries, labs) or to support the general funds of the institution.

In most countries, the core funds represent the largest share of the higher education institution's budget. These institutional funds provide the institution with some stability in the support of their education and research activities. In most cases the core funds are allocated as a lump sum payment—one block grant for the carrying out of education and research. This allows the institution to decide on the use of the funds and set its own priorities. As part of this, higher education institutions act strategically (Bonaccorsi and Daraio, 2007), building up their strengths and capabilities, and competing for project funds and other third party funding. In this context, higher education institutions are diversifying their funding sources (De Dominicis et al., 2011) acting entrepreneurial in an almost businesses-like way, competing on markets for resources, students and academic staff (Deiaco et al., 2010; Teixeira et al., 2004). Some authors (e.g., Slaughter and Rhoades, 2004) have used the term academic capitalism to describe this development. Academic capitalism describes the phenomenon that universities are turned into knowledge producing enterprises, competing for capital accumulation and trying to turn their findings into patents and profitable commodities.

How are public funds made available to higher education institutions?

Now that we have looked at the funding environment for higher education institutions, let us consider the different approaches—allocation mechanisms—that national (or state) governments use to determine the volume of core funds allocated to their higher education institutions. In many countries—certainly in Europe—this core funding represents the largest share of the revenues of higher education institutions. In times of multiple claims made on public budgets, there is increasing scrutiny on how public resources for higher education are allocated to higher education institutions and how these resources are used.

In Fig. 3 we classify the different mechanisms that can be employed. The figure distinguishes formula-based and negotiations-based approaches, as well as approaches where the previous years' allocations drive the core funding (and where allocations are often adjusted in an incremental way). These approaches intersect with funding methods that focus on performance, respectively inputs.

In formula funding, the core funds are calculated through one or more mathematical formulas, based on a set of predefined parameters and indicators. The formula will typically include volume measures (e.g., student enrollments per degree program) and price components (i.e., unit costs—or prices), where the latter are set with a view to the cost of delivering a particular unit in terms of education or research.

The main aim of a formula is to treat all higher education equally—according to the same formula, thus providing transparency in the funding decisions. The variables and parameters in the formula—e.g., the funding basis and the funding weights—will be

Fig. 3 Core funding mechanisms. Author inspired by [Claeys-Kulik and Estermann \(2015\)](#).

specified by the funding authorities in such a way that they align closely to the broader higher education policy priorities of the government, allowing for changes to be made to the parameters over time ([OECD, 2020](#)).

Funding formulas often include a mix of input and output (i.e., performance) indicators, along with their weights to stress higher resource needs or higher priorities attached to particular activities in education or research. For instance, a higher weight might be applied to indicators related to the number of students from a particular group (e.g., students with disabilities, or from a disadvantaged background). In this way, funding authorities have a way to express policy priorities.

In the United States, funding formulas have been in use since the 1960s ([Lasher and Greene, 1993](#); [Lasher and Sullivan, 2004](#)). In Europe, its introduction is of a more recent date ([Kaiser et al., 2001](#)). Initially, funding formulas predominantly included education-related indicators and parameters. Simple input indicators were used, such as the number of students and the cost of instruction weighted by disciplinary field. Another example of an input measure is the staff volume of an institution or its floor space.

With the introduction of New Public Management approaches in the public sector in the 1990s ([Ferlie et al., 1996](#)), many countries have reformed the ways in which their higher education institutions are funded and have started to introduce measures of the institutions' performance in the funding formula ([Jongbloed and Vossensteyn, 2016](#)), thus creating a quasi-market environment ([Herbst, 2007](#)). Through performance-based funding ([Burke, 2002](#)), institutions are rewarded for delivering particular outputs; they are incentivized to pay more attention to degree completion, their students' time-to-degree, the amount of credits accumulated by students, research productivity, citation rates, et cetera.

In negotiated funding systems, shown in the bottom-half of [Fig. 3](#), the amount of core funding allocated to an institution is an agreed budget negotiated between funding authorities and the individual institution. Traditionally, these negotiations were about staff (e.g., the number of professors), infrastructure needs (e.g., lecture halls, laboratories) and students to be admitted to the institution. All of these are input-related criteria. In the traditional budget approaches—shown on the right-hand side of [Fig. 3](#)—those negotiations dealt with a large number of separate line items, such as salaries, materials or infrastructure costs. Line items then were adjusted using parameters such as the rate of inflation, and next year's core budget would be heavily based on the previous year's line items.

Over time, such historical and primarily input-based approaches have been replaced by more transparent, indicator-based systems and funding formulas. In addition, and once again inspired by the market-based approaches aligned with new public management, funding authorities have started to introduce performance criteria in the negotiations-based approaches. In some countries this resulted in a system of core funding that is—at least partly—based on “performance agreements” ([de Boer et al., 2015](#)). In the case of a performance agreement, the funding authority and each individual higher education provider agree on the goals for the institution to achieve and the plans it aims to carry out for the years ahead. A part of the institution's core funds is tied to the realization of those goals. The goals can be described in qualitative terms (e.g., improve equal access of men and women to senior academic positions, improve access for disadvantaged students), but they can also be specified using quantitative indicators (e.g., targets in terms of an increase of completion rates, the number of female professors, or the intake of Ph.D. students). The ways and details in which performance agreements are laid out will depend on the rationale for the agreements and the goals that the national authorities have for their higher education system.

The agreement also specifies the “rules of the game,” in terms of the evidence that needs to be delivered by the institution to the funding authorities and the positive or negative financial consequences connected to meeting the goals. Performance agreements thus are expected to encourage higher education institutions to improve their performance and to act strategically—in line with their ambitions, strengths and weaknesses.

Performance-based funding

The way in which funds are allocated matters, because it affects the behavior of those (i.e., the higher education institutions, students, researchers) receiving them. Performance-based approaches are increasingly employed in Europe (Claeys-Kulik and Estermann, 2015) and North America (e.g., Dougherty et al., 2016; Jongbloed and Vossensteyn, 2016) as a leverage to achieve national goals. In many countries, improving completion rates and limiting drop-out are key objectives underlying funding reforms and the introduction of performance-based funding.

Jongbloed et al. (2022) describe that sixteen of the 27 European Union member states nowadays include an indicator related to completion in their funding formulas or performance agreements, and several European countries include measures of research performance in their formulas for awarding core funding to universities. A classic example of the latter is the formula used in the United Kingdom for determining research funding allocations on the basis of peer review scores awarded in research assessments (Barker, 2007).

Performance agreements have been implemented—under several names (e.g., performance contracts, development contracts, strategic mandate agreements) and in various forms—in European countries (e.g., Austria, Croatia, Denmark, Finland, Germany, Ireland, the Netherlands, Scotland), Asia (Hong Kong, Japan), Australia, Canada, and the USA (de Boer et al., 2015; Jongbloed and Vossensteyn, 2016; Jongbloed et al., 2022).

Performance agreements allow institutions to select and negotiate their goals with an eye upon their individual context, strengths and key stakeholders. Therefore, performance agreements allow for a more tailored approach to higher education funding compared to the more one-size-fits-all formula-based approaches that make use of a uniform formula and a small set of indicators applied to all institutions in the higher education sector. Because of this, the performance agreements can help to increase mission diversity in the higher education system (Van Vught, 2008), next to their main goal of increasing performance.

Policymakers often see performance-based funding as a useful tool in connecting funding to measurable indicators. However, there is a lack of conclusive evidence that performance funding results in significant improvements in student outcomes (Hillman et al., 2015; Ziskin et al., 2018). While there is substantial research on whether performance-based research funding systems affect research performance (e.g., Hicks, 2012), much less research is available on the impact of performance-based education funding. The available research mainly focuses on the experience of the USA (Hillman and Corral, 2017; Kelchen, 2018), although some work has been done on the Nordic countries (Aagaard, 2015; Kivisto et al., 2017; Mouritzen and Opstrup, 2020) and the Netherlands (Jongbloed et al., 2019). For the United States and Denmark there are indications that performance-based education funding raised the instructional efforts of the institutions, encouraging them to make improvements in their programs and services (Dougherty et al., 2016; OECD, 2020, p. 90).

Evidence showing improvements in completion and graduation rates is, however, limited. Existing empirical studies are restricted to specific (country) cases and limited aspects of performance, making it difficult to generalize their findings. In a recent study on European countries, it was concluded that performance-based funding does seem to contribute to a higher degree of goal orientation and helps increase transparency and accountability around public spending on higher education (Jongbloed et al., 2022). In the USA and Europe, performance-based funding has been linked with higher research productivity (Dougherty and Natow, 2019), e.g., in terms of publication patterns. Yet, a recent study (Ward and Ost, 2021) on its effects in two US states (i.e., Louisiana and Tennessee) found no evidence that these programs improve key academic outcomes.

Performance-based funding also has led to debates about unintended negative consequences. In particular in case mitigation measures are not adequately accounted for in the design of the funding system. An often-heard concern is that institutions may be tempted to lower the quality of student learning, placing quantity above quality (de Boer et al., 2015). On the same note, institutions may start reducing the intake of students from disadvantaged socio-economic backgrounds in the belief that these students have a lower chance of completing their program successfully (Dougherty et al., 2016). This may have consequences for student access; making higher education institutions place a lower priority on their equity objectives.

In Slovakia, performance-based funding has been linked to researchers publishing in lower-quality “predatory” journals and increasing their citations of close colleagues (Pisár et al., 2019). In Poland, the use of research outputs in the funding formula has led to insufficiently productive staff being reassigned to a teaching path in economics universities (Jelonek and Mazur, 2020).

Furthermore the use of performance elements in funding formulas potentially increases the homogeneity in the higher education system, as it may lead to risk-avoiding behavior among institutions and faculty. A uniform funding formula may induce institutions to focus their education and research activities on the more easily achievable outputs (OECD, 2020). In the USA, performance-based funding was associated with more short-term certifications being awarded, a higher selectivity in student recruitment, and a lower academic quality (Li, 2018). In Italy, performance-based funding is linked to a greater stratification in the higher education landscape (Mateos-González and Boliver, 2019). These negative effects have sometimes been countered by changes in the funding system, in the form of weight adjustments, a redefinition of indicators, and/or the use of regulatory instruments (Bennetot-Pruvot et al., 2015).

The question whether funding systems—be they input- or performance-based—ultimately have an effect on the behavior of higher education institutions is difficult to answer. Funding systems are embedded in the broader (national and international) governance context for higher education. This makes it difficult to isolate the effect of performance-based funding from the effects of other institutional arrangements and incentive structures. Furthermore, performance-based systems come in various shapes and sizes. For instance, the share of core funding tied to performance differs substantially across countries (e.g., Jongbloed et al., 2022), and so does the share of competitive (e.g., project-based) funding in the “funding mix” (Lepori and Jongbloed, 2018). Finally, there

are various dimensions of performance—as part of the institutions’ education, research and societal missions. In other words, every case is in some way unique and general conclusions are difficult to make. The available overview studies and meta reviews that synthesize the existing research on the impact of performance-based funding (e.g., Hillman et al., 2015; Kivistö and Kohtamäki, 2016; Ortagus et al., 2020) often have difficulty drawing firm conclusions on the matter, or at best find no effects at all.

Final observations

This contribution has shown that the topic of funding of higher education leads to many questions. We looked at questions of “how much, who pays, what types and what conditions of funding?” It became clear that the answers to the questions differ across the higher education systems in the world, depending on a country’s wealth, its political priorities and its approach to the governance of government-dependent institutions. Funding arrangements are adjusted regularly—to address the needs of society and to incorporate lessons from experience—both at home and abroad. Governments and funding authorities will constantly be looking for the most cost-efficient, yet least intrusive type of funding system to steer their universities and colleges in delivering on their missions.

The multiple objectives and dilemmas surrounding resource allocation in higher education touch upon issues of the balance between (1) public and private investments in higher education; (2) equity and efficiency; (3) input-based and performance-based approaches for the funding of higher education, (4) the room for competition between educational institutions as opposed to their demands for stability and collaboration (5) core funding and project funding, and (6) formula-based and negotiations-based methods. In addition, there is the question on the implications of all this on the efficiency, quality and equity in the higher education system. Indeed, there is a large literature on how countries go about in addressing these trade-offs and dilemmas and how all that is reflected in their resourcing of higher education (OECD, 2020).

We still know relatively little about the impact of the different types of funding arrangements on the performance of the higher education system—their students, lecturers and researchers. Firstly, because performance (or impact) itself is a multi-dimensional concept (OECD, 2019) and, secondly, because of the wide variety in resourcing approaches that exist and the different contexts in which they are embedded. Finding the best funding system for higher education and getting the incentives right (Canton et al., 2001) is a near impossible endeavor, but learning about the parts of the system that work and the parts that do not is possible, thanks to the accumulation of knowledge through policy evaluations and experiments. And, as so often (for example, in higher education), the process of learning may be more important than the outcome.

Introduction

Across the globe, college and university faculty remuneration is multi-faceted and complex. While the overarching question of this article is “what determines the level of faculty compensation,” a secondary question is “what are the non-monetary aspects in faculty remuneration?” Also included will be the critical aspect of salary involving parity and equity. This entry will use the US model as its framework and provide global comparisons of faculty conditions and compensation.

The remuneration of educators has a long history tracing back to ancient China, where the students of Confucius paid for his instruction with whatever they could afford, perhaps just a scrap of meat (Shen, 2014). Practices of educators deriving income from contributions or honorariums were standard across medieval Europe and elsewhere (Xiaojie, 2017). There is, however, evidence that the practice of awarding salaries to faculty emerged sometime between the 13th and 14th centuries; the amount based on the notoriety and reputation of the scholar (Xiaojie, 2017). The modern faculty compensation systems in colleges and universities have evolved to a complex array.

An important note is that the academic profession competes in a global market. When hiring faculty, universities rarely limit their reach to local citizens. Instead, universities seek a global international faculty to convey quality and worldwide prominence. Hence, while the derivation of faculty salary differs across the globe, there are similarities and patterns to attract an international pool of academics.

Faculty salary levels

Salary is computed differently in many countries and may consist of a complex assortment of basic pay plus bonuses, special allowances, supplements, and subsidies (Altbach et al., 2012). However, with some exceptions, perhaps most visibly in Russia, university faculty are respected and receive a level of compensation to support a middle-class lifestyle. Using the US as an example, the US Bureau of Labor Statistics (US Bureau of Labor Statistics, 2020) reports a postsecondary faculty member's 2019 median annual salary was \$79,540. Significant variations can be seen by the wages at the 10th percentile, \$53,000, compared to that at the 90th percentile, \$164,000 (Payscale, 2021) representing a three-fold difference.

Salary ranges tend to be broad globally. For example, the difference between the lowest entry-level ranks and the very top ranks of the professoriate in China is more than four-fold (Altbach et al., 2012). In Italy, the top rank exceeds the entry-level by a factor of 2.6 (Altbach et al., 2012).

Constituents of faculty salary

This section explains the monetary variations in faculty salaries using the US as the primary example and framework. Although the components are examined individually, it is imperative to understand that faculty salary results from the complex interaction of multiple components.

Institutional control

Compensation levels by control follow prestige. In the US, holding all variables equal, private independent institutions generally provide higher compensation, followed by religiously affiliated, followed by public institutions (AAUP, 2020). In Russia, China, and typically throughout the far East, public institutions are afforded the highest prestige and pay much higher salaries than private or proprietary institutions.

Classification systems

In most countries, there is a hierarchy or system of university and college classification stratified by prestige and research prominence. Typically, research universities occupy the top tier, while 2-year vocational or technical colleges can be found at or near the bottom rungs. With some variation, faculty salaries are highest within the most prestigious institutions. China has a three-tier structure for universities. The top tier is universities in the 985 sector, followed by those in the 221 sector, and lastly by private universities (Ma and Wen, 2012). The classification does not recognize China's vocational and less than 4-year institutions.

In the US, institutions are classified by the Carnegie Classification system. The major divisions are doctoral universities, master's colleges and universities, baccalaureate colleges, baccalaureate/associate's colleges, associate's colleges, special focus institutions, and tribal colleges (Carnegie Classification of Institutions of Higher Education, 2021). While there is no general formula or tiers of salaries assigned to classification, on average, salaries are highest at doctoral universities, followed by master's, baccalaureate, and associates (AAUP, 2020). Tribal colleges provide the lowest average salaries of all Carnegie types (Chronicle of Higher Education, 2019). Some colleges, typically community or Associate level, have their salary structure in line with a step process defined by experience and education.

Rank

Globally, rank has evolved with diverse tiers of different levels and subranks. However, no matter how it is structured, rank remains a potent determinant and driver of academic salary. This is especially true for Norway, a Democratic social society, where the faculty salary structure pays little attention to differences by discipline, research productivity, or even seniority leaving rank as the prime determinant (Kyvik, 2012). In the United Kingdom, the salary structure is complex and defined as a "continuous spine" with 51 points from lecturer to professor as a prime salary predictor (Kitagawa, 2012). Similarly, Saudi Arabian faculty salaries depend heavily on a ranking system consisting of 15 steps per rank, each bringing a salary increase (Al-Ohali and Al-Mehrej, 2012). Rank can carry more than financial implications. For example, failure to achieve promotion from lecturer to associate professor generally means dismissal in China.

In the US, rank is the most potent predictor of salary after discipline differences. Table 1 provides the US average full-time salary by rank (Professor, Associate, Assistant) using 2020–2021 dollars. Within almost all US institutions, holding teaching discipline constant, a professor will be paid more than an associate professor, and an associate professor will be paid more than an assistant professor. Promotion from one rank to another typically includes a sizable raise in salary. Violations of the salary level by rank create an adverse condition referred to as salary compression.

Table 1 Average salary in 2020–2021 by rank by AAUP and Carnegie classification.

<i>AAUP category</i>	<i>Professor</i>	<i>Associate professor</i>	<i>Assistant professor</i>
Doctoral	\$159,919	\$104,482	\$91,408
Master	\$104,389	\$83,958	\$73,492
Baccalaureate	\$107,432	\$82,664	\$69,814
Associate (with rank)	\$91,196	\$75,550	\$64,823

Adapted from AAUP Faculty Compensation Survey Results, Table 1.

Full/part-time status

Regardless of country, full-time faculty are almost always paid significantly more than their part-time counterparts (sometimes referred to as adjuncts). While this comparison may be obvious, it is essential to note that a half-time faculty member will likely be paid much less than one-half of the salary allotted to an equivalent full-time member and will typically not receive any benefits. The use of adjunct, hourly, or part-time faculty may bring economic benefits to a university but struggle for faculty who can only find part-time employment. It is not uncommon for a part-time faculty member to work at several universities or colleges to cobble together a liveable wage. Leading the world in the proportion and use of adjunct faculty, Mexico hires most faculty on an hourly basis; 87% at private institutions and 55% at public institutions ([Maldonado-Maldonado, 2012](#)).

In the US, the AAUP Faculty Survey ([2021](#)) reports that the average amount paid to a part-time faculty member to teach a standard course was \$3556. However, the same report documents the wide range as \$548 to \$47,588. [Table 2](#) provides the average compensation for teaching a standard course by institutional type and control.

Tenure

The award of tenure is widely practiced in the US, Canada, and western Europe but has been recently abandoned in The United Kingdom, Australia, and New Zealand. Some countries, including China, use the terms “tenure” or “tenured professor” as a designation for exemplary performance rather than a protection of academic freedom. The practice of awarding tenure in the US is declining and often meets the public’s displeasure. While many US tenure-providing institutions will grant tenure at the promotion from assistant to associate level, the salary increase is due to higher rank and not the receipt of tenure.

Geographic region within the country

Faculty salaries may differ with respect to the location within a given country. To illustrate, in the US, there is significant institutional variation; however salaries tend to be highest in the New England area, followed by the Pacific, middle Atlantic, south Atlantic, northeast central, southwest Atlantic, northwest Central, southeast central, and Mountain region ([AAUP, 2020](#)). [Table 3](#) provides average salaries by geographic region by rank.

Disciplinary differences

In many countries, faculty salaries depend on the discipline. This is especially true in America, where teaching discipline is one of the most significant determinants of differences in faculty salary. Disciplinary salary differences are highly correlated with salaries in the general workforce. For example, a law professor will be paid significantly more than a professor of elementary education because lawyers earn higher salaries than elementary school teachers outside of academe. The lowest salaries are generally in the disciplines of criminal justice, social work, and education. The highest salaries are usually in law, medicine, engineering, accounting, and economics. [Table 4](#) provides an average salary comparison by discipline using a sample of 10 land grant universities for nine-month tenured and tenure-track faculty for academic year 2019–2020 using data collected through the Association of American Universities Data Exchange (AUDE) and the Oklahoma State University Faculty Salary Survey ([Iowa State University, Office of Institutional Research, 2020](#)). The percentages were calculated using the overall average of all ranks and all disciplines for the peer group to a standard (\$125,715).

Table 2 Average compensation for part-time faculty for a standard course.

	<i>Doctoral</i>	<i>Master's</i>	<i>Baccalaureate</i>	<i>Associate colleges (with ranks)</i>	<i>Associate colleges (without ranks)</i>
Public	\$4134	\$3200	\$3708	\$3019	\$2611
Private	\$5050	\$3473	\$4871	No data	No data
Religiously associated	\$5760	\$3254	\$3108	No data	No data

Table 3 Average salaries for full-time faculty members by geographic region and rank.

<i>Region</i>	<i>Professor</i>	<i>Associate professor</i>	<i>Assistant professor</i>
New the United Kingdom (CT, ME, MA, NH, RI, VT)	\$168,701	\$108,397	\$92,738
Middle Atlantic (NJ, JY, PA)	\$151,297	\$101,063	\$85,602
East North Central (IL, IN, MI, OH, WI)	\$133,217	\$91,938	\$81,602
West North Central (IA, KS, MN, MO, NE, ND, SD)	\$118,196	\$85,743	\$75,682
East South Central (AL, KY, MS, TN)	\$118,736	\$84,896	\$74,182
West South Central (AR, LA, OK, TX)	\$134,720	\$92,494	\$84,076
South Atlantic (DE, DC, FL, GA, MD, NC, PR, SC, VI, VA, WV)	\$134,236	\$93,543	\$84,076
Mountain (AZ, CO, ID, MT, NV, NM, UT, WY)	\$120,066	\$90,300	\$77,301
Pacific (AK, CA, HI, GUM, OR, WA)	\$156,420	\$107,255	\$93,155

Adapted from AAUP Faculty Compensation Survey Results, Table 4.

Table 4 Average faculty salary comparisons of full-time tenure/tenure-tracked faculty by select disciplines for a peer of land grant universities.

	<i>Percentage of the average of all ranks and disciplines and ranks—(\$125,715)</i>
Finance	196.5%
Accounting	177.4%
Marketing	160.0%
Electrical and Computer Engineering	118.8%
Chemistry	112.5%
Aerospace Engineering	109.2%
Political Science	108.0%
Economics	106.4%
Genetics	100.5%
Psychology	99.3%
Civil, Construction, and Environmental Engineering	98.3%
Mathematics	94.0%
History	84.8%
Kinesiology	84.3%
Architecture	80.7%
English	78.2%
Music and Theater	74.2%
Education	72.8%
World languages	70.7%

Institutions: University of California-Davis, University of Illinois- Urbana, Michigan State University, University of Minnesota, North Caroline State University, Ohio State University, Pennsylvania State University, Purdue University, Texas A&M University, University of Wisconsin-Madison.

Union affiliation

Unions and collective bargaining play various roles in the computation of faculty salary globally due to diverse definitions in different countries. In Israel and Australia, salary levels and salary differentiation rely heavily on collective wage bargaining agreements; and much less on discipline or faculty productivity ([Guri-Rosenblit, 2012](#); [Welch, 2012](#)).

In the US, union affiliation is confounded by its prevalence only in public institutions and lower Carnegie levels ([Ehrenberg et al., 2016](#)). Union affiliation is not a dependable predictor of salary level. While some studies have identified a minimal positive effect, others have found no effect or even a negative one.

Bonuses and subsidies

Bonuses take on a multitude of forms. Dutch faculty can count on an end-of-the-year bonus plus a holiday bonus paid in December and May, respectively. Combined, these two bonuses account for 14% of the total faculty compensation ([Jongbloed, 2012](#)).

In China, bottom-line salaries are determined by a complex array of base wages and subsidies. Subsidies can include food and housing and even items such as laundry, telephone, and transportation ([Ma and Wen, 2012](#)). Similarly, in India, the salary of an academic includes components for transportation and house rent ([Jayaram, 2012](#)).

Bonuses can be awarded for any number of reasons including, teaching an extra course, taking on additional students, chairing committees, or anything seen to be above the typical assignment. An administrative stipend may be added to salary in some institutions if the faculty member serves as department chair, faculty leader, or head of an important committee.

Factors for incremental salary increase

In addition to the factors identified, faculty salaries are also subject to cyclic or time-based increases. These salary changes are neither guaranteed nor fixed in amount but rather depend on circumstances and institutional will.

Cost of living adjustments (COLA)

In many countries, there is a process for salary increases with time. It may depend on union negotiation or just governmental policy when academics are civil servants. One of India's five components of academic salaries consists of a "dearness allowance," an amount provided to compensate for inflation (Jayaram, 2012). In Nigeria, faculty salaries are reviewed every three years and can be increased to reflect inflation and remain competitive with other African nations (Bamiro, 2012). In the US, university salary structures generally allow for a cost-of-living adjustment (COLA) that is neither guaranteed nor automatic and available only when the university is in a financial state to afford it. It is not unusual for colleges and universities to entirely forego COLA due to financial concerns. For example, the Coronavirus Pandemic of 2020–2021 produced low enrollments that led to tuition freezes and economic disruption that created hiring freezes, layoffs, and no raises for faculty and staff in many institutions.

Merit, performance, and productivity

Merit raises, or pay for productivity, are not automatic. Many research universities reward faculty productivity, generally defined as publications, patents, international awards, and other scholarly products with salary increases. Merit raises are as much of a retention device as a reward. At the extreme, faculty who have received international recognition like a Nobel Prize or a Pulitzer Award will undoubtedly be rewarded monetarily and sought by other universities. In the US, one of the highest honors is membership to one of the National Academies of Science. In Mexico, the highest national honor is membership in the National System of Researchers (Sandoval-Romero and Larivier, 2020).

Merit is generally calculated through the annual evaluation process conducted at virtually all US colleges and universities. The annual performance process can be very detailed, requiring faculty to fill out detailed evaluation rubrics, assemble a portfolio of annual work, or write descriptive narratives describing their work over the academic year. The evaluation criteria are generally in line with the institutional mission and identify what the institution most values. Hence, research universities will generally award merit increases for scholarly activity (publications, grants, patents, etc.), while institutions that emphasize teaching may provide increases based on teaching evaluations and service. Faculty in the performance, fine, or visual arts will be evaluated on creative activities (exhibitions, recitals, productions, etc.).

Summer compensation

Academic years are calculated differently across the globe. In the US, Canada, and some parts of Europe, faculty are hired on a 9- or 10-month contract and may be able to augment salary through teaching and/or research during the off-contract time (summer). Summer compensation is varied, limited, and defined by university policy across institutions.

During the summer term, compensation for teaching is typically based on the number of courses or credits taught and the faculty member's base salary. In some institutions, the amount per course is based on faculty rank. The maximum allocation is normally one-third of the 9-month base salary.

Faculty may also be able to derive summer compensation through participation in research. Summer research support is often funded through external contracts and grants. In other words, the funder pays the institution to employ the faculty member to perform research as proposed through the provisions of the grant.

Non-monetary compensation (benefits)

Compensation is not solely measured by salary. In comprehending any compensation package, one must consider other aspects often referred to as "benefits." For some faculty, the importance and value of these benefits may far outweigh the salary amount. It is impossible to discuss all of the variations in benefits across the globe. In Mexico, for example, benefits may include food coupons, child care assistance, and even funeral expenses (Maldonado-Maldonado, 2012).

The following sections represent some of the more common benefits but do not represent an exclusive list. Like salary amounts, benefits vary drastically across colleges and universities based on institutional type, control, location, size, collective bargaining unit, status (full time, tenured, etc.), and classification.

Medical insurance

Medical insurance is often tied to employment. In the Czech Republic, health benefits are obligatory and paid to all employees by every employer (Sebkova, 2012). In Nigeria, faculty receive free medical treatments under their National Health Insurance (Bamiro, 2012). In other countries, like Japan, France, and Germany, faculty are considered civil servants and receive health insurance in concert with all other civil servants (Shima, 2012). Even Russia provides faculty health care (Androushchak and Yudkevich, 2012).

In the US, medical insurance is reserved only for full-time faculty and represents a highly sought benefit, especially for faculty with dependents. Although the institution may invite faculty to join the institutional plan, faculty almost always pay a significant portion of the premiums. Packages may include single coverage for the faculty member with options to include immediate family members. The plans may span the options of HMO, PPO, or other structures and may consist of coverage in part for dental, psychological, and or healthy lifestyle programs.

Life insurance

Life insurance is not standard from an international perspective. However, in the US, many colleges and universities will offer faculty a basic term life insurance policy and a long-term disability policy covering the faculty member while employed at the institution. There may be options to upgrade to higher levels of coverage at the faculty member's expense.

Retirement and savings contributions

A pension of some sort is generally awarded to academics in countries where faculty are deemed civil servants. In the US, retirement funds typically allow a faculty member to invest a specified percentage of salary to a tax-deferred account to which the institution will also contribute. These contributions grow tax-deferred and are designed to create a revenue flow post-retirement. According to the latest AAUP report (2020), close to 97% of US full-time faculty have retirement programs with funds contributed in part by their employing institution. However, the options within retirement and savings contributions are highly variable from institution to institution. While some institutions do not offer an option, recent evidence indicates that some institutions are either cutting their contributions or suspending them entirely (Flaherty, 2020). Among public institutions, there may be an option to enroll in a state public employee's system.

Tuition assistance

In many countries, full-time faculty members and sometimes their immediate dependents can enroll in courses at a reduced or free cost. In the US, about one in four institutions will offer tuition waivers (full or part) through a consortium of institutions (AAUP, 2020).

Faculty development support

The area of faculty development is globally broad and diverse. Faculty development may include institutional support (full or partial) to include expenses related to attending a conference in a faculty member's discipline. Or it could be support to attend training on diversity, equity, teaching, or another aspect of faculty responsibilities.

Miscellaneous benefits

Depending greatly on institutional type, other forms of faculty benefits may also be available. Examples include a reduced teaching load, funded graduate assistants, laboratories, and supplies, technology, including computers and other equipment. At onboarding, relocation expenses may be offered.

The full spectrum of academic remuneration

Faculty remuneration is as varied as the institutions themselves. There are also other and diverse ways that faculty salaries may be fixed and/or augmented.

Negotiation

In countries where salaries are not fixed by law, negotiations are an essential part of salary level. It is important to note that the starting salary accepted by a new faculty member affects the level of remuneration for as long as that faculty member remains employed by the institution and beyond. In some countries, retirement benefits rely on the salary earned. Typically merit and COLA increases are calculated as a percentage of the base salary, and if the base wage starts low, it will likely remain so. However,

in countries where negotiations are possible, offers can and probably should be negotiated. Moreover, it is not only salary level, but also other benefits that may be negotiated including, but not limited to, start-up funds, conference-travel expenses, moving expenses, and even a position for a spouse or partner (Kelsky, 2014).

Augmenting salary by non-conventional tactics

Some faculty members dissatisfied with their remuneration seek relief by seeking a position or an offer from another institution. In the US, it is not uncommon for a faculty member to get an offer from another college/university that includes a better compensation package. When the offer is revealed to the current institution, it may trigger a retention offer that matches or exceeds the offer. A word of caution here, some faculty members have unsuccessfully pursued the “competing offer” for the sole purpose of getting the offer matched at their current institution without sincere intention to accept it. This tactic has been known to backfire when the current institution bids a warm farewell rather than the desired retention package.

Moonlighting

Although technically not a part of faculty salary, moonlighting or adding part-time work elsewhere is commonplace and even expected in some countries. It is essential to augment low faculty salaries in Russia as low academic wages are insufficient to support the academic and family. In China, India, and Nigeria, it is common for faculty to add teaching an evening class at a private college (Bamiro, 2012; Ma and Wen, 2012).

Salary parity, discrimination, and equity

Unfortunately, disparities regarding pay parity and discrimination in the workplace exist in virtually all industries; and academia is no exception. In the US, wage discrimination based on gender, race, sexual orientation, age, or disability is prohibited under the Equal Pay Act, Title VII, The Americans with Disabilities Act, and the Age Discrimination in Employment Act. Faculty members who identify discrimination or can make a case that others with similar qualifications and experience receive higher compensation may begin with a discussion with their department chair and/or Dean to request investigation and possible adjustment. There have been many documented cases of discrimination and subsequent settlements involving faculty remuneration. For example, a 2018 case involving the University of Denver resulted in an order to pay a \$2.6 million settlement to seven female law professors who proved that they were being paid less than their male counterparts (Flaherty, 2018).

Salary differentials by gender

Holding all other variables constant, on average, female faculty earn less than their male counterparts worldwide. Of course, gender gaps vary widely by country. In Europe, the gender gap is especially wide in Estonia, the Czech Republic, Israel, and Portugal, reaching levels as high as 35% (European Commission, 2007). In Canada, a country that aggressively addresses discrimination, gender gaps were identified in all but three of its large research institutions, the greatest being more than 15% (Cummings, 2020). Although high-rank female representation within elite university faculties is below parity, Australia boasts small gender pay gaps due to union-negotiated agreements (Bailey et al., 2016). However, Bailey et al. point out that Australian base salary comparisons mask gender differentials due to the widespread use of bonuses (2016).

Specific faculty gender gaps in China, Japan, Korea, and India are not routinely published, but the broad evidence suggests that gender gaps exist and are likely comprehensive.

Studies of salary parity by gender for college and university faculty, specific to the US, date back to the early 1970s. Hagedorn (1996, 1998), using data from the 1989 Carnegie Foundation for the Advancement of Teaching national survey of faculty, reported a mean differential of \$8840, which decreased to \$2456 after applying a method to isolate only discriminatory differences. Barbezat and Hughes (2005), using national data from 1999, reported males earning 20.7% more than females with a parity gap of between 17% and 23% depending on the decomposition process used. Table 5 provides salary data from AAUP's most current study (2020).

Table 5 Average salary for full-time men and women (all AAUP/Carnegie categories combined) 2020–21.

Rank	Male average salary	Female average salary
Professor	\$147,042	\$127,819
Associate	\$98,995	\$92,208
Assistant	\$87,530	\$79,621
Instructor	\$65,544	\$61,034
Lecturer	\$69,857	\$64,187
No rank	\$78,340	\$69,828

Adapted from AAUP Faculty Compensation Survey Results Table 3.

In addition to the differentials, the AAUP also reports that female faculty have less security (2020). In addition, numerous universities have performed internal analyses, with many finding some evidence of inequities by gender.

Acker (1989, 1990, 2006) identifies universities as gendered organizations that manifest an uneven distribution of power and position, rendering males more powerful and entitled. Studying science and engineering, Johnson and Taylor (2019) identified one of the major culprits to gender salary inequity as “masculine norms and male majority” (p. 21). They used data from the National Science Foundation, the NSF Survey of Earned Doctorates, and the Integrated Postsecondary Data Systems (IPEDS) to find a gender gap at all ranks averaging \$5211 (2019).

Salary differentials by race

Many countries have a relatively homogeneous faculty population regarding race, leaving racial differences in compensation unstudied. However, based on the significant evidence of racial salary gaps in most professions in multi-racial countries, such as the United Kingdom, Australia, and the US, it is safe to assume that differences by race extend to academe. South Africa, a country where academic compensation is exceptionally high, presents a picture of racial differentials that present less directly than a comparison of White and non-White faculty salaries. Although apartheid has been outlawed, colleges and universities previously designated for Black students remain underfunded. These universities cannot compete in the hiring nor compensating of star faculty (Sehoole, 2012).

For a more detailed look at racial differences, we delve into the conditions in the U.S. Discrimination by race is less evident by salary amount than by representation. Simply stated, people of color are underrepresented in academia. Only 22% of all full-time faculty are people of color; a percentage that declines if disaggregated by rank or administrative duty. Only 16% of department chairs are people of color (Sziron, 2020). However, when analyzing the wages paid to faculty of color, the picture is not simple. Unfortunately, the U.S. Department of Education (IPEDS) does not collect salary data disaggregated by race or gender. An excellent project by Li and Koedel (2017) analyzed data from 40 selective public universities using a regression approach. After controlling for university effects, field effects, the prestige of Ph.D. granting institution, experience, and faculty h-index, a negative wage gap remained only for Asian faculty (\$−1409.96). Black and Hispanic faculty had small but positive wage gaps of \$3316.14 and \$1201.72, respectively. However, these small differences were explained by further analyses controlling for academic field, experience, and research productivity, thus concluding that there is neither evidence of wage discrimination nor wage premiums for faculty of color. Interpretation is that for those faculty of color who have navigated to faculty positions, there may not be a wage gap. However, one must remember that the controls used in Li and Koedel’s research could not uncover discrimination or bias in promotions or barriers within the structures of academic disciplines.

To better understand faculty salary by race/ethnicity in the absence of national data requires reliance on individual university or university systems. Following are four large and representative studies that are typical of the type run by universities.

- The University of Arizona conducted a comprehensive study of base salary for tenured and tenure-eligible faculty and reported no systemic disparities by gender, race or ethnicity (Arizona Board of Regents, 2021). A subsequent review at the unit level did reveal “correctable salary variations,” which were addressed.
- UCLA’s Faculty Equity Report of July 2020, analyzing 2018–19 data across four university units, reported lower salaries for under-represented minority (URM) faculty compared to their White counterparts. After controlling for a set of variables, the report concluded that race differentials were no longer statistically significant (UCLA Office of the Executive Vice Chancellor and Provost, 2020).
- The University of Oregon hired outside consultants to investigate salary inequities by gender and race. The report concluded that no protected group was systematically receiving lower than predicted salaries (Berkeley Research Group, 2019).
- The University of North Carolina reported that URM faculty were less likely to be tenured and more likely to rank below professor than their White counterparts. However, after controlling for the usual variables, reported no statistical salary differences (Office of Institutional Research & Assessment of the University of North Carolina at Chapel Hill, 2017).

In conclusion, universities report few or no statistically significant differences by race or ethnicity, based on available institutional data. However, inequities do exist when viewing the number of faculty of people of color. Moreover, there is also evidence that race may play an inappropriate role in promotions of rank and the granting of tenure.

Faculty compensation around the globe

It is an accepted fact that the strength and prosperity of a nation rely on an educated citizenry where universities play a dominant role. It follows, therefore, that the quality of the university lies squarely on the qualifications and quality of the faculty it employs. Many countries are experiencing an increase in students seeking postsecondary degrees and credentials, thus promoting growth. Moreover, a positive step to becoming an internationally respected university requires attracting an international faculty.

Realistically speaking, university structure and remuneration vary vastly from country to country and are difficult to impossible to compare directly. However, to get a general idea of the level of compensation provided to faculty, I provide a comparison using the US as the standard and convert all salaries to U.S. dollars. Table 6 provides the annual mean salaries of a university professor in

Table 6 International average salaries (local and USD currencies) of university professors and cost of living.

	Country	Mean annual base salary in local currency	Mean salary in \$(USD)	Cost of living index
North America	Canada	108,183 (CAD)	\$89,586.34	70.08
	Mexico	393,849 (MXN)	\$19,727.90	35.05
	USA	104,716 (USD)	\$104,716.00	71.92
Central America	Costa Rica	18,540,650 (CRC)	\$29,850.45	50.64
	Guatemala	399,186 (GTQ)	\$18,137.82	44.76
South America	Argentina	1,100,112 (ARS)	\$11,606.18	37.87
	Brazil	132,879 (BRL)	\$26,323.33	31.82
	Chile	26,257,047 (CLP)	\$36,523.55	49.33
	Peru	56,176 (PEN)	\$14,628.23	36.26
Europe	France	60,457 (EUR)	\$73,564.08	80.62
	Germany	75,037 (EUR)	\$91,305.02	70.62
	Italy	56,446 (EUR)	\$68,683.49	73.11
	Poland	139,284 (PLN)	\$37,996.68	42.04
	Spain	47,754 (EUR)	\$58,107.07	59.09
Asia	China	275,109 (CNY)	\$42,999.54	42.54
	India	9,48,017 (INR)	\$13,006.79	25.16
	Indonesia	350,891,733 (IDR)	\$24,537.86	37.44
	Japan	9,552,467 (JPY)	\$87,194.92	87.77
	South Korea	55,336,184 (KRW)	\$49,835.77	81.2
	Pakistan	2,045,493 (PKR)	\$13,111.61	21.59
	Vietnam	483,390,908 (VND)	\$20,969.50	38.05
Mideast	Egypt	192,897 (EGP)	\$12,254.75	30.1
	Iraq	33,459,296 (IQD)	\$22,916.27	32.72
	Israel	227,077 (ILS)	\$69,803.47	86.63
	Saudi Arabia	196,736 (SAR)	\$52,449.82	49.95
	Turkey	105,529 (TRY)	\$12,156.94	31.48
	Russia	1,115,433 (RUB)	\$15,292.59	33.17
Scandinavia	Denmark	572,347 (DKK)	\$93,635.97	91.67
	Finland	70,348 (EUR)	\$85,606.48	77.46
	Iceland	10,517,856 (ISK)	\$86,909.04	96.77
	Norway	776,707 (NOK)	\$93,515.52	106.09
	Sweden	566,762 (SEK)	\$68,521.53	79.17
Oceania	Australia	125,591 (AUD)	\$97,219.99	84.14
	New Zealand	114,819 (NZD)	\$82,738.57	79.14
Africa	South Africa	664,086 (ZAR)	\$49,427.92	41.69
United Kingdom	The United Kingdom	51,884 (GBP)	\$73,504.06	71.03
	Scotland	50,467 (GBP)	\$71,496.60	71.03

37 countries. Like all averages, these numbers mask significant differences in regions and institutional types. As reported by Salary Expert, these annual averages are powered by the Economic Research Institute ([Economic Research Institute, 2021](#)). Conversions to USD were done through Google and reflect the conversion rates on June 6, 2021. Notably, the highest salary is paid in the US. To further provide context, [Table 6](#) also includes a cost-of-living indicator as recorded for 2021 by Numbeo ([Salary Expert, 2021](#)). These indices are calculated relative to New York City, receiving an index of 100. A broad interpretation can be understood from taking the example of Argentina, which is the lowest salary in the chart (\$11,606.18) but is in an environment where the cost of living is only 38% of that of New York City. Mathematically, this salary would equate to earning \$30,542.58 while living in New York.

Conclusions

Some countries do not extend autonomy to assign faculty salaries to the institutions; instead, colleges and universities must adhere to federal regulations. In most aspects of faculty salary and benefits, there is wide variation both inter and intra-country. Rank and its relation, longevity, are strong predictors across the globe. While merit is a predictor of salary in many locales, it is not universal.

The faculty salary structures reflect national and institutional values. It is not by accident that education faculty will typically earn less than business faculty. Nor is it by chance that female faculty salaries on average are less than their male counterparts. Moreover, salary differences by discipline may reflect profound cultural devaluation of women through inequitable salaries for faculty in fields predominantly female such as education, social work, and consumer sciences ([Bellas, 1994](#)). Universities are microcosms of the countries in which they reside and reflect both the positives and the negatives cultural norms.

Discrimination is devious and can escape scrutiny controlling for the salary building blocks. For example, faculty salary studies controlling for a long list of variables, including rank, mask any discriminatory practices in awarding rank.

This discussion of academic compensation did not include the costs and investment in time as well as opportunity costs by the faculty themselves. To be an academic requires extensive graduate education, most often culminating with a Ph.D. or equivalent. Many faculty had to rely on student loans to pay for their education and must pay these loans back over many years with interest. After receipt of the terminal degree, some future faculty must first accept a very low-paying post-doc position for a year or more in preparation for the actual role of faculty. While a faculty member's job certainly has its advantages, many faculty could quickly point out the disadvantages as well. Most faculty work long hours and balance high expectations in teaching, research, and service. Disentangling the sacrifices and expenses alongside the benefits was not a question considered in this article. However, in most parts of the world, those who have persevered and have achieved a high academic rank are compensated relatively well compared to their country's average compensations.

The expanding and changing role of international higher education in international relations

International higher education (IHE) has a long and rich history in relation to its contribution to relations between and among countries. But in today's more complex, interdependent and globalized world there are new rationales, opportunities, benefits and risks attached to the role and contribution of higher education and research to international relations. Examining the role of IHE in building relations between and among countries is not new. However, using a knowledge diplomacy framework for analysis rather than the traditional lens of cultural diplomacy and soft power is new.

The purpose of this discussion is to promote a greater awareness and understanding of the role and dimensions of knowledge diplomacy. The first section examines the importance of studying the role of higher education in international relations followed by a discussion on defining knowledge diplomacy and clarifying the fundamental differences between cultural diplomacy, science diplomacy, soft power and knowledge diplomacy. The next section identifies and examines eight primary characteristics of knowledge diplomacy which leads to brief summaries of some case studies which demonstrate knowledge diplomacy in action. The examples of knowledge diplomacy focus on how through cooperation, reciprocity and mutuality of benefits international higher education can strengthen relations between and among countries to address current global issues using international higher education, research and innovation (IHERI) as key strategies. The last section identifies some issues and challenges which need to be addressed as knowledge diplomacy becomes better understood, researched and operationalized.

Four concepts form the backbone of this analysis of knowledge diplomacy. They are higher education, research, innovation and international relations. It is important to explain how these concepts are used as they are not formal scholarly definitions per se but are more descriptive and aim to orient the reader as to how they are used.

- Higher education refers to the processes of teaching and learning whether it be in a formal or informal manner using a broad range of strategies. Training is included
- Research includes the gathering of information on a subject, investigation, or experimentation aimed at producing new knowledge
- Innovation refers to the application of research findings and new knowledge to produce change or new ideas
- International relations refers to the bilateral or multi-lateral relations between and among countries
- Knowledge, in the term knowledge diplomacy, is used in a representational and inclusive sense not literally. It refers to the combination of higher education, research and innovation

Toward a working definition of knowledge diplomacy

Diplomacy has a very long history. As a result, there are a myriad of interpretations of diplomacy. Many scholars and professionals believe that there is not one universally accepted definition of diplomacy as it is often defined in terms of issues, interests, approaches and strategies used. But the concept most fundamental to diplomacy and most frequently cited is the “the management of relations between and among countries” (Kerr and Wiseman, 2013).

The traditional way of understanding diplomacy focuses on the role of the government, usually the Department of Foreign Affairs and their representatives in embassies around the world. Primary tasks included representation of the country’s interests, negotiation of agreements and treaties, as well as mediation of conflict (Pigman, 2010). There is no question that projection and protection of self-interests are front and center, but diplomacy concentrates on finding solutions through negotiation, mediation and compromise. Security and economic development have been the central issues in traditional diplomacy and still are. But, during the last three decades, diplomacy has changed significantly (Bjola and Kornprobst, 2013).

In contemporary diplomacy, there are a broader set of actors, a greater set of issues and challenges to be addressed, as well as new approaches and strategies being used. It is no longer only the government and their representatives who are seen as the major agents, there are a diversity of new actors including civil society, multinationals and government departments other than foreign affairs (Cooper et al., 2013). Theme-based diplomacies such as health, environmental, trade, refugee diplomacy have grown in importance. New approaches and instruments such as track-two, digital, summit and public diplomacy are being used.

Knowledge diplomacy is one of the new types of diplomacy emerging in contemporary times. An early interpretation of the term related to the negotiation of intellectual and property rights by the World Trade Organization members (Ryan, 1998). However, defining knowledge diplomacy in relation to intellectual property rights in trade agreements was a very narrow and a short-lived approach. A more recent conceptualization of knowledge diplomacy has broadened the focus to “the role of international higher education, research and innovation (IHERI) in building/strengthening relations between and among countries” (Knight, 2022). This acknowledges the growing importance of higher education in the more inter-connected and interdependent world in which we live and how it contributes to international relations and the challenges inherent in addressing current global issues.

Knowledge diplomacy can be understood as a two-way process as depicted in Fig. 1. Knowledge diplomacy includes the role of international higher education, research and innovation (IHERI) in managing and strengthening international relations (IR) AND conversely, the role of international relations in enhancing international higher education, research and innovation. The focus of this discussion is on the role of IHERI in managing and strengthening international relations.

Important to note is that Knight’s proposed working definition of knowledge diplomacy does not include or delineate the actors, rationales, strategies, and outcomes. These aspects are deliberately not included because they can differ dramatically according to the issues being addressed, the strategies being used, and the primary actors and countries involved. Furthermore, it must be recognized that this definition is not neutral as it infers a positive outcome. While the intention is to strengthen international relations as well as enhance international higher education, research and innovation, there can be unexpected negative outcomes depending on the issues and actors. This is the nature of international relations.

Fig. 1 Knowledge diplomacy as a two way process.

Why study knowledge diplomacy

Why study knowledge diplomacy is a complex question which begs a far more comprehensive analysis than this discussion can provide. However, there are a number of current issues and critical developments which necessitate a deeper understanding of the two way relationship between higher education, research and innovation and international relations. These include:

- The number of world issues, some call them crises, which cannot be solved by one nation alone. A bilateral or multilateral approach is imperative for addressing issues and threats such as climate change, epidemics, refugees and migration, water, food security, biodiversity
- The evolution of diplomacy such that contemporary diplomacy includes new actors, new strategies, new issue based diplomacies and new approaches
- The changing landscape of international higher education. In addition to the traditional elements of IHE such as student/scholar mobility, joint research projects and institutional agreements, there are new development such as knowledge hubs, international joint universities, regionalization of higher education and policies, and transformation of university networks into regional universities.
- The escalation of national public/private partnerships between universities and industry to the international and regional levels.
- The growing interdependence and interconnectivity among nations in spite of more recent threats of growing nationalism
- The increasing importance and emphasis on the knowledge society as a broader concept than knowledge economy
- The combination of soft power (attraction and persuasion) with hard power (military and economic sanctions) into smart power.
- The need for reliable research, verifiable evidence and knowledge sharing in the emerging “post-truth era.”

Differentiating knowledge diplomacy from cultural, science, education diplomacy

Misconceptions about knowledge diplomacy

Knowledge diplomacy presents a new approach to exploring the relationship between IHERI and international relations. As such the term is interpreted and used in a variety of ways as it becomes part of the higher education and international relations discourse. Knowledge diplomacy is being used interchangeably and confused with terms such as soft power, cultural and science diplomacy (Knight, 2015). There are instances where knowledge diplomacy has been inappropriately described as a way to lobby for more national and regional government funding for IHE. The term knowledge diplomacy has also been incorrectly used as a synonym for the commercialization of IHERI in the knowledge economy.

Important to understand is that knowledge diplomacy is a more comprehensive process than individual traditional higher education internationalization activities and that it is different from soft power and other forms of diplomacy such as cultural, science and education diplomacy. Understanding the difference among these different terms involves analyzing two aspects. The first is understanding inherent values attached to the different approaches and secondly analyzing the nature of the strategies and activities.

Knowledge diplomacy is broader than cultural diplomacy

Cultural diplomacy has been a popular term for decades. While the meaning and activities have evolved it is primarily oriented to international exchanges, exhibitions and events in all fields of the arts, music, theater, literature, film, media, architecture as well as sports and other cultural expressions (Goff, 2013). The goal of cultural diplomacy is primarily to enhance cross-cultural awareness, trust and relations between and among countries (Gienow-Hecht and Donfried, 2010). When higher education is referred to as part of cultural diplomacy the most common activities cited are student/scholar exchanges; language learning, international sports/debating/competitions; and cultural events (Pajtinka, 2015). While cultural diplomacy can include a wide range of people-to-people education and cultural exchanges, it typically is not seen as being broad enough to include all the central elements of higher education particularly those involved in scientific research and subsequent innovations. Furthermore, the emphasis is primarily on people mobility and the recent increase in the scope and scale of universities and other higher education providers moving across borders to offer foreign education programs and qualifications in the students’ home country has to date, not been accommodated in the notion of cultural diplomacy (Knight, 2016a).

Knowledge diplomacy is inclusive of science diplomacy but more comprehensive

The increasing importance of science diplomacy as evidenced in both national government science policies and international summits begs the question as to whether science and knowledge diplomacy are not one in the same. This is a question worthy of consideration and depends on how broadly science is being defined and used. If science is broadly interpreted to mean knowledge then there is a close relationship. But, traditionally science diplomacy has been seen in terms of hard sciences and more recently it has been placed within the broader framework of science, technology and innovation (Miremadi, 2016). There is no doubt that this reflects the centrality of science and technology in today’s knowledge economy. However, the focus on science and technology excludes, to a large extent, other sectors, issues and disciplines related to the social sciences and humanities. For instance, it is highly unlikely that science diplomacy initiatives or negotiations would include issues such as refugee, gender, poverty or human rights initiatives. Thus, while full acknowledgment is given to the importance and role of science diplomacy it does not rule out the necessity of the process of knowledge diplomacy which is a more inclusive concept in terms of education and the production and application of knowledge.

Why not use the term education diplomacy?

The term education diplomacy is usually applied to basic education and is linked closely to advocacy. The Association for Childhood Education International has adopted this term and believes that “education diplomacy uses the skills of diplomacy grounded in human rights principles to advance education as a driver for human development” (Hone, 2016). This raises the question as to whether the term education diplomacy or knowledge diplomacy is more appropriate for higher education. It is a question worthy of consideration. In addition to education and training, knowledge diplomacy includes research and the use of research and new knowledge for innovation, two areas not usually associated with basic education. Furthermore, the drivers and outcomes differ. Education diplomacy is oriented to human development while knowledge diplomacy has a broader mandate and in many cases focuses on addressing and solving common global issues which face countries in all regions of the world.

Knowledge diplomacy is different from soft power

In the mid-nineties the term “soft power” was introduced as a distinct and viable alternative to hard power. Soft power was described as “the ability to influence others and achieve national self-interests through attraction and persuasion” (Nye, 2004). It is different than hard power which uses coercion through military force and economic sanctions to achieve national interests. The concept of smart power emerged later (Nye, 2009) and is a calibrated combination of soft and hard power strategies to achieve a country’s goals. The latest term in the ever-changing lexicon is sharp power. This term was first introduced by Walker and Ludwig (2017) as the use of manipulative diplomatic policies by one country to influence the political system of a target country. A fuller description of sharp power suggests that it uses aggressive and subversive policies by authoritarian governments as a projection of state interests in democratic countries (Walker, 2018).

Fascination with the term soft power resulted in its application to many sectors and types of bilateral/multilateral relationships. Higher education was no exception. The debate and articles about higher education as an instrument of soft power sky rocketed in the early 2000s-especially from Asia (Li, 2018). Even long standing collaborative academic programs, capacity building and development projects were framed as soft power initiatives. International higher education was solidly positioned as part of the competitiveness and power agenda (Wojciuk, 2018). The popularized term of soft power was used to inappropriately describe higher education partnerships as being about competitiveness, dominance and a power dynamic (Nye, 2005) while in reality many were rooted in the notion of cooperation, reciprocity and mutuality of benefits.

In many ways, the term knowledge diplomacy emerged as a counter balance or alternative to soft power. Important to point out is that while some international higher education initiatives may be based on competitiveness and dominance and are correctly labeled as soft power (Chou and Spangler, 2018); not all are. It is imperative that the difference between the role of IHERI in a knowledge diplomacy approach to international relations is distinguished between the role of IHERI in a soft power approach.

A soft power approach juxtaposed to a diplomatic approach

While both soft power and knowledge diplomacy initiatives exist in higher education they differ significantly according to factors such as intentions, nature of relationships, strategies and underlying values. In short there is a difference between a soft power approach and a diplomatic approach as illustrated in Table 1. This section discusses the main attributes of soft power and diplomatic frameworks. Hard power, which is predicated on the use of military force or sanctions is not usually used in higher education although there are major implications for higher education when it is applied to a conflict situation between countries.

Table 1 A Soft Power Approach juxtaposed to a Diplomatic Approach.

	<i>Soft power approach</i>	<i>Diplomatic approach</i>
Self-interest	National self-interests dominate at the expense of others	National self-interests leading to mutual benefits
Modes	Attraction Persuasion Compliance Domination	Negotiation Mediation Communication Conflict resolution Conciliation Collaboration
Values	Authoritarianism Competition Cooption	Reciprocity Mutuality Common ground
Outcomes	Win -lose Zero-sum game	Win-win with mutual but different benefits
Nature of relationships	Vertical Top down	Horizontal Collaborative

- *Approach* - The common motivations behind soft power include self-interest, influence and dominance and thus a vertical or top-down approach is used to achieve desired outcomes. With diplomacy the intentions are closely linked to addressing self-interests and common issues in a collaborative fashion ensuring that there are benefits, albeit different benefits, for all partners. National self-interests are still at play, it would be naïve to deny this, but a more horizontal type relationship exists among partners/actors in diplomacy.
- *Strategies*- in a soft power approach, attraction and persuasion leading to compliance are the primary strategies used whereas diplomatic strategies are usually characterized as negotiation, communication, conciliation, cooperation and mediation thus supporting the collaborative horizontal approach.
- *Values*- the values underpinning a soft power paradigm are domination, authoritarianism, and competition to achieve national goals and self-interests. These differ significantly from diplomacy which builds on values of reciprocity, mutuality, and compromise to meet the different needs and interests of partners toward reaching a common end while still recognizing the centrality of national self-interests which differ among countries.
- *Outcomes*- in terms of outcomes the soft power approach is often characterized as one-sided in terms of benefits as opposed to a diplomatic approach which tries to achieve a win-win outcome with mutual but different benefits for all major players.

Thus, a soft power approach versus a diplomatic approach in international higher education, research and innovative is based on fundamentally different motives, modes, values, and outcomes. In the next section knowledge diplomacy is analyzed using the diplomatic framework. The characteristics or key elements of knowledge diplomacy are discussed at both a conceptual and pragmatic level.

Key characteristics of knowledge diplomacy

An important aspect of defining and understanding knowledge diplomacy is the identification of the fundamental or common characteristics. These include guiding values or principles, different ways of interacting, types of relationships and activities among the range of actors, and the spectrum of benefits and outcomes. The following list of eight characteristics identifies important and strategic dimensions of knowledge diplomacy and aligns closely with the diplomatic framework described above.

Diversity of Actors and Partners

In knowledge diplomacy a diversity of actors is actively engaged in collaborative research, knowledge production, training, and innovation projects. While universities and colleges are key players there is usually a range of other higher education actors involved. These include national, regional or international centers of excellence, research institutions, private and public foundations, think tanks, professional associations, non-governmental organization related to education, and governmental departments/agencies at all levels. In the majority of cases the higher education actors are also working with other sectors and/or disciplines depending on the nature of the initiative. Common partners include industry, civil society groups, foundations, governmental agencies. Higher education actors working together with other sector partners is a key feature of knowledge diplomacy and often differentiates knowledge diplomacy from higher education internationalization.

Focus on Higher education, research and innovation

Knowledge diplomacy builds on the fundamental functions of higher education (teaching/learning, research, knowledge production and innovation, and service to society). Normally, the process of knowledge diplomacy involves multiple forms of IHERI as dictated by the nature and complexity of the issue being addressed. Individual IHE activities (i.e., student mobility, scholar exchange, joint conference) are part of the larger networked series of activities involving multiple actors and strategies but as stand-alone activities they normally do not constitute knowledge diplomacy. As stand alone activities they are more accurately described as internationalization strategies and while they have multiple benefits they are not specifically designed to contribute to sustainable international relations between countries although that can be a by-product.

Recognition of different needs and collective use of resources of actors

Because knowledge diplomacy brings together a network of different partners from various sectors to address common global issues there will be different rationales and implications for the individual countries and actors involved. This means that actors will bring different needs, priorities and resources to the partnership. These differences will need to be respected and negotiated to ensure that the strengths and opportunities for each partner are optimized. This is done through a horizontal collaborative type of relationship that acknowledges the different but collective needs and resources of the group of partners. Leadership is critical but not in the form of dominance, authoritarianism or compliance as in a soft power relationship.

Reciprocity -mutual but different benefits

Different needs and resources of actors will result in different benefits (and potential risks) for partners. Mutuality of benefits does not mean that all actors/countries will receive the same benefits. It does mean, however that the principle of mutuality and reciprocity of benefits will guide the process and there will be collective and different benefits accrued for different actors and countries.

Based on negotiation, collaboration, cooperation

Knowledge diplomacy is based on horizontal relationships between and among major actors and countries and focuses on cooperation, collaboration, negotiation and compromise to ensure that the overall goals are met and there are benefits for all. This is founded on a win-win approach which is fundamental to knowledge diplomacy and as noted in table one differs from soft power.

Different levels of collaboration

Knowledge diplomacy includes different levels of bilateral and multi-lateral cooperation at regional and international levels.

Commonality of issues – addressing regional and global issues

It is acknowledged that there may be varied motivations driving knowledge diplomacy. However, addressing common issues, as well as specific national interests, requires cooperation among higher education actors and other partners from different countries. This necessitates an agenda which highlights common issues and concerns among countries who believe that a collaborative and co-ordinated effort will lead to results that could not be achieved by one country alone. As discussed, while the issues of concern will be common the different needs, priorities, resources, benefits and implication may vary among actors and countries. Succinctly put, it means that the “whole is greater than the sum of the parts” but that each part brings different strengths and may receive different benefits.

Build and strengthen relations between and among countries

Central to the notion of knowledge diplomacy is that the cooperation among the different actors and partners depends on and further strengthens positive and productive relations between and among countries. This builds on but goes beyond the contribution that bilateral and multi-lateral agreements between higher education institutions make. Clearly, there is a sliding scale with regards to the breadth and depth of contributions that knowledge diplomacy can make to relations between and among countries but working to address pressing global issues that impact each and every country is an important way forward.

Important to emphasize is that these knowledge diplomacy characteristics can overlap with different types of internationalization activities, but it is a mistake to suggest that the processes of internationalization and knowledge diplomacy are the same. Knowledge diplomacy is clearly oriented to strengthening relations between and among countries and uses IHERI activities as a means to this end. However, a commonly accepted definition of higher education internationalization “the process of integrating international, intercultural and global perspectives into the primary functions (teaching/learning, research and service to society) and delivery of higher education institutions and systems” (Knight, 2016b) has a narrower and more academic focus.

Examples of knowledge diplomacy initiatives

The collaborative knowledge diplomacy approach is being explored as an alternative to a more one-sided soft power approach. It is interesting and helpful to look at some contemporary projects that exhibit key characteristics of knowledge diplomacy. These examples of knowledge diplomacy have been chosen with the following factors in mind:

- come from all regions of the world,
- include bilateral and multilateral initiatives,
- address a variety of global issues,
- involve HEIs as key participants among a broader group of actors and sectors
- represent long term successful projects and newer initiatives,
- include all aspects of higher education in terms of teaching/learning, research and innovation, and service to society.
- contribute to the building and strengthening of relations between and among countries of the world

These initiatives were carefully chosen to illustrate that knowledge diplomacy includes but goes far beyond typical international higher education activities such as student/scholar mobility, joint research projects and conferences.

The Pan African University. The African Union in cooperation with other African and international organizations has created five different research institutes each dedicated to research and teaching in a specific set of disciplines and are located in five different regions of the continent. The research institutes are: (1) Basic Sciences, Technology and Innovation located at Jomo Kenyatta University of Agriculture and Technology in Kenya; (2) Life and Earth Sciences, including Health and Agriculture, located at University of

Ibadan Nigeria; (3) Governance, Humanities and Social Sciences located at University of Yaoundé II in Cameroon; (4) Water and Energy Sciences located at the Abou Bakr University of Tlemcen in Algeria; (5) Space Sciences Institute located at Cape Peninsula University of Technology in South Africa which is still under development. Each institute provides graduate programs and serves as a network hub for research collaboration with other universities and research partners (industry, government, NGOs) in the region. It is a multi-lateral knowledge diplomacy initiative where IHERI serves to strengthen African regionalization and where collaboration among countries and actors in the continent serves to advance IHERI. <https://pau-au.africa/>

Humanitarian Relief Initiatives. Brown University from the USA works bilaterally with countries in the Global South to promote more research and training on humanitarian aid. It is at the cutting edge of working in local settings to create and distribute new knowledge to serve better policy making and management practices in disaster management at both the community and national levels. This knowledge diplomacy initiative addresses a critical global issue by working collaboratively with local and national universities, governments, and industry in host countries while training young academics both at Brown and beyond to undertake research with multiple disciplines and sectors on this critical issue. <https://watson.brown.edu/biari/about/history>.

Women and Gender Research Institute. Located at Granada University in Spain but closely networked with other universities, research centers and NGOs across Europe and beyond, this research institute and related graduate programs put women and gender issues at the center of interdisciplinary research, policy development, and training of new scholars. It is a self-funded multi-lateral knowledge diplomacy project which has developed over a couple of decades and demonstrates how cooperating with other higher education and NGO partners nationally, regionally and internationally serves to advance research, knowledge exchange and advocacy on this critical issue. In addition, it demonstrates how IHERI is effective in building closer relationships within Europe to advance the regionalization agenda. https://www.ugr.university/pages/research_innovation_transfer/research_institutes_centres/the_institute_of_womens_and_gender_studies.

International Joint Universities (IJU) - the German-Jordanian University. The establishment of internationally co-founded and developed joint universities by two or more institutions/countries is a fascinating development which contributes to strengthening IHERI as well as bilateral relations between countries. As of 2021, there are 22 operating around the world with several others in the planning stage. The German-Jordanian University, established in 2005, exemplifies how the strategic use of joint academic programs and collaborative research between academics and industry in both countries yields benefits for all, and how student and scholarly exchanges builds closer cultural and scientific relationships between the two countries. <http://www.gju.edu.jo/>

ZIKA Rapid Response Project. The outbreak of the Zika virus in Brazil and the threat of it spreading to other countries resulted in a collaborative research project that originally involved researchers from Brazil and the UK but soon included universities and research centers from around the world. The urgency for research on treatment and prevention of Zika resulted in an abbreviated time period between the application and awarding of the funding by three funding agencies in Britain and a foundation in Brazil. While this knowledge diplomacy project is primarily oriented to research it illustrates the importance of collaboration between expert researchers and the advantages of involving different sectors and disciplines to undertake the research and share the new knowledge. <https://webarchive.nationalarchives.gov.uk/20200923143229/https://mrc.ukri.org/funding/browse/zika-rapid-response-initiative-parent/zika-rapid-response-initiative/>.

Australia-India Research Fund: Since 2006, the Australia-India Strategic Research Fund (AISRF) has strengthened relations between Australia and India by supporting scientific research that are jointly undertaken by researchers from both the public and private sectors in both Australia and India. Studies must address mutual priority areas for the two nations such as: agriculture, astronomy and astrophysics, biomedical devices and implants, clean energy technologies, food and water security, information and communication technology, marine sciences, nanotechnology, stem cells and vaccines. The AISRF grants can be used for research, conferences, workshops and fellowships for early-career researchers thus focusing on several the key strategies of knowledge diplomacy. <https://www.industry.gov.au/funding-and-incentives/collaborating-with-india-on-science-and-research>.

Sustainable Development Solutions Network (SDSN)- Climate Change: This successful multilateral knowledge diplomacy initiative was established by the United Nations in 2012 to mobilize global scientific and technological expertise to promote practical solutions for sustainable development especially in the area of climate change. SDSN work is guided at the global level by a group of internationally recognized experts. Universities play a major role in research and innovation projects in 32 countries involving researchers from across different disciplines and sectors as well as the theme based groups. In addition, a Universities Partnership Network develops curriculum based on the new knowledge developed through research. All SDSN projects aim to close the gap between emerging research and the necessary policy development to effect change especially regarding climate crisis. <http://unsdsn.org/about-us/vision-and-organization/>.

RENKEI- Research and Education Network for Knowledge Economy Initiatives –Japan and UK. RENKEI which means collaboration in Japanese is a university research network and knowledge diplomacy initiative between Japanese and UK universities and the private sector. RENKEI was founded in 2012 with the goal of strengthening relationships between the two nations by developing academic-industry research collaborations that would address major societal issues. The network includes six universities in Japan and eight universities in the UK, as well as dozens of research partners from industry, business and civil society. Between 2012 and 2018, RENKEI's multi-actor working groups organized joint research projects, workshop, and conferences which addressed pertinent issues such as Sustainable Energy, War, Slavery, Aerospace Engineering, Renaissance Entrepreneurship, and Living with an Aging Society. <https://www.britishcouncil.jp/en/programmes/higher-education/university-industry-partnership/renkei>.

This selection of examples individually and collectively illustrates the key characteristics of knowledge diplomacy. They come from different regions of the world, represent partnerships between higher education actors and partners from other sectors and disciplines, are based on reciprocity and mutuality of benefits, and address a variety of global issues.

Issues and challenges

Knowledge diplomacy is not without its challenges. First is the issue of values. Values play a central role in diplomacy and explain why the contribution of international higher education and research to international relations and vice versa is conceptualized in a diplomatic framework and not a soft power paradigm. Knowledge diplomacy recognizes the diversity of priorities and resources among countries and that interests and benefits will differ among partners. However, there is the reality and risk that knowledge itself can be used as an instrument of power to enhance self-interest, competitiveness and dominance by one country. This is why values and principles are important and it is critical to distinguish between a knowledge diplomacy approach and a soft power approach. Unintended consequences are always present. While foresight can help mitigate risks, it is only hindsight that tells the story of impact. The values of collaboration and mutuality which underpin knowledge diplomacy can be easily eroded. There is the potential risk that education, research, and innovation will be used to widen the knowledge divide among countries instead of being a bridge to address global challenges through collaboration, exchange and trust. Knowledge diplomacy can easily become a buzzword to camouflage national and regional ambitions to promote self-interests at the expense of mutual interests and benefits. As the concept of knowledge diplomacy becomes more common place, unrealistic expectations can be made about its role and contributions. Knowledge diplomacy is not a silver bullet. Expectations of its contribution to international relations need to be managed to avoid early misunderstandings or dismissal of its value and potential.

There are many unanswered questions about the concept of knowledge diplomacy. Will universities and individual scholars take a collaborative and mutual benefit approach when competitiveness is becoming more and prominent in higher education? Will politicians appreciate knowledge diplomacy as an international relation's instrument that can advance the interests of some nations without limiting the prospects of others? Can knowledge diplomacy be operationalized in light of competing priorities within and between countries/regions? Can the contribution and impact of knowledge diplomacy be measured? Is it feasible to develop mechanisms where education, research and innovation complement each other to achieve goals that each could not accomplish as stand alone activities? Will knowledge diplomacy be seen as a two-way process whereby strong relations between and among countries will help to strengthen higher education and research? These are but a few of the questions that need to be explored.

Developing a framework, strategies and commitment to knowledge diplomacy cannot be done without facing the harsh realities of international politics and the challenges of the more competitive and turbulent world in which we live. However, the question must be asked whether we can afford to ignore the potential of knowledge diplomacy to address and contribute to the resolution of current national, regional and global challenges. Further reflection, analysis and research is called for to better understand and further the contribution that international higher education, research and innovation makes to strengthening relations between and among countries and to addressing issues that know no borders.

Introduction

This article addresses North–South partnerships in the context of higher education internationalization from the perspective of the Global South. It reflects on the past, present and future of North–South engagements in higher education with reference to the notions of colonization, recolonization and decolonization. In doing so, a decolonial lens is used to gain a deeper understanding of the challenging dynamics of North–South partnerships, particularly regarding continued dependencies and inequalities, and to challenge existing partnerships practices in the broader context of higher education internationalization. At the same time, a decolonial approach serves as a tool to conceptualize and empower positive change by imagining North–South partnerships differently. Before exploring this in more detail, an introductory discussion briefly touches on international higher education partnerships, the meaning of *North–South* and the relevance of the South African higher education sector in this context.

International higher education partnerships

In the 21st century, partnerships are a key element of internationalization activities of universities around the globe, as “institutions that want to be international players have to work with partners, be that in education, in government, in the NGO sector or in the private sector” (Foskett, 2010, p. 139). Playing a central role in higher education internationalization, “the rationale for developing key, strategic, international-education alliances at both the national and institutional level is not so much an end unto itself but a means to achieving academic, scientific, economic, technological, or cultural objectives” (Knight, 2004, p. 27). Partnerships are therefore important for all core functions of universities, including teaching and learning, research and community engagement. One of the most common models of international partnerships are exchanges established to facilitate student and staff mobility (Sutton et al., 2012).

Partnerships for mobility and other purposes such as research collaboration have become a crucial characteristic of internationalization. They are increasingly used as internationalization vehicles (Sutton et al., 2012). For example, strategic international partnerships are a popular and growing tool used by universities to enhance their international reputation (Ford and McMullin, 2016; Maringe and De Wit, 2016). Strategic university alliances mainly aim to strengthen institutional capacity by sharing resources and facilities as well as to support research across disciplines and national borders, especially in response to global challenges (Ford and McMullin, 2016). Global research partnerships facilitate university collaboration to find mutually beneficial and sustainable solutions to the challenges faced by humanity at large (Rensburg, 2016). With no region in the world able to “fully develop its people, let alone its knowledge, without collaboration” (Rensburg, 2016, p. 315), partnerships are also pursued in the context of development and capacity building, particularly in the North–South context. North–South partnerships emerged during the 1990s as the prevailing model for international development assistance (Koehn and Obamba, 2012). At the heart of development cooperation between partners in the Global North and the Global South often lies an assumption that also characterizes industry–university partnerships, which entails that “one partner has the right answers and the other must adopt their way of working” (Foskett, 2010, p. 141). Before exploring the underlying dynamics of North–South partnerships further, it is useful to clarify the meaning of *North–South*.

Global North–Global South

The compound *North–South* is often used in geographical or economic terms. In case of the former, it indicates a geographical divide in terms of countries that are located to the north and south of the equator. In case of the latter, it refers to a wealth divide, with rich nations located in the North and poor nations located in the South (Maringe and De Wit, 2016). While geographic location and economic status can coincide, there is no direct correlation between the two.

In the context of this article, the Global South comprises countries that “are often poor and tend to have a previous history of colonial occupation” (Maringe and De Wit, 2016, p. 304). North–South has a broader meaning in this regard, as it “bespeaks a relation, not a thing in or for itself” (Comaroff and Comaroff, 2012, p. 127). It is used to denote countries that are “differentiated in terms of power, wealth, and especially in relation to previous history of colonial occupation and domination” (Maringe and De Wit, 2016, p. 304). In this sense, it highlights a relational aspect, where the terms *North* and *South* are used to “emphasize relations—authority, exclusion and inclusion, hegemony, partnerships, sponsorship, appropriation—between intellectuals and institutions in the metropole and those in the world periphery” (Connell, 2007, pp. viii–ix). North–South partnerships are understood to be partnerships between higher education institutions in the Global North and their Southern counterparts. In the area of research, for example, North–South partnerships are shaped by colonial legacies in terms of research agendas and collaboration patterns (Boshoff, 2010). Such partnerships are, with reference to the African continent, sometimes also referred to as historical (Teferra, 2012) or traditional (Jowi et al., 2013).

It is important to point out that the notion of North–South is dynamic and can be expanded in a number of ways. *North* does not only refer to the former colonizing nations in Europe but also to the United States of America (USA). Referring to research collaborations involving South African partners, for example, it is noted that colonial linkages could explain why 29 per cent of the country’s co-publications are with partners in the United Kingdom (UK). However, the USA ranks first with almost 32 per cent of all South African co-publications (Boshoff, 2010, p. 486), which underscores the global dominance of the USA and the imperial relationship it has with many other countries in the world. These overall trends are, more recently, confirmed for health sciences research of a South African university, where the USA and the UK have remained the top two international partner countries for co-publications between 1999 and 2015 (De Jager et al., 2020).

Furthermore, North–South relations can exist outside direct colonial or imperial links. In the case of Irish–South African school linkages, for example, “the colonial patterns that lie at the heart of DE [development education] in the UK are replaced in Ireland by a pattern established by Irish Catholic missions” (Gallwey and Wilgus, 2014, p. 524). In this case, dominance is exerted on religious grounds. Further complexity is added when the notion of North–South is used even more broadly as a metaphor for inequality, linked to the above mentioned economic divide between the rich and the poor. It is then possible to point to variations within the North and the South, speaking of “north of the south, south of the north: Detroit as south in the US, Johannesburg as north in Africa, and so on” (Menon, 2018, p. 37). In this sense, Northern partners can be “South-like”, and vice versa.

With all this in mind, the perspective of this article is distinctly Southern. It considers the idea of the Global South an “invitation to imagine the world afresh” (Menon, 2018, p. 40). It speaks from “an ‘ex-centric’ location” and from a position that is “an outside to Euro-America” (Comaroff and Comaroff, 2012, p. 127). This vantage point is illustrated by South Africa, a post-colonial and post-apartheid society in transformation. The country is used as an example and to provide a textured understanding of relevant issues. South Africa is geographically South because it is located south of the equator, on the southernmost tip of the African continent. Economically, the country is typically referred to as an emerging economy. However, while South Africans have become less poor over the course of two decades since the country became a parliamentary democracy, inequality has been on the rise (Gaventa and Runciman, 2016). In relational terms, South Africa is a representative of the Global South due to its shared colonial history with two European countries. In addition, black South Africans endured further domination under apartheid, a system of institutionalized racial segregation enforced between 1948 and 1994, “tied up with white supremacy, capitalist exploitation, and deliberate oppression” (Biko, 1987, p. 28). Apartheid has been described as a special type of colonialism, where the colonizer (white people) and the colonized (non-White people) were not geographically distant but lived within the same borders (Nkwinti, 2016). Non-white South Africans were discriminated against in all spheres of life, including higher education. The legacies of colonialism and apartheid are still felt in the South African higher education sector today and need to be taken into account in any discussion of internationalization.

Internationalization and transformation in South African higher education

For South African higher education, the importance of internationalization has grown since apartheid came to an end in 1994, which is a “reflection of globalization as well as of South Africa’s return to the international community” (DHET, 2013, p. 39). Internationalization is pursued by institutions operating in a sector that is generally underfunded, with government subsidies for public universities declining in real terms. Additional challenges arise due to the sector’s differentiated nature. As a legacy of colonialism and apartheid, inequality remains a key characteristic of higher education in South Africa. Historically black universities were established and maintained to train black people, serving the needs of the colony as well as the apartheid state (Heleta, 2016). The distinction between historically advantaged institutions (HAIs) and historically disadvantaged institutions (HDIs) reflects the lingering influence of colonialism and apartheid, which saw different institutions receive different kinds of status and treatment, along racial lines. Such differentiation mirrors a North–South divide in terms of inequality, with HAIs symbolically assuming a Northern position. To this day, South African universities “continue to ail under the crippling influence of the legacy of apartheid,

with statistics of performance, participation, persistence, dropping out, and quality of educational outcomes still quite traceable along racial lines” (Wits, 2014, p. 10). HAs generally fair better than HDIs in terms of institutional infrastructure, resources, capacity and performance.

Against this backdrop, inequality is not only a characteristic of the higher education system in general but also impacts internationalization, which has not been advanced evenly across the country’s universities (IEASA, 2020). South Africa’s first national internationalization policy framework, whose adoption was formally announced in November 2020, recognizes existing inequalities in terms of internationalization benefits, where HDIs are especially disadvantaged due to low levels of international relations (DHET, 2019). Universities’ internationalization efforts should therefore “be permeated by an agenda that focuses on inclusion and social justice” (IEASA, 2020, p. 4). If applied uncritically, within dominant paradigms, internationalization can further entrench existing inequalities. To help mitigate this potential, internationalization in South Africa cannot be a goal in itself, but needs to be aligned to relevant institutional and national objectives, contributing to transformation, nation building, and the public good.

Addressing and overcoming past inequalities is a key concern of South Africa’s transformation agenda, and transformation goals permeate government policy in higher education as much as in other spheres. The internationalization policy framework developed by the Department of Higher Education and Training (DHET) recommends that universities design their internationalization activities in such a way that first priority is given to the needs and interests of South Africa. After that, “where possible and relevant, the following order of priority focus should be observed in terms of interests: the SADC states; the rest of the African continent; BRICS; the Global South and emerging economies; and the world beyond” (DHET, 2019, p. 22). Such a priority focus is an example of moving the “center”, which is traditionally understood as a synonym for Euro-America or the West. Centering South Africa and Africa signals a shift away from colonialism, which placed Europe at the center of attention and engagement, where Europe was considered the norm or “the gold standard against which the rest of the world was positioned” (Martin and Griffiths, 2012, p. 910). Before exploring in more detail how transformation in today’s South African higher education sector is linked to processes of decolonization, it is important to first briefly outline the history of higher education linkages between South Africa and Europe.

Colonization: historical North–South links in higher education

The idea of higher education and universities in Africa was not introduced by Europeans. Their origins can be traced to three distinct traditions involving the Alexandria Museum and Library, early Christian monasteries as well as Islamic mosques, going back as far as the third century BC as well as the third and first centuries AD, respectively (Zeze, 2006). However, “While Africa can claim an ancient academic tradition, the fact is that traditional centers of higher learning in Africa have all but disappeared or were destroyed by colonialism” (Teferra and Altbach, 2004, p. 23). In addition, universities on the continent were, with only one possible exception of Ethiopia, “shaped by colonialism and organized according to the European model” (Teferra and Altbach, 2004, p. 23), with most “Western” style institutions being established in the 19th century.

While colonialism was effected through political and economic power, “it was also accomplished through cultural subjugation—for instance, through control of the education system” (Wa Thiong’o, 2009, p. 108). Despite differences in the European models, colonial higher education policies of colonizing countries had some elements in common, including limited access, academic freedom and autonomy, the use of colonial languages as well as limited curricula and academic offerings. These features are linked to the main purpose of education in the colonies, which was to support the administrative systems of colonialism (Teferra and Altbach, 2004).

The current South African higher education system traces its origins to the 19th century, and its development has been shaped by European models from the start (Sehoolo, 2006). The origins of some of the country’s oldest and most renowned universities such as the University of Cape Town and Stellenbosch University lie in colleges that were initially set up in 1829 and 1866 to cater for the needs of English and Afrikaner settlers, respectively (Zeze, 2006). Apart from being rooted in a history of British and Dutch colonialism, which saw the setting up of institutions for Europeans in South Africa and modeling them on European examples, the South African higher education system has also been impacted by apartheid. To state an earlier point differently, “South Africa became the last colony to decolonize in 1994 from an internal form of white colonialism called apartheid” (Ndlovu-Gatsheni, 2013, p. 13).

After gaining independence, African countries have generally maintained very strong ties to the countries that represent their former colonizers. In this context, the “impact of the colonial past and of the continuing impact of the former colonial powers remains crucial in any analysis of African higher education” (Teferra and Altbach, 2004, p. 24). Higher education institutions in Africa continue in the way they were set up, following colonial examples. Their programs and curricula continue to replicate colonial European models, and European languages continue to be used as the main medium of instruction (Singh, 2010). European languages, and particularly English, are not only the dominant languages of instruction at higher education institutions in Africa, but they also dominate scholarship:

African universities rely on the knowledge system that has been conceived, developed, and organized based on Western languages. The Western world produces the majority of knowledge conveyed in those languages. African universities do not have the capacity to generate enough knowledge of their own, nor do they have the capacity and infrastructure to process and translate existing ones virtually from the Western world—yet.

Teferra and Altbach (2004, p. 46).

Regarding partnerships, African universities have traditionally partnered with institutions in the Global North (Jowi et al., 2013), especially in European countries or in the USA, and such partnerships have expanded in the first decades of the 21st century (Obamba et al., 2013). The reasons why Southern institutions pursue partnerships with Northern partners are manifold. They are often framed in the context of development. As has been noted in that regard, “There seems to be a cruel irony in the inverse relationship between the size of the development challenges that nations face and the capacity of their university systems to rise to meet them” (Ramphele, 2004, p. 17). Institutions enter into partnerships for reasons relating to promoting innovation, sustainability, competitiveness, capacity building and quality enhancement (Anderson and Maharaso, 2002). Partnerships are also expected to help address challenges such as brain drain, inadequate numbers of academic staff with PhDs, inadequate curricula and poor infrastructure (Fischer and Lindow, 2008). In light of dwindling resources, partnerships help Southern institutions gain access to much needed funds (Malaza, 2011).

African institutions have a long tradition of partnering with their counterparts in the Global North and continue to do so for many reasons. However, North–South partnerships are often understood as problematic, particularly from the perspective of the Global South, as they tend to be imbalanced and disproportionately benefit the Northern partners. In the sections that follow, these imbalances will be discussed in more detail, with specific reference to resources, power and knowledge.

Recolonization: continued Northern domination

This section discusses the relevance of the notion of recolonization in the context of higher education internationalization. After providing a brief overview of the imbalanced nature of North–South partnerships, it explores how a decolonial approach can help understand the complexities and underlying power relations of such partnerships. It ends with a critique of internationalization from the perspective of the Global South, which frames North–South partnerships as an instrument of continued Northern domination and Southern dependencies and, therefore, as a form of recolonization.

Imbalances in North–South partnerships

Generally, “International partnerships can be complex, contested, and embedded with multiple forms of asymmetries” (Obamba et al., 2013, p. 172). Partnerships between institutions in Africa and in developed countries are particularly challenging in that regard, as they are often characterized by inequalities and a dominance of the Global North (Jowi et al., 2013). The imbalanced nature of partnerships involving African universities and their Euro-American counterparts is “due primarily to the gross and sometimes obscene disparity in the financial resources of the partners” (Hagenmeier et al., 2017, p. 87).

Resource imbalances are closely linked to power imbalances, which manifest in different ways. For example, a South African institution is described as having “minority-status” in terms of their engagements with Northern partners. In this dynamic, the Northern partners are perceived to be in a position where they can dictate the terms of the partnership, exerting pressure on the South African institution to conform (Tedrow and Mabokela, 2007). As far as leadership roles are concerned, the North is observed to be involved in more strategic and knowledge-based leadership, while the South’s participation is more at the operational level (Maringe and De Wit, 2016). In other words, the Northern partners are, generally speaking, in the driver’s seat, while the Southern partners assume the role of passengers coming “along for the ride” (Gallwey and Wilgus, 2014, p. 530). Regarding the question of who sets the tone in international research collaborations, the following is noted:

... for many decades the more affluent countries of the world (the political “North”) have been driving—or at least significantly influencing—the science and technology (S&T) and research agendas of poorer countries (the political “South”). The North’s impress on the S&T and research agendas of the South can be explained in terms of a number of factors, the most obvious being the North’s ability to unleash significant amounts of funding for global science development.

Boshoff (2010, p. 482).

North–South partnerships have been described as “highly extractive relationships”, which tend to disproportionately benefit the Northern partners (Maringe and De Wit, 2016, p. 308), especially in terms of facilitating talent migration. Increasing flows of people and finances from the Global South to the Global North is a key characteristic of the global higher education space (Maringe and Foskett, 2010). By recruiting the brightest talent, Northern institutions contribute to the continued depletion of human resources from other countries (Beck, 2013). Regarding knowledge production, the value of partnerships “is not evenly distributed between the partner in the North and the South, with knowledge outlets and authorship arrangements favoring the North” (Beck, 2013). Imbalances in reputation building as gauged, for example, by international university rankings, also favor Northern institutions. Furthermore, North–South partnerships are seen as “opportunities for rubber stamping the hegemony of the West, which exert its authority using Western knowledge and discourses, money and financial incentives to export solutions to an unsuspecting Global South” (Maringe and De Wit, 2016, p. 308). Given their imbalanced nature, North–South partnerships can be critiqued as replicating patterns of economic, geopolitical and other dependencies. Can such partnerships therefore be understood as a form of recolonization? To tackle this question, it is helpful to engage with the notions of coloniality and decoloniality as a point of departure.

Decoloniality

A decolonial position, as assumed in this article, has at its core an interest in exploring how colonialism has shaped the world we live in today. It is also interested in undoing such influence and in driving change. Regarding ways in which colonialism lingers on, participants in study visits between the UK and countries in the Global South have been observed as generally focusing on “inequality in the world *today*, without necessarily understanding the influence of the *past*, (that is, the former colonial relationship between the UK and Southern countries), which potentially denies an understanding of how that inequality came about” (Martin and Griffiths, 2012, p. 909). It is, therefore, imperative to “reconsider the colonial encounter and its continuing impact from the perspective of formerly colonized countries, regions and peoples, but within the context of contemporary globalization” (Crossley and Tikly, 2004, p. 148). Furthermore, “Such critiques will include debates about the effects of post-colonial and globalizing conditions, and the role of global institutions, foreign governments and development aid, seen against the relative levels of influence of African institutions in shaping policy choices” (Wits, 2010, p. 13).

Despite the formal end of different types of colonialism, a decolonial approach recognizes that underlying principles of colonialism still apply, especially in the context of relations between the former colonizers and the former colonized. In other words, “if colonialism is a way of maintaining an unequal international relation of economic and political power [...], then no doubt we have not yet fully transcended the colonial” (Williams and Chrisman, 1993, p. 4). In South Africa, the legacies of all types of colonialism mean that “many structural imbalances, inequalities and injustices remain stumbling blocks for the emancipation of black South Africans” (Heleta, 2016, p. 1). This understanding is linked to the concepts of coloniality and decoloniality, which are closely interlinked.

Coloniality, on the one hand, is understood “as a global power structure that sustains asymmetrical power relations between the Euro-American world and the Global South (Ndlovu-Gatsheni, 2013, p. 11). Furthermore:

Coloniality ... refers to long-standing patterns of power that emerged as a result of colonialism, but that define culture, labour, intersubjectivity relations, and knowledge production well beyond the strict limits of colonial administrations. Thus, coloniality survives colonialism. It is maintained alive in books, in the criteria for academic performance, in cultural patterns, in common sense, in the self-image of peoples, in aspirations of self, and so many other aspects of our modern experience.

Ndlovu-Gatsheni (2013, p. 13).

Decoloniality, on the other hand, refers to “the dismantling of relations of power and conceptions of knowledge that foment the reproduction of racial, gender, and the geo-political hierarchies that came into being or found new and more powerful forms of expression in the modern/colonial world” (Ndlovu-Gatsheni, 2013, p. 14). A “more massive and possibly more profound shift away from modernization towards decoloniality as an unfinished project took place in the twentieth century and is still unfolding now” (Maldonado-Torres, 2011, pp. 1–2). This project involves the “task of the very decolonization of knowledge, power and being, including institutions such as the university” (Ndlovu-Gatsheni, 2013, p. 14). It also needs to be valued as “liberatory thought that gestures towards the possibility of another world and knowledge” (Ndlovu-Gatsheni, 2013, p. 15). Both these aspects are taken up again during the discussion of recolonization and decolonization, respectively.

At this point, it is reiterated that the historical context needs to be taken into account when discussing concepts such as higher education internationalization and partnerships in Africa, as due to colonial legacies the impact of globalization is not felt evenly across the globe, and global networks are, first and foremost, controlled by the North (Tikly, 2001, p. 156). Highlighting how today's internationalization practices are being shaped by colonial histories entails a critical engagement with issues of power, knowledge and being, particularly from an ex-centric position. When critically engaging with internationalization, one cannot help but observe that inequality is a key characteristic of internationalization in general insofar as it is heavily dominated by Northern perspectives in terms of definitions, needs, practices and scholarship (Chasi, 2019). A critical analysis of internationalization is necessitated by the experiences and lived realities of people and institutions in the South.

A southern critique of internationalization

Decoloniality provides ex-colonized peoples with a space to judge Euro-America (Ndlovu-Gatsheni, 2013) and to challenge legitimating narratives (Appiah, 1991). Such critical engagement is in the main driven by those that “are judged to be less interesting, less significant, and more parochial than *those who hold the power to institutionalize their views* judge themselves to be” (Moya, 2011, p. 84). From a Southern perspective, the concept of internationalization can be critiqued at various levels. Internationalization stands accused of cognitive, cultural and technological imperialism (Ndlovu-Gatsheni, 2021). It can therefore not be theorized without paying attention to how it is influenced by globalization in economic, political and cultural ways (Beck, 2013). Traditional internationalization activities such as student and staff exchanges, research collaboration, credit harmonization and offshore programs, to name a few, “follow the logics of academic and intellectual structural adjustments to the dictates of market fundamentalisms” (Ndlovu-Gatsheni, 2021, p. 93).

Models and practices of higher education internationalization are mostly driven by Northern interests and needs. For example, the internationalization drive of the US is seen as an attempt to strengthen the country's quest for domination in political, cultural and social spheres, which is particularly noticeable in the context of study abroad programs (Martin and Griffiths, 2012). Regarding

projects focusing on harmonization of higher education, the Bologna model illustrates continued European dominance (Singh, 2010). This influence is direct, for example, in cases where qualification structures and curricula of African universities are aligned with the Bologna model, or indirect, in terms of borrowing policy models, aiming for greater regional cooperation and articulation or establishing systems for recognition of qualifications as well as quality assurance. The Bologna process is therefore seen as an instrument through which Europe exerts influence on higher education in Africa and other regions in the world (Singh, 2010).

A decolonial perspective also facilitates a critique of commonly used terminology, questioning the very definition of internationalization as a “process of integrating an international and intercultural dimension into the teaching, research and service functions of the institution (J. Knight, as cited in Knight, 2004, p. 9). Viewed from the South, this definition reflects perspectives of the colonizer, not the colonized. Higher education internationalization “cannot be a simplistic process of integration of ‘the rest of us’ into the ‘European’ game” (Ndlovu-Gatsheni, 2021, p. 85). Furthermore, if it is assumed that universities in Africa are essentially (still) colonial, then it stands to reason that they already are international. In that sense, the question arises whether universities in Africa need to de-internationalize to internationalize (Jowi, 2012), with de-internationalization, in this context, understood as synonymous with decolonization. Furthermore, Knight’s definition has become widely accepted and adopted by universities around the world. In a way, its analytical framework serves as a global template for analyzing internationalization in diverse regional and national settings (Singh, 2010). Such universalism is criticized in a decolonial context, where knowledge is situated, where different identities and experiences will shape different assumptions, questions and approaches (Moya, 2011). With all of this in mind, it is possible to interpret internationalization as a form of recolonization in the field of higher education.

Internationalization as recolonization

Drawing such a parallel recognizes that colonialism lingers on and shapes the world we live in today. Recolonization is understood here as “a new phase of ‘colonization’” (Saul, 2008, p. 73), one that is much less visible than colonization (Martin and Griffiths, 2012). Recolonization refers to relations where “the South continues to be the suppressed underside of the North” (Comaroff and Comaroff, 2012, p. 115). It captures “a process of quite self-conscious and unapologetic resubordination of much of the Global South ... to a western-centred capitalism ... to be carried out in the name of and under the guise of ‘globalization’” (Saul, 2008, p. 70). In this context, the nature of relationships in internationalization is interrogated from the perspective of power and how it operates (Beck, 2013). It is argued that internationalization, which is complexly linked to globalization, can be understood as a form of recolonization, particularly in light of continued patterns of Northern dominance and Southern subordination.

Recolonization, linked to “the hegemony of finance” and “market-driven and capital-driven economic priorities” (Saul, 2008, p. 73), manifests in higher education as much as in other spheres. In higher education, “The continuing dependence on Western universities and Western education further advances and entrenches former colonial influences” (Beck, 2013, p. 54). Regarding neo-liberal approaches to education, it is noted that “From a postcolonial perspective, a free market approach to both trade and education is seen as a continuation of those old policies of plunder that characterized colonial times” (Martin and Griffiths, 2012, p. 909). While economic dependencies play a key role, dependencies also continue in other ways, particularly regarding the domination of the North in knowledge production and dissemination. For example, powerful Northern institutions such as the World Bank and the European Union “have allocated themselves privileged roles of not only dictating whose knowledge matters, but more importantly, what knowledge is worthwhile and to whom” (Ndofirepi and Cross, 2014, p. 295). Furthermore, patterns of knowledge production and dissemination generally favor the North (Maringe and De Wit, 2016), and the North–South divide in knowledge production is illustrated as follows:

European and North American scholars are only too aware that they can ignore with impunity what is done in peripheral sites like the African continent, while any African scholar who similarly ignores western scholarship puts his or her professional competence at issue.

Nyamnjoh (2012, p. 16).

Linked to such examples of knowledge dependency, global university rankings are an instrument that perpetuates Northern dominance, as such rankings generally favor Northern institutions in terms of their positions in the league tables as well as the methodologies applied in the ranking exercise. Under the banner of international competitiveness, African universities, which are under enormous pressure to “perform or perish” (Rensburg, 2016, p. 307), subject themselves to international rankings and “push lecturers to publish in international journals yet do little to promote journals on the continent” (Nyamnjoh, 2012, p. 9).

Internationalization implicates universities in furthering relations that entrench and maintain a hierarchical world order (Beck, 2013). In that regard, “knowledge and education from Europe and North America are being globalized while that of the Global South is being pushed to the margins” (Ndlovu-Gatsheni, 2021, p. 80). With benefits of internationalization not evenly shared between institutions in the Global North and their counterparts in the Global South, internationalization is considered an “instrument of continued Northern domination in the field of higher education, which finds clear manifestation in North–South partnerships” (Chasi, 2019, p. 105). Facilitated by a decolonial lens, this assertion emerges from a deeper understanding of and critical engagement with the imbalances of resources, power and knowledge that are inherent in such partnerships, as outlined earlier. It takes the underlying power dynamics of these partnerships as well as their extractive nature into account. To illustrate this,

parallels are drawn between exploitative practices—from colonial relations focusing on the extraction of raw materials to the extraction of raw talent and data through internationalization in the present day (Chasi, 2019).

Acknowledging that traditional North–South partnerships have the capacity to entrench and perpetuate inequalities and asymmetries, future partnerships should be transformational in character and partners should engage on equal terms (De Wit, 2015). Applying a decolonial lens is useful in that regard, as it opens up the possibility of considering partnerships an opportunity to bring about change in North–South relations by decolonizing future interactions and by rehumanizing the world (Chasi, 2019).

Decolonization: toward a new paradigm of North–South partnerships

The decolonization agenda is, in general terms, driven by “those situated on the downside of some corresponding and relatively intractable power relation that serves to structure our global society” (Moya, 2011, p. 79). In the context of higher education internationalization, there is a need to counter currently dominant partnerships paradigms and trends and to envision a different future. *Agenda 2063*, the vision of the African Union (AU) for the continent, foresees “a self-re-empowerment of Africa; Africa determining its own future, leading its agenda and developing effective partnership frameworks with its external partners” (AU, 2015, pp. 42). Furthermore, the “new strategic role and place of Africa in the global arena will be based on mutually beneficial partnerships with the outside world” (AU, 2015, pp. 42).

At a Global Dialog on higher education internationalization hosted by the International Education Association of South Africa (IEASA) in 2014, representatives of several national, regional and other organizations working in the field highlighted the “importance of decision-making and practices in the development of internationalization activities that are imbued with ethical considerations and inclusivity” in the *Nelson Mandela Bay Global Dialog Declaration* (IEASA, 2014, p. 2). Furthermore, “internationalization must be based on mutual benefit and development for entities and individuals in the developed, emerging and developing countries” (IEASA, 2014, p. 2). Partnerships have an important role to play in that regard. Focusing on their equalizing role, partners are proposed to operate in a way that aligns with the concept of a “global commons” (Jooste, 2015). Considering the lack of equality a key threat to partnerships, the importance of substantive equality for mutually beneficial and reciprocal partnerships is highlighted (Hagenmeier, 2015). African higher education institutions should continue to develop partnerships with institutions in other world regions “whilst firmly invoking their rights as equal partners in them” (Hagenmeier et al., 2017, p. 88). Illustrating some practical implications of this, the following is observed:

Perhaps not all money should be accepted as a stimulant for development. More importantly, institutions in the Global South should become more centrally involved in determining the agenda behind partnerships, working to ensure that the flows of talent and the mobility of knowledge favors its developmental needs in the same way they do those of the institutions in the Global North.

Maringe and De Wit (2016, p. 311).

In South Africa, decolonization is one of the most pertinent issues affecting the country’s universities. It has most recently come to prominence in the wake of university student protests of 2015 and 2016, which formed part of what is now commonly referred to as the #FeesMustFall and #RhodesMustFall movements. The latter has gained prominence in and outside the country. It highlights the complexities of colonial legacies in South African higher education by addressing a variety of dimensions that urgently require transformation. These include statues, such as the one of Cecil John Rhodes on the campus of the University of Cape Town, which gave the movement its name, as well as symbols and names. In addition, it speaks, more broadly, to issues of access, financing and relevance, with a particular focus on institutional racism, white privilege and black pain.

For higher education institutions as sites of knowledge production, decolonization is particularly concerned with epistemological issues. It speaks to privileging “locally situated ways of seeing, thinking and knowing” (Frassinelli, 2018, p. 5) and involves “seeing the world from where we are, not from the perspective of the West” (Frassinelli, 2018, p. 6). It recognizes that the curriculum “remains largely Eurocentric and continues to reinforce white and Western dominance and privilege while at the same time being full of stereotypes, prejudices and patronizing views about Africa and its people” (Heleta, 2016, p. 2). A key element of decolonization is “the need to move the center from its assumed location in the West to a multiplicity of spheres in all the cultures of the world” (Wa Thiong’o, 1993, p. 16). On the African continent, decolonization is therefore inherently linked to Africanization, which focuses on increasing relevance to local contexts and needs by moving Africa to the center of attention. This entails, for example, placing Africa and African languages at the center of the curriculum, highlighting the contributions of Africa to world affairs (Maake, 2004).

Regarding the reconstitution of the literature department at the University of Nairobi in the late 1960s, a new ordering principle was applied focusing on “a study of Kenyan and East African literature, African literature, third world literature and literature from the rest of the world” (Wa Thiong’o, 1987, p. 94) to “establish the centrality of Africa in the department” (Wa Thiong’o, 1987, p. 94) without excluding literatures from other parts of the world. This organizing principle, which puts Africa at the center, is mirrored in South Africa’s national internationalization policy, where it is proposed that in their pursuit of internationalization South African universities must first give priority to the interests of South Africa, followed by those of the SADC states, the rest of Africa, the Global South and then the world beyond (DHET, 2019).

Decolonization has a role to play in bringing about change in internationalization. It has been argued that “there is no genuinely international higher education without decolonization of knowledge and education” (Ndlovu-Gatsheni, 2021, p. 78) and that decolonial internationalization is “predicated on a recognition of the diverse ways through which different people view and make sense of the world” (Ndlovu-Gatsheni, 2021, p. 79). Regarding the curriculum, internationalization in the African context seeks to develop a curriculum that “situates the notion of Africanness as a key lever for engaging with the global world in solving its developmental challenges and in seeking to position itself as a competitive entity in the globally competitive HE context” (Wits, 2014, p. 11). This is an expression of how “Africa and the African come first, before looking to the exportation of the same to the global arena” (Ndofirepi and Cross, 2014, p. 297), in alignment with objectives of *Agenda 2063*. What this means, for example, for internationalization objectives of preparing graduates to be global citizens, is illustrated as follows:

The primary aim of the discourse on Africanisation is to support the needs, interests and aspirations of people living on the African continent. The focus is on raising the awareness of students regarding the special and peculiar needs of their own societies, while simultaneously preparing those students for global citizenship. We shall call the process of creating continental and global awareness “dynamic symbiosis”—a process which will be running concurrently, infusing and buttressing each other.

Hagenmeier et al. (2017, p. 87).

In this sense, Africanization, as a contextual modality of decolonization, offers an opportunity to connect the local with the global, and vice versa, addressing the concern that “the international dimensions of higher education today may have become too disconnected from the local context” (Knight and De Wit, 2018, p. 3). Africanization provides an approach to not only engage with internationalization but to bring distinctly African perspectives to it. For example, African cultures can contribute to Western knowledge, as “one can extract from our indigenous cultures a lot of positive virtues which should teach the Westerner a lesson or two. The oneness of community for instance is at the heart of our culture” (Biko, 1987, p. 31). Instead of focusing on either Euro-America or Africa as the center, the world is re-imagined “with a multiplicity of centers” (Frassinelli, 2018, p. 7) and a “garden of many-colored flowers”, noting that the “floweriness” of the different flowers is expressed in their very diversity” (Wa Thiong’o, 1993, p. 42). There is “cross-fertilization between them. And what is more they all contain in themselves the seeds of a new tomorrow” (Wa Thiong’o, 1993, p. 42). Cross-fertilization between different centers can be facilitated by internationalization. What is important in that regard is that such internationalization confronts and subverts long-standing hierarchies of race, gender and class “for the purposes of re-membering/re-humanizing people and the production of relevant knowledge and just societies” (Ndlovu-Gatsheni, 2021, p. 81).

As a lens, decolonization can be used to address hierarchies and inequalities in higher education internationalization and partnerships. Regarding knowledge imbalances, for example, a decolonial, integrative perspective takes “the form of a genuine synthesis of all existing endogenous and exogenous knowledges, as a paradigm shift into a newly reconstructed and reconstituted space in which no cultural or social group’s knowledge wields more power than others” (Ndofirepi and Cross, 2014, p. 296). A South African case study (Chasi, 2019) reveals how the traditional paradigm of North–South partnerships in higher education can be changed toward more equitable and balanced engagements, facilitated by a decolonial approach. This requires all partners to deliberately and deeply engage with existing imbalances of resources, power and knowledge. It also requires all partners to be committed to mutuality, particularly regarding partnership outputs and benefits.

Transforming the nature of North–South partnerships toward more equitable, mutual engagements forms part of imagining the world differently. It contributes to internationalization that is “a liberatory and rehumanizing project engaging colonialism and dislocating it” (Ndlovu-Gatsheni, 2021, p. 94). Reimagining and transforming the nature of partnerships and internationalization begins with consciousness, with a process of “decolonizing the mind”, as in the title of Ngũgĩ wa Thiong’o’s book (1987). Decolonizing the mind has implications for both Northern and Southern partners. In general, institutions in the South should be less complicit and less accepting of inequalities in their relations with partners in the North. Particularly in early stages of partnerships development, they need to act with increased agency and self-determination. For example, partnerships aims, objectives and expected outcomes need to be negotiated with a certain amount of confidence and assertiveness to ensure that they meet the needs and interests of Southern partners as much as those of their Northern counterparts (Chasi, 2019).

While the imperative for change is generally driven by the South, Northern partners also have a role to play in shifting partnerships paradigms, particularly regarding a commitment to humility, mutuality and flexibility (Chasi, 2019). Humility includes an awareness of positions of power and privilege that Northern partners may enjoy as well as an openness to the possibility of learning from others. Mutuality involves active engagement with Southern partners to ensure that partnership activities create benefit and value for all involved. For this, Northern partners need to be empathetic toward their Southern partners and willing to see the world through Southern eyes. Finally, partnerships can benefit from greater flexibility on behalf of Northern institutions in terms of the conceptualization and implementation of partnerships, leaving room for contingency and the ability to respond to local needs and realities (Chasi, 2019). If partners in both the Global South and the Global North are willing to change their “terms of engagement” in such ways, it stands to reason that North–South partnerships will ultimately be more balanced, equitable, inclusive and socially just.

Conclusions

From a Southern perspective, partnerships between higher education institutions in the Global North and the Global South are often inherently problematic. This is mainly due to their imbalanced nature, which sees Southern partners generally benefitting

significantly less than their Northern counterparts. Through a decolonial lens, such partnerships are, in the broader framework of higher education internationalization, seen as an instrument of continued Northern domination and Southern dependencies. Against the backdrop of colonial links, the power dynamics of such partnerships amount to a form of recolonization.

At the same time, however, North–South partnerships provide us with an opportunity to shift the dominant colonial paradigm toward more equitable, inclusive and mutually beneficial engagements, thus opening up the possibility of a better future. With the Global South serving as a point of departure, decolonization can be used as a tool to critically reflect on existing inequalities in higher education internationalization and partnerships, with a view toward bringing about positive change. More specifically, Africanization, which is concerned with moving Africa to the center as a starting point for contextually relevant engagements, facilitates reflection on how partnerships can be transformed and enriched by African perspectives and contributions.

In line with the concept of convivial scholarship, which “sees the local in the global and the global in the local” and “brings them into informed conversations, conscious of the hierarchies and power relations at play at both the micro and macro levels of being and becoming” (Nyamnjoh, 2018, para. 20), North–South partnerships can be examples of convivial practice. In doing so, they allow for hopeful discourse on internationalization from the perspective of the Global South and contribute to moving the proverbial mountain by transforming partnerships in higher education and other spheres, thus laying new foundations for a different and more equitable future and for a global society that is socially more just.

Introduction

Internationalization of the curriculum is a concept nested within the broader context of the internationalization of higher education and cannot be understood in isolation from that phenomenon. Both concepts have evolved over the past 25 years in response to critical commentary, research and changes in the world in which they are enacted.

In its simplest form the internationalization of higher education is a process related to researching, educating, communicating and trading across national borders. In 2015 de Wit, Hunter et al. updated Knight's (2004) commonly accepted working definition of the internationalization of higher education to the following (*italics indicate changes made to Knight's (2004) definition*):

the *intentional* process of integrating an international, intercultural or global dimension into the purpose, functions and delivery of post-secondary education, *in order to enhance the quality of education and research for all students and staff, and to make a meaningful contribution to society*
de Wit et al. (2015, p. 29).

The research informing the revised definition incorporated perspectives from the Global South as well as the Global North. Hence it provides a valid foundation for a discussion of best practice in internationalization in universities in different regions of the world today.

The revised definition maintains the emphasis on the importance of addressing “the intersection of international and intercultural” (Knight, 2004, p. 49) but in addition emphasizes the importance of *intentionality* and *purpose*. Intentionality implies coordinated, purpose driven planning and purpose is specifically linked to improving quality, engaging all students and staff and providing benefit to the wider society.

The study by de Wit et al. (2015) also recognized that there are global, regional, national and institutional commonalities and differences in the development of internationalization, but that common goals and objectives can also be observed. The 2015 definition they developed is also consistent with definitions of internationalization of the curriculum (Leask, 2009, 2015) and internationalization at home (Beelen and Jones, 2015) both of which focus on the development of all students' international/intercultural skills and understandings through active engagement with diverse people and ideas in class, on campus and in the local community.

Internationalization of the curriculum in higher education has been critiqued in the past for being poorly understood. Leask (2015) makes a clear distinction between the process of internationalization of the curriculum sometimes shortened to IoC) and its product, an internationalized curriculum, as well as the importance of understanding both.

Internationalisation of the curriculum is the incorporation of international, intercultural and/or global dimensions into the content of the curriculum as well as the learning outcomes, assessment tasks, teaching methods, and support services of a program of study
Leask (2015, p. 9).

The focus on a *program of study* highlights the need to plan and scaffold opportunities for all students to develop deep knowledge and advanced skills and hence move beyond approaches to internationalizing the curriculum based on isolated, optional experiences and activities for a minority.

An internationalised curriculum will engage students with internationally informed research and cultural and linguistic diversity and purposefully develop their international and intercultural perspectives as global professionals and citizens

Leask (2015, p. 10).

The focus on *engaging students purposefully* emphasizes the need for carefully planning and assessment of all students' international/intercultural learning across the program of study.

At the same time as IoC was being discussed in Australia, Canada and the UK, Internationalization at Home (IaH) was emerging as an idea in Europe, initially as "anything other than mobility" and later as:

the purposeful integration of international and intercultural dimensions into the formal and informal curriculum for all students within domestic learning environments

Beelen and Jones (2015a, p. 69).

Beelen and Jones (2015) summarize the common features of the two concepts:

They both aim to reach 100% of students, focus on the intercultural as well as the international; are embedded within the core formal and informal curriculum, not simply in the elective elements; are delivered through internationalised learning outcomes and assessment; do not depend on the presence of international students or staff and do not assume that their presence will automatically 'internationalise' the student experience; do not depend on teaching in English; and are specific to individual programmes of study and the academics who deliver them (p. 8).

In summary, the main difference between IoC and IaH is that IaH specifically and deliberately excludes mobility experiences, whereas IoC does not exclude it but sees it as insufficient on its own, emphasizing the importance of integrating the learning from those experiences into the curriculum at home for all students (Leask and Green, 2020).

Some have addressed the relationship between IoC and IaH by combining the two terms as "internationalization of the curriculum at home". In Europe and Latin America, both concepts have been used to focus internationalization on a broader range of activities than outbound and inbound mobility and programs taught in English. In Australia, the UK and Canada they have been used to draw attention to the importance of higher education institutions preparing all students to live and work, as citizens and professionals who understand the deep and complex relationships between the "local" and the "global" in their professional and personal lives.

The above discussion highlights just some of the complexity of internationalization of the curriculum, often masked by its ubiquitous nature. Some of this complexity is due to the fact that the terms *internationalization* and *curriculum* are themselves variously understood. The study of curriculum itself has much to offer both IaH and IoC. The curriculum has been less well researched in the higher education sector than in the school sector in the past, although it has received more attention in recent years, particularly in Australia and the surrounding region. Hicks (2018) notes that this literature uses a broad definition of curriculum as "a process for connecting and integrating university learning and teaching into coherent and meaningful experiences for students" (p. 1). He also noted an increase in research into internationalization of the curriculum and higher education and in the last decade.

This research has been informed by the work of various educational and social philosophers including but not limited to John Dewey (learning as an active, social activity), Jack Mezirow (transformative learning), Paulo Freire (the link between individual and social transformation); Pierre Bourdieu (the link between education and culture), Michel Foucault (the relationship between power, knowledge and social change) and Kwame Anthony Appiah (cosmopolitanism). The influence of these and other theorists on the practice of internationalizing the curriculum is evident in a focus on active learning and on learning outcomes and learning design that foster the development of students' critical skills and international/intercultural understanding in multiple settings over time. For example, within the formal degree program, but also in the co-curriculum, through engagement with diversity in class, on campus and in the community. They have prompted increased emphasis on the ways in which the personal transformation of students engaged in an internationalized curriculum will contribute toward social change, and specifically the creation of a fairer, more equal and just society—locally and globally. They have also prompted concerns about the elitist nature of approaches to internationalization focused on a minority of mobile students traveling primarily within the Global North.

With reference to a growing body of relevant literature this article discusses some characteristics of an emerging paradigm of the practice of internationalization of the curriculum and identifies three good practice principles for curriculum internationalization in the 21st Century. It is important to note that this discussion is a continual work in progress, as more research is conducted and as practice evolves.

An emerging paradigm of internationalization of the curriculum “for all students”

Six characteristics of this emerging paradigm of internationalization of the curriculum at home for all students are summarized here and described in more detail below, with reference to relevant literature.

First, conceptually and practically this emerging paradigm is based on an understanding of the “*curriculum*” as a *system*—a system in which the many parts work together to restrict or extend students’ learning in class, on campus and in the community, at home and abroad. A system that will directly influence the contributions graduates make to their local communities and to the world.

Second, *preparing all students for life and work in a globalized world*, and the attributes that should therefore be developed in graduates of an internationalized curriculum have assumed increasing importance in the discussion. This amounts to a shift in focus toward learning outcomes (of all students) rather than *inputs* such as mobility experiences (for an elite minority of students). There are a number of ongoing discussions concerning the specific nature of these attributes, how to achieve them and what to call them in an internationalized curriculum.

Third, connections between *decolonization of the curriculum and cognitive justice* and the internationalization of teaching and learning are emerging as increasingly important in discussions of internationalization of the curriculum. In some areas this is interpreted as programs of study making space for students to critically examine dominant knowledge paradigms, their strengths and their weaknesses. It may result in reading lists that are inclusive of a broad range of views of the world, rather than an exclusive range that reflects the global distribution of power.

Fourth, *interculturalization* of the curriculum is assuming greater prominence in this new paradigm. The intercultural and international elements of the curriculum have traditionally sat beside each other. Until recently the international orientation has dominated, always in first place (e.g., international/intercultural). However, this emphasis is shifting, with the intercultural assuming greater significance as a result of an increased focus on the development of international and intercultural learning outcomes for all students, regardless of their ability to have a mobility experience as part of their degree.

Fifth, *active learning* is increasingly recognized as at the heart of an internationalized curriculum, at home as well as abroad. For academic and student services staff, active professional learning in communities of practice is also recognized as an important part of both the initial and ongoing process of internationalization of the curriculum.

Sixth, in this emerging paradigm, internationalization of the curriculum is approached as a *planned, purposeful, ongoing process* of review and quality improvement.

(1) Curriculum as a system

Educational literature has defined the *curriculum* as being inclusive of the stated *purpose* of a course or program of study (including intended learning outcomes), the *teaching and learning processes*, what is *assessed* and *how* it is assessed, as well as *the students’ experience of learning beyond the classroom* through activities organized by the university on campus and in the community (Barnett, 2000). Mestenhauser (1998) identified the importance of moving away from “fragmented, unintegrated and enclosed” (p. 7) approaches to internationalization of the curriculum—fragmented by disciplinary thinking, approached as an add-on, enclosed within individual projects and courses. Such an approach denies the potential that the complexity of curriculum as a system offers. Curriculum is indeed complex having multiple dimensions, each comprised of a network of interconnected parts. Leask (2015) identifies three dimensions of the curriculum. The formal, informal and hidden curriculum. She describes the *formal curriculum* as the content described in the syllabus and the orderly, planned schedule of experiences and activities that students must undertake as part of their degree program. The *informal curriculum* is the learning that happens out of class, including for example support services and additional activities organized by the university and its affiliated associations, clubs and societies. These activities are usually optional and not assessed, although they may support assessed learning within the formal curriculum. Examples include peer mentoring programs, peer assisted study sessions and cultural festivals organized by clubs and societies. These activities are an important part of the overall student experience, and they can contribute to the creation of campus culture which supports international and intercultural learning.

The third important dimension of the curriculum is the *hidden curriculum*, rarely discussed and largely invisible to many. Studies of the hidden curriculum in higher education are also more uncommon in higher education than in primary and secondary education (Margolis et al., 2001). The hidden curriculum comprises the various unintended, implicit and hidden messages including the norms, values and belief systems that are embedded in both the formal and informal curriculum. For example, the textbooks that are selected send a “hidden” message concerning *whose knowledge counts* in the curriculum and by implication, whose does not (see Leask, 2015, 7-15). Attention to the hidden curriculum invites consideration of issues around decolonization of the curriculum and cognitive justice (discussed below). Hidden messages are also conveyed through the informal curriculum when for example all international students are required to complete cross-cultural skills training prior to the commencement of classes but the same is not required of domestic or home students. Is this because the domestic students have the required skills? Or perhaps these skills are not important for domestic students because it is up to international students to “fit in” and make adjustments? Are these the intended messages, part of a socialization process that indeed assumes that international students need to become “more like us”?

The formal, informal and hidden elements of the curriculum are connected, rather than discrete—a dynamic system of parts working together as a complex whole. Intended learning outcomes, pedagogy, assessment, disciplinary knowledge systems, generic skills development, content and experiences in and out of the classroom all shape the lived experience of all students

and contribute significantly to their international and intercultural learning throughout their degree program. The point where all three elements of the curriculum connect is a dynamic space, offering rich opportunities for learning for all students.

While all three dimensions of the curriculum are identifiable and important, when internationalization and interculturalization of the curriculum are discussed, it is the formal and informal curriculum that is most often the object of discussion. However, it is equally important to pay attention to the hidden curriculum.

(2) Preparing all students for life and work in a globalized world

Increasingly we see a move toward approaches to internationalization of the curriculum at home focused on the development of graduate attributes related to global learning and global citizenship. Graduate attributes (sometimes called “graduate qualities”) are used in universities predominantly in the US, UK, Canada, Australia and parts of Europe to describe the unique set of soft skills, values and attitudes that will characterize graduates from a particular university. The purpose of internationalization of the curriculum to prepare graduates for “the highly interdependent and multicultural world in which they live and (will) have to function in the future” (Harari, 1992, 53) is facilitated by the description of graduate attributes that are specifically international or intercultural in nature at institutional, program and course level (Leask, 2001).

Internationalization is also connected with the preparation of students for life and work in a global economy (Robson, 2011) and therefore with the employability agenda (Jones, 2013). Graduates it is argued will need to be employable internationally and/or be able to work in multicultural/multinational teams and/or should be committed to ethical action and social responsibility on a global scale.

Global citizenship, described as a combination of knowledge, skills and attitudes that will prepare students to live and work in a globalized world, has increasingly been used as a graduate attribute of an internationalized curriculum. For example, Ogude (2007) argued that internationalization of the curriculum in South Africa should not only generate new knowledge but should also be connected to preparing graduates to be globally competitive. In 2009, the Association of Universities and Colleges of Canada suggested that an internationalized curriculum is “a means for Canadian students to develop global perspectives and skills at home” (AUCC, 2009, p. 5). Global citizenship has become “part of the internationalization discourse in higher education around the world,” (Deardorff and Jones, 2012, p. 295).

A trend to focus specifically on how to provide equal opportunities for *all* students to develop the awareness, skills, knowledge and attitudes required to be responsible global citizens is also evident in university strategies, such as that of Florida International University <https://goglobal.fiu.edu/> whose Global Learning program is focused on providing opportunities for “every student to engage with others to find connections among divergent perspectives ... to create innovative, equitable, and sustainable solutions for our interconnected human and natural communities”.

The term *global citizenship* is not, however, a benign concept. It is problematic through its association with neo-liberal agendas in higher education. There is a danger that narrow notions of global citizenship, focused only on the development of students as economic beings, for example focused on developing students’ ability to work for multi-nationals who trade for advantage over less economically developed groups, is more likely to exacerbate rather than ease existing inequalities produced by colonialism and the dominance of the Global North. It can also be resisted by academic staff who connect the ideal of global citizenship with a capitalist society and its Western heritage (Clifford and Montgomery, 2014). In this regard the very idea of global citizenship is inconsistent with decolonization of the curriculum and cognitive justice also characteristics of the emerging paradigm described here (and discussed in more detail below).

Discussions of cosmopolitanism offer the possibility to resolve this tension. Rizvi (2009) suggests the need for a stronger focus in education programs on cosmopolitanism driven by recognition of increasing global interconnectedness and interdependence, and the need for global solutions to global problems—often cited as rationales for developing students as global citizens. Cosmopolitanism is interpreted in different ways, including as a transnational lifestyle and an ethical orientation toward globalization (Appiah, 2006). Rizvi (2009) argues that cosmopolitanism is only worth pursuing “if we are able to use it as an instrument of critical understanding and moral improvement” (p. 263). Rizvi’s work has influenced discussions of internationalization of the curriculum in significant ways. It has for example resulted in increased emphasis on the development of students’ criticality as part of internationalization of the curriculum. Rizvi (2009) argues that cosmopolitan learning is less about “imparting knowledge and developing attitudes and skills for understanding other cultures per se” (p. 266), and more about helping students to understand the ways in which global processes create inequality, how they may unwittingly be contributing to that inequality and how they might challenge dominant ways of thinking about global connectivity to create a more equal world. This shift is important if we consider higher education institutions as active players in contributing to social change and the creation of a better world (Escrigas et al., 2014).

These ideas have prompted discussion of the importance of developing students’ capacity to imagine difference, question their own assumptions, think as the “other”, and walk in others’ shoes (Lilley et al., 2014). They have also stimulated other discussions around the importance of the ideal global graduate having a personal ethic which is both local and global in scope and includes acceptance of personal accountability for local actions that will have an impact on the lives of people in other, faraway places. Principled decision-making, solidarity across humanity (Schattle, 2009) and a commitment to the collective well-being (Rizvi and Lingard, 2010) are also identified as important for “responsible” global citizenship (Leask, 2015). These discussions continue with some agreement that an internationalized education should develop graduates who have a particular ethical stance in relation to the world.

A focus on providing opportunities for all graduates to develop global mindsets, an understanding of inequalities in the world, and a willingness to accept a form of global social responsibility at home is increasingly the focus of curriculum internationalization. This requires a holistic view of learning and the development of students' global selves (Killick, 2015), a curriculum that addresses the complex, contested and dynamic nature of knowledge and ensures that the scope of whose knowledge counts in the curriculum is broad. Institutional approaches that recognize internationalization as a powerful force for change at the personal level as well as the national and global level are also required. This suggests strategies that connect internationalization of the curriculum at home for all students with advancement of the global common good (Marginson, 2011) for example through programs in the formal and informal curriculum related to the achievement of the United Nations Sustainable Development Goals (Gegersen-Hermans, 2021).

(3) A focus on decolonization and cognitive justice

One of the results of colonization has been that Western ways of knowing have shaped our educational frameworks and our dominant political and economic systems. Decolonization of the curriculum is a critical view of traditional ways of knowing and learning (Stein and Andreotti, 2016) that stimulates the exploration and nurturing of new possibilities for content and pedagogy, and broadens the foundation of knowledge and values on which the curriculum is based.

There is no one way to decolonize the curriculum. We might, for example, have students critically examine the ways in which dominant approaches to knowledge production and distribution have shaped international markets and economies and the positive and negative impact of that on the local market and economy. We might also consider if and how this contributes to reproducing and strengthening social problems from generation to generation, perpetuating and exacerbating inequalities; and explore alternative approaches and what they might offer (Escrigas et al., 2014). Decolonization of the curriculum might also include imagining and envisioning how alternative cultural views of the world and diverse knowledge systems can be acknowledged, examined, valued and included for the perspectives they offer.

In terms of practical examples, in areas such as medicine, physics, nutrition, and geology a curriculum based solely on commercial research funded by companies in the Global North may distort the community of knowledge and result in social injustice on a global scale (McArthur, 2013). In this case decolonization of the curriculum might involve students examining how the commercial funding of the research on which the curriculum is based might have had an impact on the questions researchers asked, where research was undertaken and who benefited from it. They could also consider how commercial funding has in some areas resulted in secrecy and restricted access on the open sharing of ideas, competition and economic self-interest replacing the common good of humanity.

In the humanities, Breit et al. (2013) discuss de-westernization of the journalism curriculum. However, while positive steps are evident in general education and in specific disciplines such as sociology (Hack, 2020) this area is still often overlooked.

Cognitive justice refers to the right of different knowledges to coexist so long as they sustain the life, livelihoods, and life chances of people. A cognitively just curriculum will recognize that different ways of knowing and understanding co-exist in the world, each intimately connected to the cultures, practices and beliefs of groups of people; and that all societies, not just the post-industrial, are knowledge societies. It will also recognize that higher education privileges some knowledges over others relegating that which is tribal, Indigenous and traditional to obsolescence—and will take steps to address this situation (Visvanathan, 2021).

There is no doubt that in both the formal and the informal curriculum in higher education in some countries in the Global South local knowledge traditions and paradigms are valued less than those coming from the Global North. This is in part because colonization has provided a vehicle for internationalization and modernization through the introduction of international and knowledge and values into the curriculum. The key issue here is the extent to which those perspectives dominate, the status they are afforded, and how they are used. Are imported knowledge and values presented as superior? Have they replaced traditional knowledge in the curriculum completely? If so, then paradoxically internationalization of the curriculum at home through the lens of decolonization and cognitive justice is akin to curriculum localization. It might for example, include creating spaces for Indigenous knowledge and approaches to learning in the curriculum. For example, there may be a requirement that all academic programs include Indigenous knowledge or perspectives in consultation with local Indigenous people, and that all commencing students complete a compulsory co-curricular module exploring Indigenous Australian history, culture and customs and the foundations of Indigenous knowledge. Such programs simultaneously communicate the extent to which the university values Indigenous knowledge, develops in students a broader graduate capability of cultural literacy by requiring students to engage in critical reflection about the cultural foundations of knowledge and their own attitudes, values and beliefs (La Trobe University, 2016).

A range of other approaches to reimagining internationalization of the formal and informal curriculum through decolonization of the curriculum and cognitive justice are described in Robson (2011), de Wit and Leask (2017), Green and Whitsed (2015) and Montgomery (2019).

(4) Intercultural first, then international

The *intercultural* has long been associated with the *international* in discussions of internationalization of the curriculum. Many different definitions of intercultural competence have been applied within the field. They include: "the ability to communicate effectively and appropriately in intercultural situations based on one's intercultural knowledge, skills and attitudes" (Deardorff, 2006, p. 247), "the understanding of others' world views" (Deardorff, 2006, p. 248), knowledge of others and of oneself and

skills to interpret, relate, discover, interact as well as a valuing of others' values, beliefs, and behaviors (Byram, 1997), "the culture-specific and culture general knowledge, skills, and attitudes required for effective communication and interaction with individuals from other cultures" (Paige et al., 2003, p. 177). In their model of "Global Literacy" Killick and Foster (2021) include "cross-cultural capabilities", which "incline and enable students to interact successfully with people they perceive to be different: socially, civically and professionally" (p. 10). Discipline specific examples and models also exist, such as that of Freeman et al. (2009), who developed a taxonomy of intercultural competence designed to assist academic staff to map existing opportunities, as well as design and incorporate new opportunities, for students to become interculturally competent in their study program.

Intercultural competence is clearly multi-faceted and requires the development of complex skills, knowledge and attitudes over time. However, discussions of pedagogies to develop intercultural competence that have been tested in diverse discipline contexts have until recently been quite limited. This is in part because intercultural learning was for a long time wrongly assumed to be an automatic outcome and benefit of intercultural contact on campus, in class and abroad, more intense and almost instantly "transformative" when it occurred abroad. However, multiple studies have shown that this is rarely the case, that intervention is required in classrooms at home and while students are abroad if intercultural competence is to be developed in a program of study (see Leask and Carroll, 2011 for a summary of multiple studies up to that date). There has also been interesting research conducted into pedagogies to develop intercultural awareness, capacities, capabilities and competencies in diverse classrooms at home. Guidance, case studies and examples are described by, for example, Carroll (2015), De Louw and Bulnes (2021), Killick and Foster (2021), Leask and Carroll (2013) and Townsin and Walsh (2016). There is also useful guidance on the sorts of interventions that have worked to improve intercultural learning through connecting learning abroad with learning at home in study abroad programs. See for example, Leask and Green (2020), Gothard et al. (2012) and Weber-Bosley (2010).

However, while the importance of developing all students' global mindsets, skillsets and also heartsets, through an internationalized curriculum has been recognized, until recently the focus has still been very much on international activities such as study abroad and exchange, only accessible to a minority of privileged students worldwide. An increased focus on internationalization of the curriculum *at home* as an institutional strategy has seen some changes in thinking. The discourse has started to shift, to highlight the importance of *interculturality* in the development of students as global citizens and professionals (see for example Jiang, 2011; Jones, 2016, 2019). This is evident in institutional strategies that refer directly to *interculturalization of the curriculum* and provide training for faculty in the design of intercultural learning outcomes and inclusive pedagogy in order to prepare students as effective professionals and citizens in increasingly complex and diverse global and local contexts (Queen's University, 2022; Thompson Rivers University, 2022).

Interculturality is similar to and different from intercultural competence. Interculturality refers specifically to mutually respectful interactions and dialog between people from different cultures, that promote mutual understanding while preserving the cultural identity of each individual. Importantly, the concept of interculturality not only refers to the relations that develop between individuals belonging to different countries or regions of the world, it also takes into account, individuals who are within the same community but who have different characteristics from an ethnic, social or other point of view (Killick, 2017; Killick and Foster, 2021). It is therefore a valuable concept to guide internationalization of the curriculum at home, for all students, because globalization has resulted in increasing diversity in local communities and the massification of higher education has also resulted in increased socio-cultural diversity in classrooms.

Bringing interculturalization of the curriculum to the forefront is a means of engaging a majority, if not all students, in a higher education program that develops the skills and understandings they will need as graduates to contribute to a complex, interconnected, global world. It is a means of recalibrating internationalization to achieve a better balance between activities focused on international/intercultural engagement abroad for a minority of students with activities focused on developing all students' intercultural skills and understandings at home. This balance is important because the terms *interculturalization* and *internationalization* have been closely connected in definitions of the internationalization of higher education since 2004 (Knight, 2004).

Curriculum, teaching and learning have been identified as at the heart of the internationalization process (Hudzik, 2011). Bringing the intercultural to the forefront of program design and delivery usefully broadens the range of theoretical concepts and ideas influencing content and pedagogy to include for example, intercultural theory. When interculturalization is included in a university strategy it positions active engagement with cultural diversity in local classrooms and communities as being at least as important for intercultural/international learning as engagement with cultural diversity abroad.

(5) Active learning

It is increasingly recognized that *active learning* whether in class, on campus, in local communities or abroad is the heartbeat of an internationalized curriculum for students. Active learning includes the use of pedagogies that support students' participation in a range of authentic intercultural/international learning experiences within their program of study, as well as in the informal curriculum. Active learning increases student motivation and engagement, develops critical thinking skills and promotes deep learning. Nussbaum (2010) argues that it is important that students are challenged and supported to become 'thoughtfully critical in a complex world' (p.18). For many, mobility programs are the gold standard of active learning in an internationalized curriculum. However, active, experiential learning is also possible vitally important for those students who cannot participate in a mobility experience. It is also possible to provide all students with opportunities for active, critical intercultural and

international engagement if cultural diversity at home is recognized, and celebrated and students are supported to engage with the “other” in class, on campus, in the community and online. Approached in this way active learning may also assist the integration of international students into local classrooms (Marrone et al., 2018).

Active, experiential learning has also been found to increase the engagement of academic and professional staff in internationalizing their curricula in communities of practice (Green and Whitsed, 2015; Zou et al., 2020). Breit et al. (2013) also found that a diverse community of practice—one that included staff from different cultural, linguistic and disciplinary backgrounds—learned a great deal when they were encouraged and supported to challenge their assumptions about each other, their students and the curriculum and to work together to internationalize their curriculum design and delivery.

(6) A purpose driven, ongoing process

The development of international and intercultural knowledge, skills and attitudes in across a program of study requires purposeful planning and ongoing review of impact on student learning outcomes. The development of skills such as language capability and intercultural competence may need to be embedded in a number of courses at different levels. A range of strategies to assist all students to achieve desired learning outcomes by the end of the program may be required. These might include strategies which mobilize and utilize student services and the informal curriculum in supporting the work undertaken in the formal curriculum.

The internationalization of *higher education* and of *the curriculum* are related and co-dependent processes. They are ongoing, continuous and in some ways at least contextually unique. Context in relation to internationalization of the curriculum is multi-dimensional, including the disciplinary as well as the institutional context. Thus, an internationalized curriculum in nursing will look quite different from one in teaching, engineering, the arts or the sciences. However, it also includes national, regional and global contexts and the ways those contexts interact with each other (see Fig. 1:1, A conceptual framework of internationalisation of the curriculum). Increasingly that context includes the global as it interacts with the local in the development of students as social, human and economic beings.

The framework reflects the “supercomplex” world in which we live—one in which the very frameworks by which we orient ourselves to the world are themselves changing and contested (Barnett, 2000, 257). This world requires regular review and reconstituting of the curriculum as priorities in the different layers of context (represented by the lower half of the framework) shift and change, interdependently. Similarly, the framework allows for variation in the level of influence exerted by different

A conceptual framework of internationalisation of the curriculum

Fig. 1 A conceptual framework of internationalization of the curriculum (Leask, 2015, p. 27).

layers of context in different regions or nations. For example, in some regions the national context may be more important than the regional. Research has found that overwhelmingly academic staff assign primary importance to the disciplinary context (Clifford, 2009). Curriculum decisions usually reflect *dominant paradigms* in the discipline, in international education and in learning design (represented in the top half of the framework) but in the process of internationalization *emerging paradigms* should also be considered.

The staged process of internationalization of the curriculum represented in Fig. 2 is essentially a traditional action research approach applied to the review and revision of curricula. However, there is one key difference between the *Process of IoC* and traditional approaches to curriculum review. This is the inclusion of an *Imagine* stage. In this stage those designing the curriculum are invited to explore new possibilities and ideas, challenge dominant paradigms and think in new ways, taking the perspectives of others into account. This is important because Bartell (2003) found that “some disciplines tend to adopt a relatively narrow focus, impoverished by an absence of intercultural and international perspectives” (p. 49). The process of internationalisation of the curriculum (described in more detail in Leask, 2013, 2015) prompts staff to push the boundaries of possibility in relation to the curriculum by challenging dominant disciplinary paradigms of content, teaching and learning, assessment and support services. The process is applicable to the internationalization of the informal curriculum as well as the formal curriculum. In the review and design of the informal curriculum, student services staff and students are usually the principal actors, whereas in the formal curriculum it is academic staff who are the principal decision-makers.

Another key element of the process of IoC in this emerging modern paradigm of internationalization is working with students as partners in the process of internationalizing the curriculum. Using students as partners is “a process through which all participants have the opportunity to contribute equally, although not necessarily in the same ways, to the conceptualization, decision-making, and practice of teaching, learning and assessment” (Cook-Sather et al., 2014, 6–7). Green’s (2018) research into the engagement of students in the process of internationalization found that using students as equal partners, rather than casual informants, challenged naturalized institutional practices concerning access and equity, outcomes and process, and power and privilege. Her research suggests that approaching students as partners opens up new possibilities and may be a powerful tool for those who seek to create a more inclusive and equitable form of IoC.

Rethinking internationalization of the curriculum

The concept and practice of IoC have clearly evolved over time in response to changes in the world and changes in thinking based on research and scholarly practice. These changes include but are not limited to increasing recognition of the need for all students to understand the relationship between the local and the global, research on approaches to IoC in different disciplines and programs and the use of different theoretical frameworks to shape thinking and practice.

Fig. 2 The process of internationalization of the curriculum (Leask, 2015, p. 42).

The characteristics of an emerging paradigm of internationalization of the curriculum described above have implications for how internationalization of the curriculum is defined and described, which will also influence how we define best practice in IoC. The following “rethinking” of internationalization of the curriculum attempts to capture the salient features described above as the foundation for the discussion of best practice in IoC that follows in the next section.

Interculturalisation/internationalisation of the curriculum is the strategic incorporation of intercultural, international, and global dimensions into the content of the curriculum as well as the learning outcomes, assessment tasks, teaching methods and support services of a program of study. It is a collaborative, scholarly process of review and renewal of the formal, informal and hidden curriculum that respectfully incorporates diverse points of view. Inclusive pedagogies will purposefully engage all students in active intercultural/ international learning at home in class, on campus and in their local communities. The ultimate goal is to prepare all students to make valuable contributions to society as ethical, caring citizens and professionals in an interconnected rapidly changing world

Based on [Leask \(2015, 9\)](#).

This description of internationalization of the curriculum brings the intercultural to the forefront and highlights the importance of the values underpinning the internationalization of higher education. It emphasizes the need to engage *all students* actively in an intercultural/international curriculum. It highlights that the purpose of an internationalized/interculturalized curriculum is to ensure that all graduates are able to make valuable contributions to local and global society as human, social and economic beings.

This means that all students will require:

- intercultural capabilities including the capacity to further improve and develop their intercultural skills and knowledge in their professional and personal lives;
- an understanding of the ways in which what happens locally is and may be influenced by international and global tensions and possibilities;
- an appreciation of the cultural foundations of knowledge, and how international power relations have influenced the disciplines and professional practice;
- an intercultural critical consciousness that both “enables and disposes” globally diverse students to work together to see the complexity of an issue, analyze it and take action based on their collaborative analysis [Killick and Foster, 2021](#).

A curriculum that will do the above requires careful, critical course *and* program design (so that for example, learning of complex intercultural skills can be scaffolded across different year levels). It requires attention to describing *and* assessing intercultural/international goals in the informal as well as the formal curriculum while also identifying the impact of the hidden curriculum. It is concerned with the impact of the system of curriculum design on the total student experience, and to the ways in which international, intercultural and global relations impact everyone’s life and work.

Characteristics of best practice

In simple terms best practice is a method or approach that is superior to alternatives because it produces better results in a particular context. What is best practice in one context may not be best practice in another. Hence *best practice can only be measured against a purpose or desired outcome that makes sense in the context in which it occurs*.

Curriculum design is a cultural statement. Internationalized curricula are the result of complex decisions influenced by multiple layers of context and the values of those who design the curriculum. The culture of the discipline, the program of study and the institutional context will all influence the decisions made by key decision-makers. Decisions such as whose knowledge and points of view will be included, what skills students will develop and how these will be taught and assessed are often informed by ideology. All decisions, by their very nature, exclude other possibilities, sometimes intentionally, and at other times, unintentionally. Disciplines have different approaches to knowledge production and dissemination and to inducting students into their culture and preparing them for professional practice and life as graduates. This has resulted in different interpretations of what internationalization of the curriculum means across disciplines and professions ([Clifford, 2009](#); [Stohl, 2007](#)).

Because approaches to internationalization are also influenced by regional and national higher education policies, best practice in internationalization of the curriculum can only be fully understood and nurtured in context. The conjunction of disciplinary, institutional, regional, national and global contexts will shape both the goals for an internationalized curriculum and the means of achieving them. As contexts are fluid, *approaching IoC as a cyclical process of curriculum review and renewal* is a defining feature of best practice.

As well as fitness for purpose and context, and a process approach, another defining feature of best practice in IoC, is *evidence-based practice*. There is a growing body of research into intercultural teaching and learning and internationalization of the curriculum. Best practice will be informed by this constantly evolving international and interdisciplinary evidence-base, which like other contextual layers, is constantly changing as new research is conducted and new knowledge is created.

Evidence-based practice in IoC also includes scholarly professional practice. Aside from formal research studies, practice in IoC should also be informed by small, local studies, what is often referred to as scholarly professional practice. This requires the *systematic collection and analysis of data and its use to improve educational practices and outcomes within a program or institution*.

In summary, best practice in internationalization of the curriculum will have the following characteristics:

1. have a defined purpose or desired outcome that makes sense in the context in which it occurs.
2. be fit for purpose within that context.
3. be approached as an ongoing cyclical process of curriculum review and renewal.
4. be informed by relevant international interdisciplinary research and methods, as well as locally collected research and evaluation data.

Still, some of these characteristics are difficult to create. The following best practice principles capture core ideas from recent research and developments in thinking concerning internationalization of the curriculum. They are specific enough to guide practice and flexible enough to accommodate application in a variety of different contexts. This is important because research, frames of reference, approaches and discourses of internationalization of the curriculum are dominated by the Global North and as such “privilege the needs and realities of universities in wealthy, industrialized countries in North America, Europe and Asia” (Majee and Ress, 2020, p. 475).

Best practice principles for internationalization of the curriculum

Best practice principles are particularly important for internationalization of the curriculum because of its sensitivity to context in both design and teaching. The three principles proposed here are consistent with the characteristics of best practice identified above.

Principle 1: Inclusive, holistic and values driven

As all graduates will live and work, in an increasingly complex, unpredictable and interconnected world, best practice in internationalization of the curriculum will consider what this means for *all students'* intercultural and international learning, in the design of the formal and informal curriculum.

An internationalized curriculum is a composition that has many connected parts. Outcomes of an internationalized curriculum will be holistic in that together, internationalization of the formal and informal curriculum will have an impact on students as human, social and economic beings.

Discourse is a powerful and often overlooked source of marginalization and privilege for individuals and groups. Discourses of internationalization and interculturalization that are inclusive of the complex realities of those with different histories, for example those affected by the legacies of colonial expansion, will result in different approaches to internationalization that push the boundaries of best practice. Approaching internationalization of the curriculum as a *systematic, purpose-driven ongoing process* that includes critical, inclusive and complicated conversations opens up opportunities to reshape the discourse in ways that would otherwise be impossible.

International and intercultural learning outcomes, content, pedagogy and assessment services are important parts of internationalization of the formal curriculum. Course and program design decisions will often be values driven. Institutions may choose for example, to use the Sustainable Development Goals or Global Citizenship to express their values through a university-wide institutional commitment to internationalization of the curriculum. Such approaches invite and allow many different but related activities to connect with and contribute to a larger whole.

Extra-curricular programs that are holistic and values driven can also be adapted to different contexts. Macquarie University's Global Leadership Program (GLP), launched in the Australian university sector in 2005, has since been adopted and adapted by many other universities in and beyond Australia (Macquarie University, 2021). The program focusses on students' responsibilities and opportunities as global citizens, while increasing their employability and preparing them for a globalized workforce in the 21st century. Skills and knowledge are primarily developed in informal/co-curriculum, and students are actively engaged in the creation of a unique program tailored to their interests which they complete at their own pace. Such programs signal a university's commitment through internationalization to the global common good as well as the private benefit of students.

Student and academic staff interactions with professional associations and community organizations, colleagues and fellow students in other parts of the world, and from different cultural and linguistic backgrounds (at home and abroad) are also an important part of an inclusive and holistic approach.

Principle 2: Purposeful, planned, ongoing

Purpose is expressed in different ways within an institution. It is important that the rationale for and purpose of interculturalization/internationalization of the curriculum is consistent across institutional mission statements, goals and plans and program and course statements and is focused on both the common and the personal good.

Carefully formulated plans and actions directed to achieving intercultural/international learning goals consistent with the mission and values of the institution are required in the short and the long term, for the formal and informal curriculum. Regular

monitoring of achievements against goals, informed by local quantitative and qualitative data will ensure that resources are allocated/reallocated efficiently and effectively.

Learning design at the program and course level can provide all students with opportunities to develop their international and global understanding, intercultural awareness and lifelong learning skills across a program of study. Senior academic leaders in programs of study who make critical decisions about content, employ teachers and induct them into the culture of the School and Program are key actors in the process of IoC.

University leaders, academic leaders, teachers, educational developers, learning designers and students all have important roles to play in ensuring that IoC is implemented in purposeful ways, toward shared intercultural and international goals. IoC is a long-term project, a cyclical process of review and reflection leading to continuous quality improvement, with no defined endpoint.

Active, purposeful engagement of academic staff and students in the process of internationalisation is critical to its success. Best practice will include ongoing professional learning programs for staff and a range of programs in the formal and informal curriculum that support students to develop critical intercultural skills.

Principle 3: Systematic, system-wide and context relevant

An institutional culture that openly and obviously values diversity in its actions as well as its words is an important indicator of best practice consistent with this principle. An institutional culture is built by people (what they say and what they do) and the systems that support them. Institutional leaders should strive to create a culture that openly and obviously values diversity and has a clear *educational* purpose for internationalization of relevance to all students.

The internationalization of higher education is important beyond the academy over the long term. Decolonization of the curriculum and cognitive justice require system-wide changes in thinking and complex conversations within higher education institutions, but also nationally and globally. The process of internationalization of the curriculum provides the space for conversations about these concepts within institutions. Tolerance of diversity and difference, and interdisciplinary encounters are not enough. What is needed is a plurality that actively recognizes the need for diversity and a dialog of knowledges at the local and the global level. In some contexts that will mean engagement with Indigenous people and their knowledge systems, in others it may mean something different.

Higher education institutions have a responsibility to commence and sustain complicated conversations locally, internationally and globally.

Conclusion

The curriculum has the potential not only to give learners access to “different worlds” (Goodson, 1995, p. 27) but also to restrict learners if too narrowly focused. It is the means by which institutions can reach all students and make a meaningful contribution to society by ensuring that the students of today graduate ready and willing to make a positive difference in the world of tomorrow. Internationalization of the curriculum, founded on education and social theories, offers opportunities for the development of graduates as human, social and economic beings committed to the global common good. However, achieving this requires short-term, medium-term and long-term thinking and action on the part of institutional leaders as well as those involved in planning and teaching the curriculum. In the short term, a commitment to thinking differently and imagining new possibilities and approaches to internationalization for both personal and common good are necessary. In the medium term, actions focused on reviewing and rethinking policies, strategies and taken-for-granted approaches to internationalization, including whose knowledge counts in the curriculum, will be necessary to ensure alignment between vision, values and strategy. In the short, medium and long term there are many actions that can be taken to ensure internationalization of the curriculum improves the quality of education for all students and makes a positive contribution to local and global communities now and in the future.

For around 25 years internationalization of the curriculum has been recognized as an essential component of higher education. In this time both the concept and practice have evolved, in response to changes in the context within which universities work and informed by research and scholarly practice in the field. Changes have included increasing recognition of the need for the knowledge base of the curriculum to be diversified and pedagogies and practices to be more inclusive and equitable. The focus has moved to learning outcomes for all students and interculturalizing as well as internationalizing the different dimensions of the curriculum. A range of theoretical frameworks underpin the concept and practice of internationalization of the curriculum in general terms and within and across disciplines. To some extent practice has depended on how deep the institution, individual professors, teachers, staff and students have wanted to go. For some students and staff the result has been transformational, but for most it has not and there is still much work to do to ensure that curricula are inclusive and critical in theory and practice.

Perhaps the biggest change has been increasing recognition that connecting the purpose of internationalization with the notion of developing graduates who can make a “meaningful” contribution to society requires rethinking traditional approaches to internationalizing the curriculum focused on mobility programmes, teaching in English or international student recruitment.

With reference to extant literature and practice in different parts of the world, this chapter has described six characteristics of a paradigm of *holistic and inclusive internationalization of the curriculum*. This paradigm has the potential to significantly increase impact, open up new worlds to all students, and through them extend the benefits of internationalization to local and global communities. An extended and revised description of internationalization of the curriculum and three principles of best practice

have been discussed to facilitate the exploration of this new paradigm of internationalization in diverse contexts. The implications for best practice of this modern paradigm of internationalization of the curriculum have been summarized as three principles, that can be applied in different contexts.

Best practice principles provide flexibility and guidance without being prescriptive. They are useful for those seeking to reimagine internationalization of the curriculum. Ultimately, the pursuit of best practice in internationalization of the curriculum is an ongoing process for institutions everywhere as contexts shift and change, and new ideas and approaches emerge.

A version of this article was published in Spanish as 'Reimaginar las mejores prácticas en la internacionalización del currículo capítulo introductorio'. Introduction

A focus on the global mobility of students has seemingly become a permanent feature of higher education institutions (HEIs). In high-income countries, the ability to attract globally mobile students is now regarded as a marker of status and prestige of HEIs, as well as a major source of their income. Not surprisingly therefore HEIs have developed complex operational systems to recruit international students, underpinned by an ideological discourse that regards internationalization of higher education to be decisive in preparing students to meet the requirements of the global economy. The efforts of HEIs have enjoyed great success, resulting in rapid growth in the number of internationally mobile students in higher education over the past four decades. The number of international students enrolled in a program at a higher education institution abroad from which they expect to receive a formal qualification grew from 2 million in 2000 to 5.3 million in 2017 (UIS, 2019). Once the study abroad and exchange students are added to this figure, the number of globally mobile students could have approached 10 million. Before Covid-19 complicated the trend, rising annual rates of growth of international students were simply assumed in the planning processes in many HEIs.

Although such numbers were unimaginable barely 40 years ago, there is however nothing entirely new about the global mobility of students and scholars. Scholars have always traveled to centers of higher learning beyond their own communities in search of new knowledge. The global circulation and exchange of knowledge across cultures was an important aspect of academic life in the ancient academies of India, China, and the Middle East (Guruz, 2008). During the colonial era, student mobility across borders became linked to the logic of colonialism. It was assumed that the graduates of European universities would return to the colonies, appropriately socialized in “modern dispositions,” indebted to their colonial masters (Seth, 2007). They would become part of the administrative apparatus of the colonial state.

When the colonial era came to an end, student mobility became associated with the projects of nation-building of the newly independent countries. Aid Programs such as the Fulbright Program in the United States and the Colombo Plan in British Commonwealth countries—and similar programs in the Soviet Union—provided talented students scholarships to acquire advanced technical, scientific, and administrative training at universities abroad. The so-called “developed” countries saw it as their moral responsibility to assist the poorer nations that they had once occupied, helping them to realize their national aspirations of social and economic development. Such programs of educational aid however simultaneously served the strategic interests of the economically advanced countries within the broader geopolitics of the Cold War. Global mobility of students thus became a major instrument of public diplomacy, an exercise in “soft power” (Nye, 2005).

Since the mid-1980s, the logic of student mobility has once again acquired a new logic. While the older discourses of foreign aid and public diplomacy have not entirely vanished, the new understanding of student mobility is now tied to commercial concerns. It is increasingly viewed as a source of revenue for HEIs, which, under fiscal pressures of their own, no longer feel obligated to financially support international students from the “developing countries.” Nor are governments any longer reluctant to reduce the number of educational scholarships they offer in the form of foreign aid (Harman, 2004). Instead, international students are viewed as a potential source of revenue. To help them generate income, governments now help universities with a complex administrative technology to recruit fee-paying international students, so long as they meet basic entry requirements. Jokila et al. (2019), for example, show how the Finnish government has sought to convert student mobility into an opportunity to resolve the financial crisis facing its systems of education.

Global mobility of students has thus become commodified, subject to selling and buying. Like tourism, international education is now regarded as a service, an export commodity. Commodification, however, is not an end-state itself but involves a range of dynamic complex processes, including strategies of accumulation, transforming students into consumers, and making market forces relevant to the governance of higher education. In this paper, I use the case of Australian higher education to illustrate how these processes of commodification associated with the global mobility of students have been developed and involve a particular discourse to justify it, as well as a range of commercial practices to sell student mobility and cultivate a culture of demand. I then explore how such commodification has not only transformed the traditional character of higher education but is also performing a role in the formation of a new transnational elite class. At the same time, I argue how the logic underlying this mode of thinking

about global mobility of students has been unsettled by the pandemic, opening the possibilities of radically reimagining international higher education. These possibilities, I argue however, will remain constrained unless ways are found to tame the relentless commodification processes.

Processes of commodification

According to Leys (2012), “the dominant process underlying the transformation of life in all societies, since at least the mid-nineteenth century is the conversion of things and activities into commodities or commodification.” The idea of commodification thus refers to the transformation of social relationships formerly unaffected by the considerations of commerce into business relationships, relationships of exchange, of buying and selling. An ever-increasing number of goods that were once owned by the public have, under modern practices of capitalism, been commodified. While goods have always been commodified, in a globalizing economy, the rate at which services are also being commodified has also been remarkable (Roberts, 2015). In recent decades, services such as health and education have been broken up into commodities through which profits are now derived.

It was Karl Marx who first provided a most comprehensive account of the processes of commodification in the mid-nineteenth century. Commodity, he argued, is “an external object, a thing which through its qualities satisfies human needs of whatever kind” (Marx, 2011, section 125) but which can be exchanged for something else, namely money. Marx believed that a commodity has both use and exchange value, that is, it can be used both to satisfy our needs and potentially have monetary value. It can thus be subordinated to the logic of capitalism since it could be exchanged in the market. A commodified service has value, which implies that it represents a quantity of human labor. Under the conditions of a non-commodity economy, Marx suggested, the general human labor does not manifest itself as value, which means that there is no basic contradiction between use-value and exchange-value, concrete labor and abstract labor, social labor, and individual labor. Under capitalism, however, all labor can be converted into monetary value. A factory worker, for example, need no longer be seen as a human being but as an entry in a business ledger, Marx noted, turning human relations into economic transactions.

Since Marx made these powerful observations, ever-increasing aspects of human activity have been converted into commodities. Marxist thinking shows how capitalism expands by commodifying social relations, a process whereby commodity production replaces pre- or non-capitalist forms of production. Capitalism does not, however, only commodify products it also seeks to extend the market reach of those products, potentially around the world. Under changing conditions, it finds new opportunities, while adjusting itself to the particularities of the local contexts. For example, historically, colonialism enabled the reach of capitalism to be expanded across the globe, converting local goods and services that were never subject to commercial exchange into commodities, developing new cultural tastes in the colonies and establishing new circuits of ownership, production, distribution, and consumption (Pieterse, 2010). At the same time, automation has enabled capitalism to create new products for sale. Developments in means of transport have over the decades also opened opportunities for goods to be transported across vast distances.

What these examples demonstrate is that the processes of commodification are dynamic and change in line with shifting conditions. So, for example, as public sentiments and state regulations change, it becomes possible for many services that once belonged to the realm of social responsibilities and obligations, such as age care, to be turned into commodities. Over the past few decades, new practices of commodification have become possible within the new transnational phase in the development of the global capitalist system. Driven largely by technological revolutions, particularly in communication, transportation, marketing and management, globalization has created the material basis of a more extensive globally networked society, marked by transnational cultural and political processes, opening the possibilities of the global integration of social life. As modes of accumulation have become globalized, national production systems are fragmented, making economic growth increasingly dependent on globalized circuits of production and consumption, extending the processes of commodification. As Robinson (2004, p. 6) has noted, globalization has greatly “extended outwards to areas that previously were outside the system of commodity production”; and as it has deepened, it has ensured that the “human activities that previously were outside the logic of capitalist production are brought into this logic.”

However, such a march toward commodification has not occurred in any uniform and universal manner but has involved diverse modes of transformation, both discursive and material, through the intervention, for example, of states and corporations and international organizations. Despite this diversity, contemporary forms of commodification have largely been underpinned by a particular understanding of human activities, relationships, and institutions. This understanding is widely described as “neoliberalism” (Rizvi and Lingard, 2010). It refers to a set of loosely connected notions that celebrate the role of the market in reshaping society, with an emphasis on individual enterprise. Focusing on the importance of competition, it seeks to minimize the role of the state, emphasizing policies of deregulation, privatization and corporatization. The hegemonic dominance of these notions has led Brown (2015, p. 36) to refer to it as “neoliberal rationality,” a mode of thinking that assumes that human beings are above all market actors. In neoliberal reason, she insists, “competition replaces exchange as the market’s root principle and basic good.”

While the ideas associated with neoliberal rationality are not entirely consistent and have been articulated and justified in a range of different ways, what cannot be doubted is that as an ideology it has become enormously influential globally (Harvey, 2005). It has moreover shaped the processes of commodification, giving them their contemporary form. Within neoliberal rationality, it has become possible to create new products for sale, justify attempts to commodify traditionally public goods, and encourage the search of new markets both within and across national borders. Arguably, global mobility of students is one such example of commodification, promoted through a range of policy initiatives and institutional practices intended to transform the ways in which students themselves begin to think about their mobility as an economic investment from which they can expect to gain tangible monetary

and other benefits. Such a transformation of their subjectivity is accomplished by shifting discursive claims about the purposes and governance of higher education. In what follows, focusing on the illustrative case of Australia, I discuss the ways in which global mobility of students has been commodified through the policies and practices of not only HEIs but also of governments, professional associations, international organizations such as the OECD, and various other actors who have been active in the business of encouraging, recruiting and supporting students to study abroad.

Selling mobility for higher education

Until the mid-1980s, higher education in Australia was widely regarded as a public good (Marginson, 2011). The Australian Government met most of the costs of running universities and the students were not required to pay tuition fees. In 1984, however, the government took a range of highly consequential decisions to “reform” the Australian economy by opening it to global competition. It reduced tariffs and floated the Australian dollar, for example. While these economic policies did not refer specifically to higher education, they had a major impact on reimagining its purposes and governance, justifying an end to the era of free tuition, asking HEIs to consider ways of generating income to grow their operations, and encouraging them to become globally competitive. Within the context of this drift toward neoliberalism, an intense debate took place about the continuing need to support the global mobility of students through various programs of educational aid. In 1986, the Government published two major reports with contrasting recommendations. One of these, the *Review the Australian Overseas Aid Program* (the Jackson Report) supported the “trade” view of higher education, while the *Review of Private Overseas Student Policy* (the Goldring Report) rejected the need to shift to a market-based approach. In the end, the Jackson view prevailed, sowing the seeds of a new way of thinking about international students (Rizvi, 2011).

Over the next decade, Australian universities embraced this shift from “aid” to “trade” in higher education services more enthusiastically than was expected. They began to consider ways of recruiting international students, expanding their global reach, in search of additional revenues to manage the declining fiscal support from the public purse. Effectively, they rearticulated the idea of international education in market terms. They did not however quite abandon the older rationales for internationalization (Knight, 2004), which had stressed the role of higher education in assisting the developing countries toward their “modernization,” helping them to develop social and economically through capacity-building, and in promoting international understanding and intercultural relations. These notions were instead incorporated within the broader canons of neoliberal rationality (see Lipura and Collins, 2020). This rationality implied a new discourse of international higher education, expressed in such policy imperatives as revenue generation and institutional growth as a way of building profile and reputation and diversifying the campus. In relation to curriculum, it suggested the need to develop human resources for a globalizing economy and, with respect to research it stressed the importance of the commercialization of knowledge.

In Australia and elsewhere, this view of internationalization has now become part of a new “commonsense” (Apple, 2000). It interprets the global mobility of students in commodified terms, involving two contrasting lines of thinking: one focused on the need to integrate an “international perspective” into the primary functions of teaching, research and service, and to promote international activities for “mutually beneficial relationship,” and the other pointing to the opportunities that now exist to monetize international student mobility, enabling the formation of “an export industry” in which universities compete for students, funds and status. It is the latter view that has transformed the core character of higher education around the world, unleashing a culture of entrepreneurialism that would have been inconceivable in the mid-1980s. International student recruitment has now become an increasingly dominant feature of the governance of HEIs, with much of their decision-making filtered through the logic of commodity exchange.

As an industry, the idea of internationalization has spawned an administrative technology of recruitment, with certain rules of operation based on an expertise that incorporates knowledge of market segments and specificities, as well as a symbolic language that highlights the multiple benefits of internationalization. Globally, an aligned industry has emerged around the testing of English to meet enrollment requirements, as have Academic English preparation courses, often run by the universities themselves with financial returns as their major motivation (Kedzierski, 2016). Developed also are targeted advertising programs conducted through the media, as well as through educational Expos and market-orientated conferences. While other aspects of internationalization, such as teaching and learning, are not entirely overlooked, market concerns disproportionately attract the attention of senior university administrators, as they struggle to balance their budgets within the context of declining public funds. Indeed, the success of HEIs is often measured in terms of the number of fee-paying international students they are able to recruit. Their financial success is celebrated by government agencies and various ranking systems alike (Hazelkorn, 2018).

To extend their market reach, universities now enter into complex articulation and twinning arrangements with overseas educational providers to ensure a steady flow of in-coming students. A highly complex system now exists in the use of local recruitment agents who are often the first point of contact between potential students and a university. Also established is a vast array of transnational programs in which academics and support staff travel far and wide (Zigurus and McBurnie, 2006). In the image of other service industries, various franchise arrangements are also developed with varying degrees of success. Several Australian, British, and American universities have now also established campuses in strategically advantageous locations, partly to promote brand recognition, but also to expand their commercial operations (McBurnie, 2015). Kondakci et al. (2018) have used social network analysis to demonstrate the emergence of “regional hubs” around which international student mobility is increasingly structured.

Globally, these initiatives have resulted in a spectacular growth in the number of globally mobile students, with shifting patterns of mobility over the past three decades (Hou and Du, 2020). However, this growth could not have been achieved without the role played by governments whose policy settings are highly supportive of entrepreneurial activities, often allowing recruitment practices to take place through their diplomatic missions. While the work of governments in casting higher education in trade terms has been crucial, international organizations, such as the OECD, too have played an important role in legitimizing a market discourse in higher education, well beyond a view of mobility that was already familiar to them through such programs as Erasmus and various other scholarship schemes. Governments have also participated actively in negotiations over the General Agreement in Trade of Services (GATS) at the World Trade Organization (WTO), aimed at determining a globally agreed set of rules for trade in educational services (Sidhu, 2007). In Australia, a close nexus has also been forged between student mobility for higher education and immigration policies (Robertson, 2013), which other countries such as Canada and the United Kingdom have sought to emulate, within the context of what Mok et al. (2020) refer to as the “quest for global talent.”

Understanding student demand

These initiatives have enjoyed considerable success in institutionalizing a commodified view of the global mobility of students. Recognizing the potential, HEIs have created an administrative technology of recruitment designed to build supply, but, as is the case with other service industries, these technologies have also had the effect of building demand, encouraging potential students to view themselves as consumers able to imagine the various benefits of higher education abroad. Traditionally, the motivations of international students were quite diverse. They included such factors as the lack of opportunities at home; perceptions of better curriculum and pedagogy; the prestige associated with international education; following the family tradition and social networks; interest in travel and a cosmopolitan life; greater freedom and independence abroad; possibilities of immigration or permanent residence; and so on. The new neoliberal logic consists in several additional, and perhaps more weighty, factors, most notably those relating to the returns on educational investment and better employment prospects, as well as certain beliefs about the value of international education in the global labor market. In this way, it is not only HEIs that have embraced the neoliberal imaginary, most international students have too, with their shifting subjectivities (Mathews and Sidhu, 2005).

As the number of international students on their campuses has increased, it has made Australian HEIs more attractive to potential applicants. In a highly mediatized space, stories of agreeable and meaningful experiences have been circulated by HEIs and their recruitment agents, often endorsed by students themselves. Alumni networks have also been cultivated to promote the many benefits of international education. As HEIs have become culturally diversified their appeal to students has also intensified. These factors have had the effect of greatly increasing demand for global mobility. The perceptions that international graduates have a better chance of obtaining prestigious jobs in multinational corporations have also contributed to building demand, as has the growing attraction of cosmopolitan lifestyles, most notably in Asia’s rapidly increasing middle class, where international education has become a marker of social status and prestige. These supply and demand factors have thus been drawn into synergy in support of the processes of commodification.

In the 1990s, Australia was a global trendsetter in prompting this commodified view of global mobility. However, its success has been emulated by other systems of higher education. Recognizing the shifting motivations of international students, they too have begun to embrace a similar discourse about the importance of global mobility, focusing similarly on the commercial opportunities associated with “the export of higher education.” To attract international students, universities in Germany, France and Netherlands have, for example, developed specific academic programs in high demand areas such as Business and Technology. Countries such as Egypt, South Africa and Singapore also have sought to become major regional hubs of commercialized international education (de Wit et al., 2017). Convinced that English is now the *lingua franca* of the global economy, most of these universities have begun to offer courses in English to attract international students. Much of the focus of their recruitment efforts has been on Asia, based on the recognition of strong desire for cosmopolitan experiences that now exists in its rapidly growing middle class.

This desire has indubitably served to create and strengthen what Sklair (2001) refers to as a “transnational elite class.” International students and their families are arguably either drawn from this class or seek to join it. In Asia, for example, many wealthy parents often write a script for their children’s future education as soon as they are born. This script now includes higher education abroad. The rapid rise in the number of international schools in Asia, which have as one of their principal goals the preparation of students for tertiary education abroad, reflects this pattern of desire for international education (Kenway et al., 2017). The growing popularity of the International Baccalaureate (IB) as an entrance examination for accessing high-status universities abroad is also another manifestation of this trend. This shows how while the supply of international higher education has increased rapidly so has the demand.

It is important however to understand the changing nature of this demand. Like other markets, the global market in higher education is not static but has to respond to the shifting perceptions, as well as consumer concerns. There are, for example, some legitimate concerns in Australia about issues of quality, capacity and support provided to international students (see for example, Marginson et al., 2010). There is also considerable evidence of exploitative practices within international education markets that are inadequately regulated. It is also clear that the fields of Business Studies, Engineering and Computer Education remain dominant, with more than 60% of international students around the world enrolled in these disciplinary areas. English appears to have become institutionalized as the language of international education, confirming the knowledge asymmetry that had always existed, but under a market orientation has been reinforced. Furthermore, a large proportion of students appear to

have accepted the view that international higher education is a private good, and that, within its logic, they are consumers with some ability to define its content and mode of governance. They view international education as an investment toward a prosperous future in which their cosmopolitan aspirations and experiences are assumed to be major assets.

New class formations

In this way, global mobility of education contributes to the emergence of a new class politics both within and across nation-states. While the earlier forms of global mobility of students also reflected patterns of global inequalities, the idea of international education embedded within neoliberal rationality performs class relations in several new ways, located within a wider transnational space. Retaining the traces of “colonial modernity” (Mignolo and Escobar, 2013), the idea of international higher education is now aligned to new thinking about global conditions, opportunities and aspirations. Theoretically, then, this shows how the recent transformations in higher education allow us to think about contemporary class formations differently. Since these transformations are located within both national and transnational spaces, international education no longer involves attempts solely to produce a national elite, but a “transnational capitalist class” and its various fractions, for example, “globalizing bureaucrats,” “globalizing entrepreneurs” and “globalizing professionals” (Sklair, 2001, p. 7).

Such class fractions emerge through the works of transnational corporations, media and other institutions of consumption, which now include higher education. Sklair (2001, p. 4) has shown how “a new class is emerging and how it pursues people and resources all over the world in its insatiable desire for private profit and external accumulation.” This transnational capitalist class, he has noted, consists of “corporate executives, globalizing bureaucrats and politicians, globalizing professionals and consumerist elites.” Robinson (2011) has similarly maintained that the rise of the new capitalist class not only works through global circuits of investment and production but also through institutions, such as higher education, that are now entirely comfortable ideologically with the relations of class they represent. (Carroll & Sapinski 2010) have mapped the changing fields of power generated by such elite relations in the interests of the world’s largest corporations and related political organizations.

Global mobility of students is located squarely within this field of power. In so far as it is increasingly catering to the needs of students with global aspirations, embedded in the “culture-ideology of consumerism” (Sklair, 2001, p. 4), it is contributing to new class formations, no longer tied to national interests, but to a global system of accumulation. This system has given rise to new borders and practices of class, encouraging cultural practices, classed behaviors and identities located in a transnational space. Bamberger (2020) has shown cosmopolitan and ethnic identity capital is increasingly accumulated through international student mobility. It is attempting to develop in students a sense of themselves and others like them as cosmopolitan citizens and consumers, linked to each other in social and business networks that span the globe. Illustrative of this trend are the ways in which HEIs around the world now promote a particular notion of “global citizenship education,” focused on the development of a range of personal attributes for a successful life in a globalizing economy and culture. This “soft” view of global citizenship assumes the key predicates of neoliberal rationality, obscuring issues of emergent class inequalities, of “whether and how to address the economic and cultural roots of the inequalities in power and wealth/labor distribution in a global complex and uncertain system” (Andriotti, 2006, P. 5).

As compelling as this characterization of the relationship between globalization and new class formations, it is limited in several important respects. In recent years, the complex relationship between globalization and economic liberalization and emerging class politics has been examined by several scholars. In most cases, this examination has been supported by rich ethnographic research. Drawing upon their research in India, Ganguly-Scrase and Scrase (2007), for example, challenge the notion of homogenous class analysis, such as that proposed by Sklair and Robinson. They show that while many in India have clearly benefitted greatly from the country’s drift toward neoliberal economic policies, and readily pursue the benefits of commodified international higher education, many others among the Indian elite are skeptical of the advantages secured from these reforms. They are deeply conscious of the contradictions associated with the neoliberal rationality that defines India’s liberalization program (Dreze and Sen, 2015), which includes a commitment to the internationalization of its systems of higher education, encouraging the recruitment of fee-paying international students.

What is clear is that the contemporary policies and practices around global mobility of students have generated a range of complex and social tensions, transforming the traditional view of citizens into consumers of education, amid the complex interactions between culture and political economy. This has transformed the dynamics of sociality and has shifted the nature of the politics of higher education as it relates to the processes of class formation. According to Hsin-Huang (2018), the upwardly mobile middle classes throughout Asia increasingly look to the transnational space in which to locate their identities, giving expression to new social formations and aspirations, modes of consumption and ways of being in contemporary urban space, even when their global aspirations are filtered through a deep commitment to local religious, linguistic, and cultural traditions. Systems of higher education are not unaware of this tension and have sought to modify their discourses and practices accordingly, while continuing to view international higher education in market terms.

Traditionally, descriptions of social class have either specified social stratification located within the borders of a nation-state or presented it in terms of the global relations of power, as is the case with Sklair’s analysis of the transnational capitalist class. This binary is misleading. Student aspirations are clearly affected by global forces, while their global experiences and connections potentially reshape their class imaginations and aspirations. However, these shifts are not entirely disconnected from colonial history and local cultural practices and priorities. For most globally mobile students, national traditions continue to matter as they continue to

interpret their sense of belonging through a national cultural imaginary. At the same time, however, they regard global mobility for higher education as a valued route toward global experiences and economic success within the transnational space.

The local is clearly resilient. The power of global capitalism is not as hegemonic as Sklair and others assume. It is a mistake therefore to essentialize the global as somehow separate, external and hegemonic in the shaping of the local's destiny and character. But nor is it irrelevant in the new formations of class relations. As Massey (1994) argued more than 25 years ago, we need a progressive sense of the local, where boundaries are open and social actors are continuously engaged in constructing their sense of the place, out of both internal factors and influences that are produced in their entanglements with places elsewhere. Global mobility of students meshes local and global processes in producing shifting class relations through the continuing particularities of place despite global influences.

Beyond the pandemic

Such tensions surrounding issues of global mobility of students have become abundantly clear during the pandemic. The assumptions that were once made by HEIs in Australia and elsewhere about the continuing rates of growth in student numbers can no longer be sustained. The COVID crisis hit Australian universities hard, with their projections of growth in student numbers in the Australian Government's (2016) "National Strategy" turned upside down. As the lockdown was announced in March 2020, HEIs moved rapidly to online teaching, while many of their Chinese and other international students returned home. Almost overnight, the global dynamics of international higher education was transformed. It remains unclear as to how long the crisis surrounding COVID 19 might last, what order of decline in the number of international students Australian HEIs should expect, how they should plan for recovery if the bodily mobility of students in previous numbers can no longer be assumed.

In Australia, there is a great deal of talk about recovery from the Covid crisis, what the "post-Covid normal" might look like. What is clear, however, is much of this talk continues to valorize cross-border mobility for the purposes of commercial gain. The value of international students continues to be measured in terms of their contribution to the financial sustainability of universities, rather than the transformative possibilities that the pandemic might have opened. In the public discourse, international education continues to be portrayed as a "successful export industry" that is now threatened. This business model still rejoices in the success that Australian HEIs have had in generating revenue from tuition paid by international students, and hence they fear their financial sustainability without that source of revenue. The talk of recovery does not question the underlying logic of international education, and hence the solutions are presented in a "language of arresting the decline in student numbers, expanding and diversifying the market beyond China, rethinking the technologies of student recruitment, meeting the needs of the student consumer, and putting pressure on the government to change the student visa conditions in order to make Australia a more attractive educational destination" (Rizvi, 2020).

Little effort has been made into rethinking international education in a more radical register, looking at the ways in cross-border mobility of ideas, knowledge and media might nonetheless be possible without the movement of physical bodies, using communication technologies, for example. While the pedagogic possibilities of online learning have been widely examined, these too have been linked to commercial considerations, as a possible substitution for the physical mobility of students. Largely ignored is any consideration of how online pedagogy might help to "overhaul the nature of student engagement and student-teacher relations, how the processes of knowledge ownership, creation, distribution and utilization might be reimagined, and how the idea of learning itself might be reconceptualized" (Rizvi, 2020). Little attention has been paid to the potential of online tools for internationalizing higher education by creating new spaces and cultures of reasoning and understanding. As Kalantzis and Cope (2020) have argued, "online education should not be viewed simply as an alternative delivery system," but as a pedagogic approach that opens up the possibilities of "a new perspectives on, for example, what 'communication' means in the classroom and what it is for."

More broadly, it is abundantly clear that new more critical narratives of global mobility and international education are needed, consistent with the emerging dynamics and possibilities of transnationality beyond the pandemic, in terms that are not solely economic but more importantly ethical and political. It is now increasingly clear that the global context within which international education takes place is characterized by multiple ties and interactions linking people and institutions across the borders of nation-states—not always mediated by inter-national relations, but defined by systems that demand reciprocity and mutual benefit. As higher education systems around the world rethink internationalization, they need to consider the new possibilities of collaboration and networking among institutions dealing with knowledge production and dissemination (Vertovec, 2009)—but in terms other than those that are solely commercial.

An opportunity now exists for the post-pandemic "transnational" dynamics of higher education to challenge the asymmetrical power relations that have resulted in unidirectional flows of students—from the Rest to the West. The changing political architecture of the world demands new ways of thinking about internationalization, especially against a growing assertion of knowledge traditions other than colonial modernity (Stein, 2019) and western rationalism (Connell, 2007), as well as the recognition of the importance of non-economic values, such as those relating to the issues of climate change. At the same time, developments in technology have eroded to a considerable extent the distinction between knowledge production and dissemination and have given rise to new pedagogic possibilities of intercultural communication and learning. Major shifts in youth cultures are accompanied by new practices of global networking, transforming the ways in which internationalization might now be envisaged.

These and other developments have highlighted the importance of transnational collaborations in higher education, ahead of a focus on educational markets. They suggest the possibilities of symmetrical transnational links inherent in the emerging distributive systems of knowledge development and dissemination. They indicate the need to create transnational bilateral and multilateral teaching and research networks among universities and industries, as a way of developing new modes of sharing income, resources and effort. This emphasis on transnational collaborations implies rethinking the purposes and governance of higher education.

This new possibilities on internationalization can only be realized by re-examining the traditional curriculum, challenged by the claims of “other” knowledge traditions, developing new pedagogies that are more responsive to recent innovations in social media and the ubiquitous technologies of communication. Beyond the focus on educational markets, the potential of the idea of internationalization lies in the possibility that HEIs can indeed provide leadership in transnational processes of knowledge production and dissemination in ways that are not only economically efficient but also ethically and socially productive. As Appadurai (2001, p. 5) has noted, this demands “deparochialisation” of the dominant modes of research and knowledge production in universities everywhere. Global mobility of students should remain an important goal of universities around the world, but only if it can be rescued from the clutches of the neoliberal rationality.

Introduction

In recent decades historical developments that have made the world a smaller place have intensified at breath-taking pace. Time, space and place have been compacted to an unprecedented degree. The use of English spread during the colonial and neo-colonial periods of the 19th and 20th centuries and has now become even more widespread through the internet. Economies have become inter-dependent regionally and internationally as the relations of hegemony and inequality have persisted and grown. Knowledge and innovation now travel across the world matching the speed of capital and financial flows. Higher education has become “massified.” Cross-border growth in the numbers of international students and faculty who study and teach in countries other than the ones in which they were born has burgeoned. Against this background our interest is in the social relations of integration, separation and conflict which have become entwined within institutions of higher learning. How can we make sense of unfolding developments in the sociology of higher education? We wish to show the usefulness of postcolonialism as portrayed in film in analyzing the experiences of postgraduate university students in South Africa.

There is a genre of writing that focuses top-down on higher education as a system. Thus mega-data are used quantitatively to inform analyses of the size, shape and trends in higher education. Its ideological roots can be traced to the commodification of knowledge. Data are collected to solve what are the pressing problems of the day. There is a business-like concern for “efficiency” and instrumental outcomes encapsulated in practical suggestions. The humanistic perspectives of the humanities, like the academic disciplines associated with it, are devalued. In contrast, the approach adopted here throws into relief the sociology of higher education on the ground. This article follows the publication of a book (Weber, 2017) which interpreted interviews collected at residences at the University of Pretoria, South Africa. These residences housed the largest numbers of postgraduate international students and their South African peers. One way to bring humanity to social study is through the media of novels, film and the arts and through listening with care to the voices of those directly involved.

Representations of the other and voice

Said's (1978) landmark study, *Orientalism*, critiques Western scholarship as portraying the Orient as secretive, exotic, and sensual as opposed to a rational, objective, scientific West. This particular Orient he argues is not a portrait of reality. It derives from and reflects the political and economic power of the West over the East. There is therefore for Said a relationship between the forms and content of knowledge and the social structures of hegemony.

In Lin and Ritchie's (2019) movie, *Aladdin*, we are told, “People see what they want to see.” A “street rat” is insulted thus: “You were born worthless and will die worthless. Only your fleas will mourn you.” The movie nevertheless asks that we identify with the urchin. On one occasion he says, “If only they'd look closer, they'll find the real me.” He succeeds in showing the world his real self, actualizes his potential and in the end marries the beautiful princess. More soberly, in *David Copperfield* by Charles Dickens, the character, Wilkens Micawber famously said, “Something will come up”. The promise that something will come up for street people under capitalism serves to mock them. The national lottery in South Africa uses an advertisement that states, “One day is one day ...”

Black South Africans fought against racial othering and discrimination under apartheid. And yet, in post-apartheid society there have been recurring xenophobic outbursts of violence against foreign nationals from other African countries. The historical victims of prejudice now practice discrimination against fellow-Africans. A student said:

South Africans ... when they see people coming from other African countries the question is, “Why did you leave your country to come and study in South Africa? Were there no universities in your country?” ...

"We don't want you in this country. You should study in your own country." And sometimes when you are finishing your degree the question [becomes] "When are you leaving?" ...

That's ... very rude ... And when you start telling them, "I'm not leaving I'm staying here, I have a future in this country, I have studied, I have improved myself, if there is a job that ties with the degree I have done, I can work here what is the problem with that?" they get very insulted, they get very infuriated. ...

South Africa is for South Africans and not for people from other races [i.e. international students from other African countries]. "The earlier you get out of here the better for us; you people are using our resources."...

quoted in Weber (2017, pp. 96–97).

Similarly, black South African workers who clean university residences were reported by postgraduate students to find the idea repulsive of their daughters marrying Africans from other countries. And there was the somewhat bizarre idea among certain South African students that while African students "from the north" might be black but they did not have to be *that* black. There were degrees of blackness with South Africans (despite the evidence!) perceived to be lighter-skinned than the rest of the Africans. These others were all lumped together as coming from the alien north which one student described as "up there."

The subordinate position and thus silencing of international students becomes manifest in many ways. It derives from, for example, their disempowerment because of their financial struggles to survive and complete their studies in a foreign country that often, albeit not always does not welcome them. In the interview extract above one might ask: Who has power over whom? How? And who consequently is able to insult and humiliate whom? Power and domination are asserted in and through acts of discrimination. Black South African students who discriminate against international students are themselves subjected to discrimination, especially the large numbers who presently study at what were former whites-only institutions. Students spoke about the separation between white and black South Africans in lecture halls. The racial groups also congregated in separate social spaces and restaurants on the campuses. Race relations were described as "not harmonic" and fraught with latent and open conflict. A black South African student made the point that she had participated in a group assignment in which white and black students had been required to work together. She stated that the whites dominated the discussions and that the blacks, herself included, had been passive and quiet. The blacks, faced with, the assertion of white power had in this instance "allowed" it. Nationally, there have been demands for greater recognition and use of African languages and the abandonment of Afrikaans, associated with apartheid, as an official language of certain universities and its use as a medium of instruction. Language is inseparable from the articulation of voice and identity and feeling that one is at home at the university. The number of blacks has increased at historically white universities. However, transforming institutional cultures and curricula which are integral to language have proved to be stubborn. (see for example, Moguerane, 2007; Prah, 2015; Msila, 2009; Thiong'o, 1986; Department of Education, 2008). One the one hand therefore access in terms of numbers has increased for black South Africans; on the other hand once inside they are pushed out because of their experiences at these institutions.

Aladdin represents a Western image of benign masculinity. In the opening scenes of the 2019 film (Lin and Ritchie, 2019) oriental women in a market are attracted to him, the playboy westerner. He seduces them with clever repartee and they are eager to be seduced by him. The scene might be spirited but its playfulness hides the seriousness of its message. Aladdin's persona, like his sexuality, knows no Freudian dark side. His poverty does not bother him. The image is contrasted with the "real" East embodied in the evil Jafar. Jafar is the embodiment of overwrought sexual repression. While Aladdin might smile endearingly; Jafar is constantly angry, sinister and deceitful. His face remains taut throughout the movie. He moreover possesses devilish powers. He casts spells over people. Orientals like him cannot be trusted. Jafar is more and more appropriately dressed as the Genie transforms him into his wish to become the most powerful sorcerer in the world. He progressively wears black with shades of red to the reddish-black attire at the height of his power. The red symbolizes the blood that will flow during his rule at home and in foreign lands. Aladdin enters the city as a rich sultan dressed in white and gold. Jafar's repressed sexuality takes on perverse forms. Soon after Jasmine articulates her refusal in song: "You can't keep me silent ... I cannot be broken ... I won't be speechless," Jafar asserts his mystical powers over her father and forces Jasmine to marry him. Jafar's political ambitions to become the dictator of Agrabah and militarily expand his reign territorially can be compared to his intentions to conquer Jasmine and dominate her. She will no doubt join his harem as his concubine. Her wedding dress is purple-red. Jafar's plans are skuppered when Jasmine escapes to her Aladdin in whose arms she will enjoy self-actualization, freedom of speech and democracy (Lin and Ritchie, 2019).

Discriminatory oppression entails the suppression of voice and myriad misrepresentations of the other. Voice is related to representation and discourse, disdain for and humiliation of the other, and the exercise of power over them. This is also an epistemological question, as Said (1979) argues. Western scholarship speaks for the East in the same way that men might speak for women, the rich for the poor or in which whites might wish to speak for blacks. One can look at it politically and historically. Under legislation passed in 1936 in South Africa, black Africans in the Cape province lost the right to the common-roll franchise. This was replaced with a vote for three white members of parliament and two in the provincial council. All Africans in the country (around more than 75% of the total population) could elect four white senators. The whites would represent the blacks and speak on their

behalf. Before 1936 and decades after similar arrangements until the attainment of majority rule in 1994 were implemented the goal of which was to deny blacks political rights and to disempower them.

Feige and Coogler's (2018) movie *Black Panther* challenges black voicelessness, inferiority and oppression. We are invited to imagine an African country, Wakanda, that is technologically advanced and more developed than the West. Here Africans govern Africans. The film raises but does not engage with portraits of a conflict-free, unchanging, romanticized pre-colonial Africa. Such scenes of the African past are portrayed in *Black Panther*. Consider, for example, the Garden-of-Eden-in-Africa which appears when T'Challa dreams about his dead father and speaks to him. The Wakandan nation repeatedly genuflects before its ancestors. From an idyllic past its latter day elites can draw spiritual inspiration. "I call upon the ancestors ... Heal him" (Feige and Coogler, 2018). Film clips of tranquil rurality hide the modern architectural structures of the country, its wealth and high-tech wonders. Nevertheless, *Black Panther* does disrupt racist perceptions of black people and backward Africa. It presents a vision of what African development might have been had the continent been free of colonialism and neo-colonialism. It de-centres narratives about African and Southern development and history as a function of European history and development. Wakanda, we are told "does not engage in international trade or accept aid." Put another way:

"Here's another [wounded] white boy for us to fix [medically]. This is going to be fun." As the patient wakes up and recovers from his treatment, he confusedly asks, "Is this Wakanda?" The reply: "No its Kansas". He is nick-named "colonizer"

Feige and Coogler (2018).

All the heroes in the movie are black men and women, albeit well-off black men and women whose class position is unproblematised. They can fight in the best traditions of the white heroes in the other Marvel action films. What white people can do black people can do better. The women in the movie are "on top" (Davis 1978). They are strong in word and deed and, like the best brothers in the hood in their kick-ass *attitude*. One is reminded of Richard Roundtree's cool portrayal of a black detective in the *Shaft* movies of the early 1970s. Black attitude jars and stabs at the white status quo. It is in-your-face demonstration of black empowerment rooted in visceral experiences of blackness. Attitude mirrors the (albeit computer-generated) fighting of the women. *Black Panther* is as anti-sexist as the *Shaft* movies were not. The soundtrack was an instant hit, but the lyrics went,

Who's the black private dick

That's a sex machine to all the chicks?

(Shaft!)

You're damn right

Who is the man

That would risk his neck for his brother man?

(Shaft!)

...

He's a complicated man

But no one understands him but his woman

(John Shaft)

Hayes (1971).

The picture of Wakanda is in several ways that of a typical African country and the idea that Africa is one place. Typical African countries are supposedly divided along tribal lines. Centuries ago Wakanda consisted of 5 “tribes”, 4 of which eventually united, except the menacing Jabari who fled to the mountains. Their leader at one point threatens the humans in front of him, “I will feed you to my children” and then laughs, not to worry, “We are vegetarians!” Wakandan elites have trans-historically and across the ages been at war with one another. Who is to be the next ruler-king-dictator? Who will control the valuable and powerful vibranium deposits buried beneath Wakandan soil? The tribal myths about the singularity of African history are good for present day Wakanda – despite its technological advancement. Wakanda, in other words, remains trapped in the imagined continuities of a particularized African past. The physicality of the heroes fighting not only resembles their white counterparts in other Marvel movies, but takes on what are perceived to be primordial forms. *Black Panther* (Feige and Coogler, 2018) repeats colonial and current myths about Africa, its histories and peoples. Similarly, in *Aladdin* (Lin and Rithie, 2019) the precolonial Orient has been colonized by contemporary Hollywood, in the story-line of the poor boy who eventually makes it to the top and the pop orchestral soundtrack deemed appropriate for a tale set in Agrabah. The Bollywood dancing sequences portray happy-happy Orientals. Agrabah, the Orient, India—north, south and central—are one and the same, just like the whole of Africa north of the Limpopo is same—but according to some of our respondents apparently blacker than the south.

As we have argued, these representations are inextricably tied to questions of power, voice and the silencing of the subaltern. I speak from a position of authority over you when I tell you, explicitly or otherwise, that I am superior to you. Spivak (1988, 2016) discusses the problem of whether the lowest and most oppressed groups in society can speak and who can speak on their behalf. There is therefore a degree of continuity and conceptual complementarity between Said and Spivak. It concerns the development of a political consciousness among the poor and marginalized so that they can represent themselves and speak for themselves and politically act by themselves. The African writer Ngũgĩ, as is well-known has raised the question of what language the subaltern might speak and for whom, by himself refusing to write in English. In a different way this question is familiar to anthropologists and qualitative researchers. It is not uncommon for white middle class men from “the university” to “go native” in foreign lands or poor black communities and write reports about them, typically in English. This raises at least 2 other questions. First, certain colonials educated in leading metropolitan universities have led revolutionary movements, despite their formal Western education. They committed what Cabral, himself an example of this group, called “class suicide” by identifying with the oppressed and leading their struggles. On balance these organic intellectuals are exceptional and cannot be said to represent their class. Second what is called Western scholarship is of course far from a unified, timeless body of knowledge. It has been characterized in no small measure by critique and if not an acceptance, a tolerance for critique. While we are born into and socialized by society we also have the ability to critically reflect upon it and ourselves.

Speaking in this context is assumed to be the articulation of thought through the medium of language, education and socialization. It is therefore not only a question of whether or not the subaltern can speak, who speaks on her behalf, and in which language she does so, but also a question of whether thought is written and published or spoken. The subaltern, based on experience of and in the world, have independent insight and representations of reality. The problem as noted above is when qualitative researchers—like ourselves—seek to rewrite and interpret it and present it in a different form and language. From the late 1970s Ngũgĩ challenged the idea that theater was meant to be about actors performing for silent audiences. He wrote plays with which ordinary folk could identify. *Ngaahika Ndeenda* was a play co-written and developed with Thiong'o and Mirii, 1980 at the open-air Kamiriithu Cultural Center at Limuru, Kenya. It proved to be popular through its use of song and the engagement with and active participation of the audience. It attacked colonialism, religion and the postcolonial African elite, portrayed as avaricious and disconnected from the majority of the population. The play was banned and the playwrights were subsequently detained. The content and subject matter of the play and its populist form had irked the government. The specificity of the content mattered for the Kenyan government as it matters in what the academe chooses to write or research about and what it chooses to ignore and remains silent about (see Pillay, 2016).

Politics

In *Black Panther* (Feige and Coogler, 2018) the plot focuses on the in-fighting among the Wakandan well-off who are also its rulers. The populous are faceless and silent, except for chanting and stamping their spears as the princes engage in ritual fights. Politics is further influenced, but to a far lesser degree on the position of the military who swear allegiance to whoever occupies the throne, and what looks like a council of wise elders. But these constituencies play second fiddle to the comings and goings of the princes. The masses do not have voices or roles to play in determining the course of the country. Politically they neither think nor act.

What does the fighting between the main protagonists, Erik Killmonger and T'Challa, represent? T'Challa wants to maintain Wakanda's independence and isolation; Killmonger wants it to use its resources and liberate blacks internationally. He speaks for Pan-African unity and struggle. The movie treats T'Challa sympathetically while Killmonger is the villain, a kill-monger as his name suggests.

Killmonger, addressing the Wakandan elders:

Y'all sitting up here comfortable. Must feel good.

There are 2 billion people all over the world that look like us. But their lives are a lot harder than yours. Wakanda has to liberate them all
Feige and Coogler (2018).

The movie makers interpret the black liberation represented by Killmonger as akin to Wakandan imperialism. Similarly revolution in contemporary colloquial language is associated with the epithet "bloody". Killmonger is a cold-blooded mercenary and revolutionary: "... [he is] hell bent on killing for killing's sake – indeed, his body is marked with a scar for every kill he has made" (Lebron, 2018). Violence and revolution in this sense are devoid of political organization, programmes, ideas or political consciousness. Thought and knowledge cannot be born in acts of revolt. "Your heart is so full of hatred you are not fit to be king (Feige and Coogler, 2018)." Killmonger disrupts middle class liberal sensibilities by his anger and militancy, the product of the colonialism the movie critiques, but which it ultimately eschews. It urges us to view T'Challa sympathetically. He ends up killing Killmonger. In T'Challa we are presented with the wise, humane king who does not want "to wage war" because, "It is not our way." "He is a good man with a good heart." Wakanda must remain isolated and "safe" from the rest of the black world. He cannot reply when Killmonger asks him about the rest of the continent. "Are they not our people too?" (Feige and Coogler, 2018). The solution to Africa's problems is a narrative in which the good black Africans (in alliance with an affable CIA spy!) defeat the bad black Africans. "Perhaps Killmonger's main dream to free black people everywhere decisively earns him the fate of death" (Lebron, 2018).

As Killmonger dies, T'Challa offers to heal him. He declines saying that he will then be imprisoned for his rebellion. He poignantly recalls how black slaves who were transported on ships to America chose to commit suicide rather than live in captivity. This would have been a strong ending. It would have invested Killmonger's character with a measure of humanity (see Lebron, 2018).

Black Panther was a well-known political party active in the United States in the late 1960s and 1970s. It did not reject violence as did other tamer civil rights organisations. It was originally called the Black Panther Party for Self-defense (against police brutality).

... [the Party] mobilized ... many people to fight white supremacy and capitalist exploitation. The Party generated an escalating cycle of insurgency by linking disruptive actions to community programs as part of a coherent anti-imperialist politics ... [which] forged common cause with a wide array of domestic and international constituencies

Bloom and Martin (2016, p. xvi).

As the credits of *Black Panther* roll, the liberal critique of Black Panther-ism and Killmonger resumes. T'Challa buys several blocks of urban ghetto-land to build the first "International Wakanda Outreach Center". He addresses the United Nations (in the presence of the approving CIA-spy!). Wakanda will henceforth share its resources and break its historical isolation. The Black Panther king's message is one of goodwill and peace. Y'all must love one another.

The South African student rebellion of 2015–16 was a national revolt which linked problems in higher education to the wider society. Its politics were different from politics of *Black Panther* because here the masses not only shout, they act, march, organize and formulate demands. They unsettle those in power and contest their hegemony. The most prominent of the *FeesMustFall* struggles of 2015–16 revolved around the racially discriminatory cultures at universities and colleges discussed above, the affordability of higher education, the predominance of English and Afrikaans as languages of instruction, demands that curricula be decolonized and Africanized, and a critique of top-down leadership in university management. More broadly the movement challenged the social agreement between corporate business, the apartheid government and the liberation movement that was supposed to lead to "peace and reconciliation" in a "new" South Africa after the first democratic elections in 1994 (Booyesen et al., 2010).

It is instructive to compare the politics of the *FeesMustFall* protests not only to the politics of the movie makers of *Black Panther*, but to the narratives of the international students we interviewed. They stood aloof from these struggles which were spearheaded by South African students. International students' apparent withdrawal from politics this time and in this country did not mean that they might not participate in future social movements either here or in their home countries. An Iranian student and a Palestinian student spoke about the politics in their respective countries and how they followed unfolding events. The Palestinian related the impact upon his uprooted family which was dispersed across several countries. He was also affected, and deeply so, by the injustice of the situation in Gaza. It was almost impossible to say how these students would react or what they would do when they returned home – in the case of the Palestinian assuming he was permitted entry to his homeland. Similarly, it is difficult to predict how international students in South Africa would act if the xenophobic violence that has hitherto been confined to the townships spills over onto university campuses.

The continuities and contradictions of political change and of political consciousness are manifest nationally and across time. During the 1960s there was little protest in South Africa after the wave of resistance following the Second World War had been

crushed in the aftermath of the 1960 Sharpeville massacre. The Soweto student revolt in 1976 broke the 1960s' political silence and sense of defeat and culminated in the attainment of majority rule in 1994. If the politics of quietism predominated during the 1960s, its opposite, open, mass rebellion predominated during the latter part of the 1970s and especially during the 1980s. Protest politics therefore assume different forms and are contingent upon the times and social circumstances. Many of the tensions in social relations between black South African students and international students occur during inter-personal encounters. These relations could lay the bases for future developments. In the case of South African students on-campus racial discrimination contributed to the protests that occurred in 2015–16. On the other hand our interviews show that the issue that unites most students, irrespective of their country of birth or whether they come from middle class or working class homes, rural or urban areas, are the fees they are required but cannot afford to pay.

Hybridity and change

Said's work is characterized by binaries, between East and West for example. Bhabha (1994) has developed a more nuanced conceptualization in his writing on the relationship between colonizer and colonized. The encounter is described by hybridity, in-betweenness and ambivalence, rather than either-or-isms. This arguably is the opposite of structuralist explanations of how knowledge or certain ideologies gain currency in society. Gramsci stated that the subaltern is not only ruled through absolute power but with their consent. Foucault was interested in how power/knowledge is constructed and disseminated in society. There is a distinction between the explicit use of force to impose ideology as in a police state and its more subtle, stealthy and more sinister dissemination under say liberal democracies. Both are mechanisms of control and are linked to how power can be exercised and how it can be contested.

Cameron and Landau's *Avatar* (2009) is set in the year 2154. Earth faces an energy crisis because all its natural resources have been depleted. There are, however, rich deposits of unobtainium on the planet Pandora, inhabited by the Na'vi. The Na'vi's skins are blue. Humans cannot breathe the atmosphere on Pandora. Their exploration of Pandora is made possible by using Na'vi-human hybrids or "avatars." Jake Sully, the hero of the movie, is such an avatar.

The Na'vi inhabits a sublime forest-paradise which they have to defend against the imperialist humans, or Sky People. The earthlings' ultimate wish is to exploit Pandora's unobtainium deposits. The Blue People, at one point derogatively called "blue monkeys," come to represent oppressed indigenous groups worldwide and the activist causes of environmentalists. The head of security explains that the Na'vi, who, significantly, stand 3m tall above the humanoids, are "fond of arrows, [which] dipped in neurotoxins can stop your heart in a minute." Moreover, "They are very hard to kill" (Cameron and Landau, 2009). The story moves from futile attempts at persuasion to the colonizers' realization of the necessity to use military force. Put the Na'vi and the Sky People together and we have the makings of a "third space," or the embodiment of Dr. Jekyll and Mr. Hyde at the same time and place. The movie does not really explore this hybridity. However the dynamics of the encounters between the Blue People and the Sky people are given some attention. For example, the Na'vi do not kill the "dream-walker", Jake Sully, but allow him in to learn more about their language and culture in the hope that he might be cured of his "madness" (ignorance). In contrast the Na'vi are studied from a strategic and military and a scientific point of view with the goal to eventually conquer them. Jake Sully is initially sent to spy on them. "Just find out what the blue monkeys want," Sully is told (Cameron and Landau, 2009).

The liberal-minded scientists are provided with resources to study the Na'vi. It is presumed that these scientists are sympathetic, perhaps too sympathetic toward them. They were supposed to be "winning hearts and minds" through "education, medicine and teaching them English." In particular they were supposed to find a "diplomatic solution" for the removal of the Na'vi from Hometree, the sacred place beneath which are the richest deposits of unobtainium. Instead relations with the Na'vi become progressively more hostile (Cameron and Landau, 2009).

We are left wondering about the nature of the social relations between the Na'vi and the Sky people: what did the Na'vi learn and assimilate from the humans and vice versa? What are the specificities, complexities and contradictions of this space? How are we to understand the process? This applies to the avatar Scully as well. He is simply shown to be now humanoid, now Blue. Bhabha has theorized about the point of encounter between colonized and colonizer. He is concerned with strategies the colonizer adopts in order to survive but crucially also identity formation and political action: "dealing with or living with and through contradiction and then using that process for social agency" (Bhabha, 1994). The third space constitutes the ways in which oppressed "mimics" what is expected of him or her. This means understanding the ways of the oppressor, his mindset and craftily hiding your real goals in regard to resistance. Hybrid identities and persona are formed in such situations.

As the story in *Avatar* unfolds Scully and the liberals switch their allegiance and any ambivalence they may have had about loyalty to their race and join the Na'vi cause militarily. They defeat the almighty Sky imperialists in battle and send them back to earth. In the movie "going native" is transformative. It means in the end siding with and joining the natives in battle. Scully turns blue this time permanently.

A mixed in-between identity is an unstable identity. Colonial rule might conquer indigenous peoples, impose their culture on them and through education systems socialize the colonized, but this hardly ever occurs in a "pure" form. Indigenous languages, for example, are often not eradicated. The old and the new can become hybridized. Thiong'o, (1986, p. 7) critiques African writers' use of English. As opposed to using their mother tongue when writing, African writers tended to "[enrich] foreign languages by injecting ... "black blood" into their rusty joints". African writers use of English was not "pure", but had been made to "carry the weight of ... African experience by, for instance, making them "prey" on African proverbs and other peculiarities of African speech and folklore".

If we think of hybridization and what Bhabha (1994) calls a “double consciousness” as unstable we can imagine change over time and possibility with traces of the original forms surviving in new, diverse ways. In the end however Jake Scully turned Blue. Prior to this was the act and either-or-ism of war which facilitated the birth of the new. The military encounter of the earthlings and the blue people has political significance because there is nothing indeterminate about war. In this respect war is similar to periods of mass anti-apartheid revolt like the 1980s in South Africa. The double consciousness in identity might be contingent upon political and social conjuncture and it might lead to transformation but might also persist or re-surface beyond the act or event of transformation. Looking into the future, what is the depth and permanence of Scully’s blueness?

Hybrid and ambivalent social relations are evident in the consciousness of black students who come from rural areas and the townships as well as international students who come from other African countries to study in South African towns. This is evident in how students constantly think about home as they live and study away from home. There were South African students from other parts of the country and from rural areas who were now studying at the University of Pretoria who found it to be a place as alienating as the international students from other African countries. The architecture of the University of Pretoria, its buildings, high-tech lecture halls and blended teaching and learning speaks to a modernity and class privilege that black students coming from townships and rural areas experience as bewilderingly strange. Some of them were angered by the clothes and cars certain white students possessed and wore. They typically had attended overcrowded classrooms in schools without adequate water and sanitation and were taught by stressed teachers battling to understand new curricula. These students who were there to succeed and join the middle class were denied the possessions white South African students displayed.

Several students spoke of changing social relations on campuses and in residences:

I think it’s changing because when I ... [arrived] here in 2011 it was in rare cases ... [that you saw] blacks and whites and Indians together ... that place I’m telling you [about on campus] ... it’s for rich people. It’s normally Indians who ... sit there, but nowadays you see Indians, blacks [and] whites.

Although this sentiment was not shared by everyone certain students spoke of gaining an understanding of difference and diversity. For some this understanding came from the shared experience of being students and with the acknowledgment that academic assistance could be given by anyone, not just “people from your geographic region.” It is not just support that fosters understanding but also knowledge:

... because of being with different people ... I think there are no culture shocks anymore. If someone is doing something ... I know ... it’s not to hurt me ... it’s because according to [their] culture [it] is normal. But according to my culture it’s not normal.

And:

You forget about differences, coming together ... in class and being one thing ... [sharing] those notes, those question papers, asking for that help, [encountering] somebody who is asking [for] help from you who is not ... [the] same colour of ... skin ... [T]hat brings the change and you get to interact. You just see people now ... you don’t see [colour] ...

Other students spoke about a willingness to “engage” with each other and the appeal of learning from one another, learning to cook local dishes and learning new languages:

People are beginning to accept differences ... People want to learn more about other countries, they want to visit other countries. And this ... I see [and] I hear in conversations on campus ...

It is in the meeting within the metaphorical third space, on campuses and in classrooms and residences that the possibility of change becomes evident. Foucault (1984) argued that power allows for the possibility of action and resistance, and subsequently, change. We have the ability to recognize and question normalized and accepted belief systems. Belief systems are redefined and reinforced through the flux of ideologies. Belief systems do not delineate an absolute truth that can be discovered and accepted, but instead, represents “a battle about the rules according to which the true and false are separated and specific effects of power are attached to the true” ... a battle about “the status of truth and the economic and political role it plays” (Foucault, in Rabinow, 1991: 74).

A student said:

I’ve [definitely] changed ... I’m more open minded. I came when I was very religious. I think I’ve lost my religion ... [not] in the sense that I’ve lost the values that come ... with my Christianity ... [but] I’m questioning more of the things about religion ... [and] culture ... I think [it’s] good ... my mum would say otherwise [and] my aunt would pray for me right now ... [but] I don’t want to be cramped into one box ... I don’t want to be like someone

who thinks and believes in only one thing you know because I believe I'm more now, more acceptive of different traditions and different ways of doing things because if you look at them, they've also helped other societies you know ... I think I'm more acceptive and a more willing to listen to what someone else has to say regardless of [what] ... I initially believed ...

[F]or instance, I'm more tolerant to ... [and accepting of] gay people now ... [B]ack home it's a ... no go. It's crazy, they kill gay people ... [Y]ou question why you have this anger ... and when you ... look at it ... it's because of what I've heard. I've not really seen the person or interacted with the person and realised that it is their choice ... [B]ack home for instance ... the reason ... I think ... I was so against [gay people] is because there was ... talk that they go into schools and ... force children to become gay and I think that's what many people like me thought ... [M]y cousin has a company which I help him with and they ... [employ] many gay people and these are people who are working and adding value and very good people in society ...

The student's account speaks of a reimagining of the self. The student is almost ashamed of previous biases and prejudices. She questions the foundation of her beliefs and religion, knowing that her family would disapprove of the progressive and liberal views. Change is intermittent and varies from person to person. Many students did not perceive any changing social relations at the university and did not acknowledge change within themselves. It is unrealistic to expect everyone's experiences to have transformative or cathartic effects like this student or like Scully. It is within the locus of struggle and resistance of the third space that we can imagine the possibility of change, especially in times of heightened social and political transformation.

Conclusion

Globalization and the internationalization of African higher education have resulted in large scale cross-border mobility. This has influenced social relations as local and internationals engage one another. Sociologists and historians commonly studied South African society in terms of race, class and perhaps gender as well. Today nationality has become increasingly important as the numbers of foreign nationals from the rest of Africa has grown. Economic, financial, and political integration have influenced our social consciousness, how we view the world and act upon it. It has had a profound impact on our social imaginations (Appadurai, 1996). The cultural and sociological dimensions of globalization are significant and deserve study in their own right.

We have discussed several of the basic tenets of postcolonialism through a review of films and interview extracts. Postcolonialism provides a rationale and a theoretical tool for the study of the sociology of higher education. Said (1979) was concerned with the relationship between East and West and how that relationship flowed from unequal relationships between the colonized and the colonisers. Implicit within this thesis is the absence and suppression of an authentic colonial voice. This has been the starting point of Spivak's work. Voice in this context does not only concern the articulation of thought. Voice is central to politics and political action. Can others speak for the under classes? For women? What happens when they do? Qualitative researchers will be familiar with this problem from a methodological and scholarly point of view. Historians have to grapple with it as well as they seek to portray periods, individuals and groups. The question is also relevant to the creation of knowledge. Today and historically few writings and publications on and about Africa originate from within Africa by Africans.

Postcolonialism emphasizes decentering or looking at the world from the South rather than Eurocentricism, groundedness, othering in social experience and in epistemology, the suppression of subaltern voice, and the complexity of hybrid identities. These concepts can be found in the foundational writings of Said, Spivak Bhabha and Ngũgĩ. They are key themes in the recent movies *Aladdin*, *Avatar* and *Black Panther*. Sequels are planned for the latter 2 films. We await them with keen interest.

We have integrated problems commonly discussed in the literature, such as globalization and the internationalization of higher education through the lens of postcolonialism and film. The latter can be taken as an example of cultural studies in general and can also include the fine arts. Consistent with the humanistic traditions of qualitative research and of interdisciplinarity, it has entailed working with different types of data and trying to integrate them into a coherent story. Postcolonialism is ideally suited to this type of analysis. It can enrich and at the same time elucidate the subject of enquiry. Thus, we have juxtaposed the abstractions of content, and of style of Homi Bhabha with the moviemakers and action scenes of *Avatar*. One of the common criticisms of number-crunching in social science is that we do not encounter and are invited to engage with people and individuals where it matters most – on the ground and in real life. This highlights a familiar problem which we leave for discussion on another occasion about the relationship between the data one collects and the written form in which it is presented in print. In our view too many academic journals, following the natural sciences have cast form into repetitive stone. A further advantage of postcolonialism and popular movies is that it facilitates thinking about national questions and developments such as those unfolding at South African tertiary institutions, internationally. When all is said and done, the overarching topic of our writing on international higher education is well summed up by Alain Touraine (2000), "Can we live together?"

Neoliberal educational restructuring

In the United States corporate school reform or neoliberal educational restructuring has, since the 1980's, largely saturated educational practice, policy, pedagogy, reform, organization, school culture, and curriculum. Neoliberals promote market models of reform including, particularly privatization, deregulation, business language, logic, and assumptions, and the ideology of corporate culture. Neoliberals position public schools as businesses, school districts as private markets, parents and students as consumers of a private service, and knowledge as a commodity to be bought and exchanged. Privatizers contract out management of schools to privately managed charters or for-profit educational management organizations (Byrnes, 2009; Miron, 2011; Miron and Urschel, 2010; Molnar et al., 2010; Peterson and Chingos, 2009). They seek to expand voucher schemes or neo-voucher scholarship tax credits (Welner, 2008), school commercialism initiatives, corporate-style "turn-arounds" on schools and faculty. These schemes fire entire teacher work forces and administrations, bust unions, and drain educational resources. Overwhelming evidence has established the failure of these reforms on their own terms of test score improvement as well as other terms. The standards and accountability movement works hand in hand with privatization to narrow curriculum and pedagogy to that which is numerically quantifiable and testable. These reforms have been a boon to commercialism in the multi-billion dollar test and textbook publishing industries and the technology sector. Additional corporate school reform schemes include making so-called "portfolio districts" that are charter expansion schemes that portray districts as a stock portfolio and schools as stock investments (Saltman, 2010a, 2010b), privatizing teacher education and educational leadership, gutting advanced degrees and certification in teaching and administration in favor of pay for test performance such as value-added assessment (Baker et al., 2010; Saltman, 2010c).

Higher education has been subject to corporate models of reform (Giroux, 2014; Newfield, 2011, 2016). These range from corporate models of management and the disciplining of the labor force to cutting costs and increasing revenue regardless of the relationship to the mission of these not for profit institutions. These also include managerialism and an emphasis on the quantified measurement of all aspects of the university, clientism and consumerism – the transformation of campuses to look like shopping malls, and student retention initiatives organized around entertainment, consumer demand driven program development. Corporatization also includes the vast expansion of a mid level strata of "deanlet" managers and investment in physical sites at the expense of affordable tuition, faculty pay, tenure track faculty (Ginsberg, 2013). Corporatization also involves the usurping of faculty primary responsibilities of governance over curriculum and personnel as the strata of midlevel administration expands. The emphasis on revenue generation, the abandonment of funding by states and the shifting of the cost burden onto students has been a boon to banks but it has created a vast debt bubble and a perverse incentive for students and parents to eschew subjects of study that do not have the most direct commercial implications. Hence, the STEM fields, Career and Technical Education, and business expand as the abstract sciences, the humanities, and the arts are eviscerated. The disciplines which create the conditions for societies to imagine alternative futures and support a collective conscience are at risk of extinction. Corporatization of higher education and the instrumentalism and vocationalism it promotes revises the public purposes of higher education as a public sphere committed to serving the public good and addressing the most pressing public problems.

In the past decades corporate school reformers in K12 have been aided by venture philanthropists and philanthrocapitalists such as the Gates, Walton, Dell, and Broad Foundations, Chan Zuckerberg Initiative and other LLCs, privatization lobbying outfits such as The Alliance for School Choice, and a string of right wing think tanks, consultancies, and supra-national organizations like the OECD, WB, WTO, and WEF (Saltman and Means, 2018). Privatization has been increasingly turning to both "innovative" finance schemes like Social Impact Bonds and impact investing that promote privatization and public resource skimming under the guise of performance accountability metrics and a false promise of cost savings (Saltman, 2018). As well, educational privatization has gone increasingly high tech as online programs, adaptive learning technology, and AI have been sold to districts under the aegis of technoutopian discourse that calls for massive public spending on untested technology products under a promise of innovation and hence "excellence." The new frontier of educational privatization involves the vast expansion of technology products and purveyors selling AI software, curriculum programs, adaptive learning technologies, online Social Emotional Learning programs, and

biometric teaching and tracking and digital surveillance products (Boninger et al., 2019). Tech companies seek profits through contracting and data commerce (Sadowski, 2019). The Covid 19 pandemic turbo charged this industry allowing technology companies such as google Alphabet, Microsoft, Apple, as well as educational test and textbook companies like Pearson, Kaplan, and Houghton-Mifflin to vastly expand their contracting and commercialism presence in schools.

In what follows here I address two of the primary forces driving the neoliberal restructuring of public education: profit motives and ideology. The first and second sections respectively cover these topics. The third section discusses the longstanding uses of disaster to further neoliberal aims. The fourth section contends that critical pedagogy provides a hopeful public and democratic educational alternative to the hegemonic trajectory.

Pursuit of profit

Much of the neoliberal restructuring of public education has been propelled by the pursuit of profit by for-profit corporations and investors. This is exemplified by the multimillion-dollar for-profit education management industry (Miron et al., 2012), the steady push to expand school vouchers that use public money for private school consumption, the expansion of scholarship tax credits that function like vouchers incentivizing parents to opt out of public schools, the deregulation and privatization of teacher education and educational leadership programs, and the shifting of ownership and control over curriculum and pedagogy from teachers and districts to large technology companies and billionaire-controlled corporate foundations. Such market-based reforms intersect with profit interests in the multibillion-dollar test and textbook publishing industries, the information technology and database tracking industries, the for-profit higher education sector, and the contracting industries. Test and textbook publishing companies, especially the largest such as NCS Pearson, Houghton-Mifflin, and ETS, profit from promoting the expansion of standardized testing and standardization of curriculum. These companies invest millions in lobbying for standardized curriculum and assessments at the state and national level which yields billions in revenue. Publishers pursue a variety of educational for-profit ventures, including toys, online services, special education remediation, and teacher certification. Increasingly, for-profit educational companies are becoming media companies and for-profit media companies are becoming education companies. This is evident as media executives participate in neoliberal restructuring efforts and a revolving door between school districts and media corporations. These executives take aim at public schools to grab public tax dollars with for-profit education technology. Similarly, corporate consultants such as McKinsey and ALEC influence, direct, and draft corporate school policy and reform, promoting and profiting from public-private partnership schemes. Despite the neoliberal rhetoric of freeing education from the entanglements of public bureaucracy, corporate reformers and ideologues have developed a multi-dimensional web of bureaucratic infrastructure that uses nonprofit organizations to promote privatization.

On a global scale, the World Trade Organization, International Monetary Fund, and World Bank frame public education as a private consumable, creating the conditions to redistribute governance from public to private sectors by imposing corporate trade rules on nation-states and promoting private for profit forms of educational development in poor nations and discouraging universal free public education.

The business sector has for decades framed public education in the United States as a \$600 billion per year industry, primed for the taking ("Special Report Education a New Push to Privatize 2002") or as slated for destruction and replacement by private schools. Corporate school reform aims to transform public schooling into a private industry nationally by replacing public schools with privately managed charter schools, voucher schemes, and tax credit scholarships for private schooling. The closure of neighborhood schools and massive expansion of de-unionized, nonprofit, privately managed charter schools with short-term contracts is a step toward the declaration of their failure and replacement by the for-profit industry in EMOs. EMOs extract profit by cutting teacher pay and educational resources while relying on high teacher turnover and labor precarity. Charter schools have steadily expanded annually in the past two decades. In Michigan over 80% of charter schools are operated by for profit companies that can skim out educational resources as owner profit. Trump appointed to Secretary of Education a Michigan billionaire lobbyist for school privatization who contributed to both for profit charter and voucher expansion in her state. In her term she promoted the use of public funding for private, for profit, and religious education while bailing out the for profit college industry.

Profit motives through neoliberal restructuring in education involve not just privatization but also consideration of the role of public education in social and cultural reproduction. Social and cultural reproduction involves the ways that education teaches skills and know how wrapped in class-based ideologies that are crucial for capital accumulation and the maintenance of the racialized class hierarchy. These ideologies teach social relationships and identifications that prepare students to take their class-prescribed roles in labor markets. Since the early 1980's the social and cultural reproduction role of schools has changed. Prior to the advent of the neoliberal education era social and cultural reproduction was characterized by what critical sociologists referred to as the "hidden curriculum" of schools. The hidden curriculum was the implicit teaching of skills, know-how, dispositions, and ideologies conducive to reproducing the capitalist economy. In the industrial economy the primary means of profit for capitalists came from paying workers less than the value of their labor. Working class students learned not just basic skills for the industrial economy but especially also dispositions of obedience to authority in the classroom to prepare students to submit to the boss in the workplace. Professional class students largely learned dispositions of dialogue, debate, curiosity, and investigation for them to take leadership roles in the public and private sectors. These different ideologies and dispositions created the social conditions for the replication of class hierarchy. In schools a number of mechanisms sanctified and naturalized the unequal distribution of life chances including grades, testing, sorting and sifting of students, as well as the unequal distribution of cultural capital (socially valued

knowledge, tastes, and dispositions) and the means of acquiring it. Profit was sought by capital through social and cultural reproduction by creating the conditions for labor exploitation – paying workers less for their labor than it is worth. For example, submitting to the authority of the teacher prepares the student to later submit to the authority of the boss.

In the neoliberal era beginning in the late 1970's forms of social and self control began to take different forms to reproduce the economy. The neoliberal transformation of the economy resulted in deindustrialization and the turn to financialization and service sector labor. As Nancy Fraser pointed out, the time and labor-intensive reproductive mechanisms of the industrial economy involving learned self-control such as psychological therapy, rehabilitation for prisoners, and learned dispositions of disciplinary self control for students gave way to more direct controls over the body. The supermax prison and solitary confinement, the epidemic shift to prescription mood and behavior modifications (from Xanax to Ritalin), and the roll out of the increasing militarization and prisonization of schools, the expansion of repressive pedagogies, and the focus on greater corporeal controls. As well, the mode of profit seeking through commercialism and privatization decreasingly depended on making docile and disciplined subjects for the future workforce. In the neoliberal era the long term investment in exploitable labor gives way to the short term profit in contracting. This intersection of short term profit seeking through contracting has increasingly converged with the turn to repressive pedagogical approaches such as charter models that are highly prescriptive, standardized, and homogenous. As well, the intersections of neoliberal restructuring and repression appear as biometric pedagogies and behaviorist grit pedagogies gut dialogic forms of teaching and disregarding thinking and questioning in favor of teaching to the body itself (Saltman, 2016).

In higher education profit motives are driving “partnerships” in which universities serve private business to do worker training. Students end up paying to work uncompensated for businesses. The commercial logic that is now epidemic in higher education has resulted in commercial motives driving curriculum development, program development, administrative mandates, and faculty hiring. Humanities, social sciences, and abstract sciences are threatened as disciplines with dire social consequences. As well, teacher education and educational leadership programs at the nexus of higher education and K12 schooling have been subject to privatization.

The kind of schooling envisioned by privatization advocates aims to transform a current dual system of public schooling into another dual system of public schooling. In the current dual system, elite public schools in rich, predominantly white communities prepare managers, leaders, and professionals for the top of the economy and the state while the underfunded public schools in poor, working-class, and predominantly nonwhite communities prepare the docile, disciplined workforce for the bad jobs at the bottom of the economy and for exclusion from the economy and containment (i.e., disposability). Despite the ceaseless neoliberal and liberal rhetoric of crisis and failure, the public schools (as Freire, Bourdieu, Ollman, and others recognize) do exactly what they are supposed to do: they produce a stratified workforce while sanctifying inequality as a matter of individual merit or talent. The neoliberal privatization reforms maintain the dual system, leaving in place the elite public schools but targeting poor schools and predominantly students of color to turn them into short-term profit opportunities in numerous ways: the contracting, testing, and tutoring schemes but also for-profit management and all the ancillary profits that can be generated through privatization—including the public funds that will pour into marketing charter schools to prospective “customers” through advertising and public relations, and the lucrative real estate deals needed to establish charter schools. At present, the lower end of the dual system provides a deferred investment in low-pay, low-skill disciplined workers and fodder for the for-profit prison industry and the military.

Privatization targets the low end of the dual system and pillages the public sector for short-term profits, benefitting mostly the ruling class and professional class (“poverty pimping”) while doing nothing to transform the dual system of public education into a single system as good as its best parts throughout. As William I. Robinson points out, as capital has exhausted the places for exploitation through colonization and conquest and through the neoliberal privatization of the public sphere, increasingly capital accumulation turns to pillaging the lifeworld and subjectivity and creating new investment opportunities through violence (Robinson, 2020). The steady growth of capitalizing on disaster in education discussed below (New Orleans, Detroit, Chicago, Iraq, Puerto Rico, etc.) exemplifies this trend of using and making disasters in education to create investment opportunities for capital (Saltman, 2016). Privatization increasingly takes form in education as the targeting of affect (Social Emotional Learning) and the aim of fostering “resilience,” the targeting of teachers labor by corporations (replacement of teachers with adaptive learning technology, avatars, and other AI and digital privatizations), and especially contracting arrangements for curriculum and technology products, school management services, and so on (Saltman, 2018). For investors in privatization, the benefits are double: Money can be made in the short run by draining public tax revenue, while the future exploitable workforce can still be produced for the long run. And as the investors are benefitting twice, they can feel good that they are giving poor students “every opportunity” to benefit themselves. Of course, class mobility is declining, economic inequality is expanding, and the onus to remedy social exclusion is shifting onto school kids who will need to be, in the words of Thomas Friedman, more entrepreneurial to get and keep scarcer jobs (Friedman, 2009). Such school reform ideology displaces the violence of the capitalist economy onto the weakest and most vulnerable citizens: children.

Ideological motives

The neoliberal privatization of education is propelled not only by profit motive but also by ideology. Neoliberal ideology positions education not as a public good ideally serving a democratic society or fostering humanistic ideals but as a private good for preparing the economic activity of work and consumption. Neoliberals have utilized a number of key market framing terms to cast education through the lens of the private sphere and business. These include positioning parents and students as consumers endowed with

“choice” of schools, contending that schools must “compete” against each other for consumers, suggesting that some schools should be allowed to “fail,” “just like business,” invoking business clichés of “creative destruction,” “innovation,” and “disruption.” In this narrative, the social is comprehended through radical individualism and a social Darwinian ethos. Neoliberalism sees the individual foremost as an economic actor competing against others for scarce resources. In this view, education creates the conditions for educational competition in preparation for economic competition, initially against others in the nation and then for competition against other nations. As neoliberalism suggests that there is no alternative to the market (the TINA thesis), a primary means of agency for youth is to learn to be savvy competitors and choosers of private services. Knowledge and curriculum in this view are portrayed as consumable commodities that are delivered and consumed by students. In such a view efficacious delivery becomes of paramount concern as opposed to the politics of knowledge, matters of interpretation and judgment, or investigation into the relationship between claims to truth and social authority.

Neoliberal education responds to public problems in private sector fashion, not only through the contracting out of schools and services, but by taking aim at unions, and basing schooling and administration on corporate culture. Neoliberals join metaphors of fiscal discipline with gendered and racialized demands for the disciplining of students’ bodies. In this view the natural discipline of the invisible hand can subject soft, lazy female teachers and indolent black and brown students to the necessary pressures of market competition and choice. Neoliberalism tends toward repression by modeling the school on the hierarchical and anti-democratic corporation and by denying the constitutive antagonisms that structure curriculum. Education becomes about enforcement of the right knowledge as democratic values for debate, dissent, and dialogue become casualties of the neoliberal logic of apolitical post-ideological managerialism.

The neoliberal education movement is funded and promoted by a number of super-rich individuals and owners of large businesses. These people largely believe that because the private sector has served them, the private sector should be a model for public institutions and specifically public schools. Most of the supporters of corporate school reform, despite not owning businesses or having a financial stake in privatization schemes, have been educated to believe the framing and assumptions put forward by the funders and promoters.

On their own terms of increasing standardized tests or cutting costs the corporate reforms have failed (in fact around 2010 as this was becoming apparent these reformers changed the measure of success to a vague unmeasured aim called “college and career readiness”)(Saltman, 2012). However, the corporate reforms have succeeded in reframing public discourse about education: transforming public schooling into an individualized responsibility, upwardly redistributing educational resources, gutting public schooling for the poor, making kids into commodities by privatizing schools, and radically undermining the autonomy of teachers to link knowledge to public and critical issues and to help students theorize particular experiences and contexts in ways that would facilitate political agency and public life.

Neoliberal educational restructuring has no way of dealing with several crucial problems historically facing public schooling. Privatization such as chartering and vouchers do not challenge racial segregation and white flight in urban schooling. Instead they exacerbate segregation and naturalize an apartheid system of schooling and real estate markets. Public school reform instead ought to aim to dismantle racial, ethnic, and linguistic segregation as well as class segregation as part of a broader commitment to inclusive and equal democracy. In addition, neoliberal reforms offer nothing to challenge the legacy of radically unequal funding among public school districts. In fact, the neoliberal emphasis on “performance outcomes” not only narrows the curriculum and limits the intellectual inquiry characteristic of serious learning, but, when tied to funding as it has been in the past two decades, also punishes the poor and rewards the rich.

Title I funding that has historically been used to equalize funding was reinvented through George W. Bush’s No Child Left Behind to punish those schools and children not making standardized test score improvements. Neoliberalism’s tendency for over-emphasizing quantifiable outcomes fosters the anti-intellectualism of delinking knowledge from broader contexts, historical debates, and interpretations, while it also has a natural affinity for cultural conservative agendas that emphasize a common core of the “right” knowledge that students are to learn as dogma.

Like No Child Left Behind Obama’s Race to the Top demonstrated a perverted socialism for the rich along the lines of the 2008 financial bailouts. Billions of public dollars were dangled in front of states to induce them to expand privatized and managerialist school reform including charter schools, cash for grades, turnarounds, and other schemes. This strategy of so-called “leveraging” by the U.S. Department of Education follows the corporate playbook of the venture philanthropists and was been implemented by former staff of the Gates Foundation. Such revisions imagine historically neglected schools as private enterprises that need to be subjected to the “creative destruction” of private markets. The Trump administration bailed out corrupt for profit colleges and universities and promoted K12 privatization in the form of voucher, scholarship tax credit and charter expansion.

Still capitalizing on disaster

What is at stake in corporate school reform debates is a basic commitment to public education or a basic commitment to destroy it. Privatization advocates have made up their minds that public education has failed. The declaration of the failure of public schooling forms the backbone of the privatization agenda.

Terms such as failure, choice, and competition (as well as consumers, efficiency, and monopoly) are part of a broader long-standing neoliberal agenda that extends far beyond education: misrepresenting public goods as private consumables, replacing the collective purpose of general welfare with the misguided terminology of profit accumulation, portraying citizenship as

consumerism, and alleging that public schools need to be allowed to fail just like businesses (we should suppose this “allowed to fail” logic does not apply to banking or automobile industries). The educational policy debates remain trapped in this framing, making it difficult to assert crucial democratic educational values including equality, fairness, justice, care, intellect, and the public good, to name a few.

In 2004, Bill Gates, who has championed charter schools far more aggressively than anyone else, appeared before the National Governors Association and gave a speech, a version of which was reprinted in multiple newspaper op-ed columns. Gates stated that, “Our high schools are obsolete. By obsolete, I don’t just mean that they’re broken, flawed or under-funded, although I could not argue with any of those descriptions. What I mean is that ... even when they work exactly as designed, our high schools cannot teach our kids what they need to know.” “This is an economic disaster,” he concluded, one that is ruining children’s lives and “is offensive to our values” (Colvin, 2005). Likewise, Pete DuPont of the Lynde and Harry F. Bradley Foundation (a major funder of voucher projects) described the public school system as “awful,” the worst thing the government does in America, and as “collectivism” that could be remedied by creating a market in education, and again by treating students and parents as consumers of private education. Similarly, Bruno Manno, who has served on the board of Fordham and as a senior associate at the Casey Foundation, wrote in the Hoover Institution-published Primer on America’s Schools that “the present school enterprise is not just doing poorly, but is incapable of doing much better because it’s intellectually misguided, ideologically wrong-headed, and organizationally dysfunctional” (Cohen, 2007).

Despite the frequently heard claims about evidence-based reforms, the goal of the corporate school movement is not to improve public education; rather, it is to replace public education with a privatized national system of schools competing for scarce public dollars, regularly going out of business and allowing other profit-seekers to try their hand at running schools for profit. The privatization advocates call this “creative destruction” or “churn” and make little secret of their long-term vision.

Gates’ position has changed little. At the outset of the Covid-19 pandemic Bill Gates and Andrew Cuomo took advantage of the disaster to call for an end to brick and mortar schooling and to “reimagine education” (by handing it over to the tech sector) (Strauss, 2020). The use of the pandemic to call for market based tech reform to public education follows a longstanding pattern of using disaster to impose radical neoliberal reforms without public involvement and oversight.

In my 2007 book *Capitalizing on Disaster: Taking and Breaking Public Schools*, I showed how natural and human-made disasters are being used to implement school privatization policies that could not be put in place through standard political means. I detailed the ways that Hurricane Katrina was used to put in place preformulated plans for no-bid contracting, to expand turnaround consulting, to create the largest experiment in vouchers to date, to require data reporting from the public sector to be used by the private sector, and, most significantly, to create the largest and most aggressive experiment in dismantling an entire public school district—firing all the teachers, concentrating control over hiring of teachers and administrators under a single CEO, and replacing the former public district with a largely privatized network of charter schools.

I argued in *Capitalizing on Disaster* that what was afoot in the post-Katrina Gulf Coast needed to be understood as part of a broader trend to declare educational institutions as “failed” or as “disaster areas” to justify radical unproven experiments—specifically, radical experiments with a business approach to school reform. Rather than seeing such approaches as a marginal phenomenon, we ought to understand this as a dominant trend. The declaration of “disaster” as a reason for selling off public schools to private companies was at the core of Arne Duncan’s corporate-led Chicago school reform “Renaissance 2010” (Saltman, 2007). Renaissance 2010 closed sixty schools and opened 100 privatized, de-unionized charters. This plan was continued in Chicago since Duncan but more importantly nationalized under Obama’s administration with Duncan as Secretary of Education. As well, the educational reconstruction in post-invasion Iraq in 2003 attempted to install charter schools there with multimillion-dollar profits for educational contractor Creative Associates International Inc. These plans share a two-part process of radical disinvestment or destruction of public schooling followed by investment in privatization.

Within the neoliberal view of education, declarations of “failure” have more than one function. As a rhetorical strategy, they make it seem as though the fault for low scores has to do with the low merits of students and the underperformance of teachers rather than excessive standardization, financial pressures on school systems, overstrained parents, economic disadvantages, racial discrimination, or the over bureaucratization of knowledge and unequal distribution of cultural capital.

The neoliberal declaration of a “failed system,” which relies on the metaphor of business failure, is selectively deployed and is racially and class coded. It is not leveled explicitly against rich, predominantly white communities and public schools for which high levels of historical investment and the benefits of cultural capital (affirmation in school of the socially valued class-based knowledge tastes and dispositions first learned in the home) have resulted in high achievement, traditionally defined. Rather, the declaration of system failure is leveled against the working class and the poor, predominantly nonwhite urban communities and schools. As such, it misattributes educational inequalities and shortcomings to the public sector rather than to the private sector. In the United States, the private sector bears responsibility for school underfunding as corporations capture public wealth through tax policies while not contributing to public school funding that provides their future workforce. The neoliberal solutions actively deny the ways in which the public system has a long history of business-led engineered failure, not to mention a history of unequal resource distribution by being tied to property wealth (Shipps, 2006).

When neoliberal ideologues declare the “failure” of public schooling as potentially causing a broader economic crisis for the United States in the world, they are calling for a turn to the private sector to redress the problems that too much private sector involvement in education created in the first place. Moreover, these business tycoons and ideologues mis-represent their desire for an educated workforce where workers would compete in the global economy as a universally valuable vision rather than a class-specific one that largely benefits those who own and control capital. Such logic promotes that the public sector should

subsidize job training and job preparation for the corporate sector, but that the corporate sector should not have to pay for it through taxes. Subjugating the public purposes of public schooling to primarily that of making competitive workers for the global economy presumes that the public interest is principally served by engaging in the global race to the bottom, fostered by the neoliberal vision of trade deregulation and public sector privatization. Privatizers openly talk about US students ideally becoming workers who will compete for scarce jobs against workers from poorer nations. Values of worker discipline, docility, and submission to authority are injected into the corporate school vision as they represent the ideal of the disciplined, docile, and submissive bottom tier of the workforce. This view of the national education system, serving the interests of capital in a global economy, is at odds with the global public interest that would be better served by a critical pedagogy (Giroux).

From schooling in disaster capitalism to critical pedagogy

The US invasion of Iraq in 2003 and the chartering initiatives there, post-Katrina New Orleans and the privatizations there in 2006, Chicago's radical neoliberal restructuring and the Bush administration's signature education policy were connected by the tendency of profiteers and rightist ideologues to use disaster to declare educational failure and then impose market-based solutions such as chartering, vouchers, and no-bid contracting. Since these examples took place schooling in disaster capitalism has continued in stunningly similar form. Two of the most visible examples have been the privatizations of the Detroit and Puerto Rican public schools. Both locales suffered human engineered disaster, brutal disinvestment in social services followed by crony-connected profiteering schemes. Predominantly working class African American and Latinx citizens of Detroit, as in Chicago and New Orleans were on the receiving end of a business led plan to dispossess people of their communities and schools. Education privatizers in Puerto Rico took advantage of hurricanes Maria and Irma to close public schools and open for profit charter schools while shifting governance to private hands. The continuity of schooling in disaster capitalism owes in large part to the persistence of some of the key factors that propelled it in the past. Some of these factors include crises of capital accumulation that are being resolved through force (what Robinson calls "militarized accumulation"), neoliberal ideology, and related worsening class inequality. The privatization and corporatization of public schools is part of a sustained assault on public culture and forms of life that can nurture and sustain critical consciousness and democratic social relations. School privatizations facilitated through disaster capitalism have not only worsened racial and class segregation, they have tended to expand repressive pedagogical approaches and banking education that are antithetical to critical pedagogy and democratic educational ideals. Critical approaches to teaching and learning provide students the tools to interpret knowledge and experience in relation to broader social, cultural, economic, and political antagonisms and offer dialogic forms of teaching in which knowledge can form the basis for acts of interpretation to become acts of social intervention, agency, and collective self governance. Critical pedagogy can make schooling in disaster capitalism an object of critical analysis by comprehending the material and symbolic interests at stake in it. Critical pedagogy fosters in students the tools of social criticism and development as critical intellectual citizens who can learn to govern themselves and others, and who can deliberate on shared values beyond the shallow imperatives of consumerism and the desperate scramble for a shrinking pool of jobs.

One of the most significant aspects of disaster capitalism has been the growing existential urgency of the climate crisis and the failure of business and political elites to address it. Along with rebounding nuclear proliferation the climate catastrophe stands as the gravest threat to the continued existence of the species and life on the planet. However, the devastating effects of climate inaction will not be experienced equally. The poor who have historically contributed the least to global warming stand to be the most gravely effected by sea level rise, land displacement, and extreme weather events while the rich stand to profit from the destruction. Critical pedagogy can recognize the ongoing tendencies of elites to use disaster to achieve what are largely unpopular educational projects such as school privatization schemes, public school closures and disinvestments, mass firings of teachers and union busting, and public failure declarations. As well, critical pedagogies can link the broader politics and economics of global warming to the desperate need to transform consciousness about the urgency of environmentally sustainable practices. Critical pedagogies can relate environmental sustainability to comprehension of the utter inseparability of global warming from the capitalist imperative for profit and growth at any cost as well as the racialized dimension of the class project driving planetary destruction.

Industrial era uses of public education for capital involved a long term investment in reproducing the labor force by teaching students skills and know how wrapped in class based ideologies. This form of reproduction has partly given way to capital's use of privatization and contracting from controlling students' bodies in more direct forms (Saltman, 2016). This post-fordist trend of short term profit taking through coercion and control has become more pronounced as new technologies including adaptive learning, biometric pedagogy and AI have been used by education, media companies, and corporate philanthropies to commodify students and use them as data production engines (Saltman, 2018). The big business in repressive pedagogies is wrapped up with contracting profits as "resilience," "grit," quantified measures of "social emotional learning" and revived techniques of behaviorism, and high tech tracking and behavior modification devices continue to proliferate in schools (Saltman, 2016). The charter and philanthrocapitalist profiteers and ideologues such as KIPP, CZI, and Gates have played no small part in promoting repressive pedagogies. As well, the high stakes testing trend has been the basis for profiteering not only by test and textbook companies but by the pharmaceutical industry that sold teachers, students, and parents ADHD medications to game the tests. These new technologies of control are utterly antithetical to the aspirations of critical pedagogy. They treat learning as a performance (typified by edTPA and biometric webcam pedagogies) measured by an effect on the body rather than by fostering forms of learning through dialogue, thinking, theorizing, and mediating experience. Knowledge in these repressive pedagogies is not comprehended as meaningful for its social and political uses – the means of interpreting and acting on the social world and public problems. Rather it is

decontextualized from the social relations and broader social forces that make it meaningful and seen instead as a means of academic exchange. A crucial imperative for critical pedagogy today is to develop strategies to counter the ways that the time, space, curriculum, and pedagogy of schools has been captured by the technologies of repression that have been facilitated by neoliberal restructuring. This requires denaturalizing and politicizing knowledge, curriculum, and pedagogy in schools as well as technologies and the ideologies that they promote that often appear beyond question by being conveyed through machines (e.g. biometrics), algorithms (e.g. adaptive learning), and pseudo-scientific lingo (e.g. quantification of social emotional learning). It is imperative that critical pedagogical efforts be linked to the growing broader movements by teachers and communities to reclaim teacher autonomy and reject corporate school reform.

Another significant development in disaster capitalism has been the ways that around the world right-wing populists and authoritarian leaders have scapegoated racial, ethnic, religious, and sexual minorities and women for the structural and systemic causes of the destruction wrought by decades of neoliberal globalization. Authoritarians have revived cynical essentialist views of identity falsely equating race, ethnicity, and gender with natural essence, reviving white supremacy and retrograde stereotypes. Such identity essentialism trades in false guarantees of certainty in a time of economic and political precarity. Critical pedagogy provides a hopeful way for education to be understood as the practice of cutting through ideological mystifications that falsely position oppressed as oppressor and oppressor as oppressed. Both liberal and conservative educational discourse have created the conditions for authoritarians to seduce people to reactionary ideologies, to delegitimize science and educational institutions, and to propagate post truth relativism in which truth is only grounded in the authority of the claimant (is this not the logic of the standardized test with the maker of the test and the underlying assumptions beyond question?). By rejecting educational theory and the politics of education liberals and conservatives create the conditions for authoritarian rather than democratic culture. Liberal and conservative approaches to education reject the need for theorizing practice and instead embrace depoliticized and radically empiricist approaches to teaching that misrepresent knowledge as neutral, apolitical, and having nothing to do with broader material and symbolic antagonisms or subjective experience. In this view knowledge is not produced through dialogue, debate, investigation and curiosity but rather transmitted from “the ones who know” and deposited in the ones who don’t. On the contrary, critical pedagogy allows students to theorize and interpret not only the self as a social product, the social as constituted by class and cultural antagonism, but also knowledge and learning in relation to the social and political forces and struggles that make them meaningful. As such critical pedagogy creates the conditions for knowledge to be a source of political agency (Giroux, 2011). Despite the continuity of schooling in disaster capitalism, the development of new technologies of repression, and the resurgence of reactionary ideologies and political movements there is always the possibility of hope even in uncertain times.

Conclusion

All educational work is a form of cultural production that inevitably makes social meanings and contributes to affirming or contesting existing meanings and broader public discourses. In that sense uncertainty at the core of signification represents not a threat but an opportunity in every meaning-making encounter to contextualize truth claims in terms of broader social relations and interests, to theorize experience, and to work for education to become the basis for opposition to disaster capitalism and for broader struggles for democratic social relations in all institutions and the basis for shared learning and labor for shared benefit.

Struggles against neoliberal restructuring of education at all levels have to be comprehended as more than representational. They must be comprehended as part of a broader global struggle to expand democratic social relations throughout culture, economy, and politics and to expand the universal provision of vital public goods and services including education (ideally in critical forms), healthcare, housing, water, and food. Such struggles cannot expect or depend upon the beneficence or charity of the very people who stand to benefit most materially from the maintenance of the neoliberal order such as venture philanthropists and technology corporations and their foundations. Struggles for justice entail linking critical educational practices inside and outside of formal educative institutions and taking seriously the pedagogical and political force of cultural institutions. It also demands linking such projects to struggles for justice, equality, and freedom expressed in social movements for labor and economic redistribution, racial, gender, ecological, and other struggles for justice.

Introduction

The quality of teaching has only recently emerged as a policy priority in higher education, with some governments such as the UK even identifying it as a weakness (e.g. [Gill 2015](#)). Historically, teaching has occupied the peripheries of the policy agenda in higher education, with research the priority focus and the dominant benchmark against which to measure the quality of academics' work. High quality research and the prestige associated with it has long been regarded as the gold standard for recognizing and rewarding academic excellence, as well as having an impact on the recruitment of staff and students internationally (e.g. [Blackmore et al., 2016](#)).

In recent decades, the economization, marketization and massification of higher education have all played their part in creating an increasingly competitive environment, with institutions forced to compete against one another for students. It is in the context of this environment that the quality of teaching has surfaced as an area of policy focus, with research into teaching and students' learning having an increasingly important role to play in informing the debate, particularly in terms of research evidence being used to support teachers and their students in better understanding and ultimately improving their teaching and learning. While the vast majority of research in higher education focuses on investigating discipline/subject specific matters and is rarely concerned with researching the teaching of that discipline/subject, education research is very much an outlier in that sense. In other words, investigating the teaching of the subject as well as the subject itself is one of the key lines of inquiry of education research.

To date, politicians and education policy makers have tended to favor positivist models of experimental research design that typically consist of large-scale quantitative studies underpinned by metrics-based approaches to data collection and analysis. This has particularly been the case among policy makers globally in the context of improving the effectiveness of teaching in schools and the wider global education reform movement (e.g. [Meyer and Benavot 2013](#); [Sahlberg, 2011](#)). Such approaches invariably conceptualize teaching and learning through an instrumentalist, technicized lens, viewing them reductively as separate, linear processes with observable and measurable correlations between the input (teaching) and the output (learning). These approaches also tend to generate and/or test out performance criteria which are used to evaluate and codify the quality of teaching and learning accordingly, with an overreliance on linear systems of quantitative performance data that atomize the complexity of the teaching-learning interrelationship in a way that is not only reductionist but also decontextualized.

It is perhaps unsurprising that politicians and policy makers have favored quantitative research studies in education, as they generate data that feed models of governance and regulation that are based on what [Bamber \(2020\)](#) refers to as "metrication," which she describes as the "systemic use of metrics primarily for managerial and accountability purposes." Such systems have dominated higher education policy in recent years, where ease of management and measurement of data have become the key drivers. [Steven-son \(2017, 538\)](#) succinctly captures the current climate of education policy making and the dominance of metrics-based approaches to understanding and improving educational provision when he comments that "the measurement of everything is central to the modern educational experience." However, the fact that such approaches have become normalized and embraced by education systems worldwide neither validates their effectiveness in enhancing knowledge and practice in the field of teaching and learning nor justifies policy makers' overreliance on them. In his critique of what he refers to as the "what works" evidence-based practice movement in education, [Biesta \(2017, 316\)](#) asserts that:

While the performance of many aspects of the education system is measured in much detail and with much precision and statistical sophistication, the question that remains is whether this brings us any closer to an understanding of the value of the processes and practices that are being measured.

Building on Biesta's thinking, I would argue that not only is the question of value important to consider but so too is that of the efficacy of positivist quantitative research studies in education and their capacity to advance understanding and applied practice. The ontological, epistemological and methodological positioning adopted in this article is based on the premise that teaching and learning are not separate processes but interconnected and inform one another in a complex, nuanced and iterative way. This contrasts with positivist approaches that conceptualize the processes of teaching and learning as individualistic, performance products that can be itemized into quantifiable units.

One of the consequences of this dependence on quantitative metrics in education and indeed other public services is that qualitative data is often side-lined, seen as an additional source to the main quantitative data sets or even inferior, which not only exacerbates this reliance on quantitative metrics but actually undermines the value of qualitative data in its own right. This exemplifies what Fricker (2007) refers to as "epistemic injustice." It also reinforces Ball's argument that (2015, 299), "we are subject to numbers and numbered subjects" as a result of what he refers to as the "tyranny of numbers." It is not within the scope of this article to present an in-depth critique of the shortcomings of positivist quantitative approaches to pedagogic research and the improvement of teaching and learning. Instead, I want to focus on exploring the value of educational research as a collaborative, discursive process that seeks to illuminate our understanding of the complexity of teaching and learning in situated contexts.

As a counter narrative to the hegemony of positivist quantitative education research, this article draws on qualitative data from university teachers and students involved in two distinct yet interrelated projects focused on improving teaching and learning in higher education. The key findings from these data help to support my call for the need to move away from reductionist approaches that seek to conceptualize effective teaching and learning as linear, technical processes to be mastered and instead embrace more collaborative approaches between staff and students that acknowledge the contingent and emergent nature of the teaching-learning interrelationship.

The article begins by considering the importance of complexity and context in understanding teaching and learning and the relationship between the two. It then moves on to discussing a longitudinal body of work from two recent, interrelated research projects in higher education that adopted an innovative, inquiry-based approach to using observation as a platform for university teachers and students to collaborate on improving their teaching and learning. The article concludes by reflecting on how such collaborative approaches to researching teaching and learning can open up new opportunities for developing and informing collective understanding between teachers and students about what effective teaching and teaching looks like and how such understanding can feed into improving the experience of both.

Understanding the importance of complexity and context in teaching and learning

Complexity theory can provide a useful lens through which to view and conceptualize the teaching-learning interrelationship. Complexity theory argues that many natural and social systems cannot be captured and represented in sequential, linear relationships, as they comprise complex processes that are not only difficult to predict but equally do not lend themselves to reductive analysis or simplistic representation. In addition, complex systems are open (Cilliers, 1998), which means that their boundaries are permeable, with interactions extending beyond the confines of the sites in which they occur (e.g. classrooms, lecture theaters, virtual workspaces) and involving the wider environment. It is therefore unsurprising that teaching and learning interactions share many of the characteristics associated with complex systems. For example, the permeable boundaries of a complex system are all too apparent in teaching-learning scenarios, in person or virtually. The boundaries of real or virtual classrooms, for instance, extend beyond their spatial and temporal constituents. Besides, a multitude of external factors can potentially impact on students' engagement with learning, as indeed they can on educators' teaching.

Just as teaching and learning are part of a complex interrelationship that is made up of multiple elements, so too are they socially situated, intellectual activities (Lave, 1993). What this then means is that if we are to develop a rich understanding of teaching and learning in higher education, any such understanding needs to embody this complexity to be able to derive true meaning. As Lave's work (1988, 1993) demonstrates, meaning is inherently relational, generated in and through the interaction between teachers and their students in teaching and learning encounters. In higher education, experiences and understandings of teaching and learning tend to be shaped by disciplinary cultures and practices (Neumann, 2001). Although disciplinary knowledge is created through collective intellectual work, one of the biggest influences on academics' pedagogic knowledge and skills is often their own personal educational experiences.

Teaching in higher education is a multi-layered concept that has moved a substantial way from the traditional lecturing mode that has been associated with the sector for so long. It now typically involves a multitude of differing scenarios, sites, interactions and agents, particularly in the case of practice-based courses that incorporate work-based placements and are invariably influenced by the requirements of professional regulatory bodies. It can also be viewed and understood through multiple lenses e.g. the performance, the process and the scholarship. This is also reflected in how the relationships between teachers, students and the teaching-learning interactions orient themselves (e.g. Su and Wood, 2012). Previous research has identified traits of teaching excellence (e.g.

Skelton, 2004; Shephard et al., 2010), the most commonly occurring of which include the complex interactions and negotiations between aspects of technical, emotional and ethical deliberations. Whatever lens or focus we choose to adopt when discussing teaching, it is clear that we are dealing with a complex process that does not naturally lend itself to being neatly categorized according to an inherently reductive term like “excellence,” as it can only serve to dilute and simplify that complexity rather than attempt to capture or understand it.

In recent years, mass participation in higher education has meant that students come from a more diverse range of socioeconomic, cultural and educational backgrounds, with extensive needs, thus resulting in a highly complex teaching and learning environment. These students also bring with them their lifetime experiences of learning and their understandings of teaching and learning, which increases the importance of the need for staff to engage in ongoing development of their teaching.

To date, the way in which many universities have sought to capture students’ views on teaching and learning has tended to focus on a customer satisfaction approach of the product, rather than allowing for substantive involvement in discussions about the process and ways of improving teaching and learning. In contrast to the marketized conceptualization of students as consumers and staff as providers, which has become commonplace in higher education in recent years, this article argues that students and staff need to be viewed as members of their course community who have agency and are active participants in understanding and shaping teaching and learning in their respective communities. As Bowden and Marton (2004, 14–15) have discussed, an understanding between students and staff based on a common frame of reference of teaching and learning is fundamental to building a collective consciousness of learning in the context of their program:

Learning from other people means that we become aware of their ways of seeing things, regardless of whether or not we are convinced by, or appropriate, their ways of seeing ... this means that not only do students have to learn from teachers but teachers have to learn from students as well ... Our views of a certain phenomenon can therefore be shared or they can be complementary. Combining differing views implies richer, more powerful, ways of understanding a phenomenon or a situation and is likely to offer more options for handling varying conditions.

Viewing subject specialist learning through others’ eyes can help us to develop a mutual awareness and understanding, which in turn encourages us to appreciate, challenge and further our individual and collective understandings. Teaching and learning are social practices that require the key agents (i.e. teachers and students) to engage in a process of reflexivity. Examining our understandings and experiences of teaching and learning by cross referencing these assumptions and opening them up to dialogic exchange enables us to become aware of the strengths and areas for development in our practices. Instead of generating and cascading feedback to each other about teaching and learning, as is the norm in approaches where evaluation is the key driver, this article argues that by creating shared spaces for teachers and their students to engage in reflexive dialog, this leads to collective sense making and meaning (Fielding, 2004), as exemplified by the approach discussed below.

Research context and methodology

This article draws on a longitudinal body of work from two discrete projects, both situated in a modern English university and with a focus on improving teaching and learning. The first was an internally funded project involving academic staff working in collaborative pairs/small groups as part of a new *Cycle of Peer Observation* (CoPO) implemented in 2016/17 and which was still in place at the time of writing this article. The second was an externally funded project, *Improving teaching and learning through collaborative observation*, undertaken from 2016 to 2018 and funded by the Higher Education Funding Council for England. It comprised five case studies of undergraduate programmes across a single faculty, with each case study including small groups of academic staff and student participants. What links these two projects and their accompanying body of work is the application of observation as a shared frame of reference for participants to explore their teaching and learning experiences, to identify and discuss the critical aspects from these experiences and to reciprocally reflect on their understanding of them. In the case of the first project, this was between academic staff and in the case of the second project, this was between academic staff and their students.

Recent research in the field of observation has revealed how performative, assessment-based approaches to observation that are designed to monitor and measure teaching performance often result in counterproductive consequences in relation to improving the quality of teaching and learning and often act as a deterrent to developing innovations in practice (e.g. O’Leary, 2020; O’Leary and Wood, 2017). Learning from the drawbacks of how observation has been misappropriated as a performance management tool therefore provided an important platform for shaping the conceptual and methodological framework of both projects discussed in this article.

The observation approach used in both projects was designed to prioritize collaborative inquiry, collective reflection, professional dialog and collegial development. The starting point for this design involved a significant reconceptualization and reconfiguration of the way in which the participants would engage with observation as a method for studying and enhancing teaching and learning. A key element to overcoming some of the limitations of conventional approaches to observation was severing the link between observation and its use as a method of assessing teaching and teacher performance, as I was convinced that unless observation was removed from the assessment context, this would jeopardize efforts to capture situated examples of authentic teaching and learning and in turn to create a safe, trusting and collaborative environment for reflection and dialog between staff and between staff and students in both projects.

What follows are vignettes from each project of the conceptual and methodological design, along with illustrative examples of key themes to emerge.

Project 1 – Cycle of Peer Observation (CoPO)

Observation of teaching practice was conceptualized and applied as a common touchpoint and catalyst for dialog between pairs of teaching staff (observer and observee). The Cycle of Peer Observation (CoPO, see Fig. 1) was developed as a process to facilitate effective dialogic interaction between observer and observee. Observers were instructed to compile a descriptive log/field notes of what they observed along with associated questions and/or reflective comments to discuss during the professional dialog stage rather than make evaluative judgments. It was made clear to all staff that observers were not there to provide answers or solutions to all their questions but to support them as peers to reflect on their practice.

All observers undertook an intensive one-day observation training program and were required to organize a reciprocal observation with a fellow observer as a means of practising their skills before formally undertaking their roles. The first part of the training focused on staff discussing and critically reflecting on their understandings, perceptions and prior experiences of observation. We have since come to articulate this stage of the training as a process of *conceptual catharsis*, having learned that unless academic staff are allowed to divest themselves of prior experiences and associations with observation in an assessment context, then expecting them to engage with a reconceptualized approach is likely to be more problematic and ultimately less successful. In short, encouraging teaching staff to detach observation from assessment and embrace it as an exploratory tool requires a significant shift individually and collectively, and it is important to integrate time for this in the training.

The second part of the training provided staff with opportunities to develop an understanding of the epistemological and methodological underpinnings of CoPO, to discuss the processes of the cycle, as well as practice some basic coaching and observation skills through a series of interactive tasks. For example, they practised carrying out non-judgmental observations via a selection of video clips of teaching and compared their observation notes and reflections with their peers. This was to help to develop an awareness of what different observers notice when they observe, reflect on their values of learning and teaching and how these values inform their observations and reflections. They also practiced conducting conversations using coaching questions.

As Fig. 1 shows, there are seven stages to CoPO. Stage 1 provides the observee with an opportunity to think holistically about their teaching through self-reflective writing, encouraging them to reflect on their strengths and identify areas for further professional learning. This self-reflection is shared with the observer and forms a catalyst for professional dialog in the pre-observation meeting (Stage 2), where they have the opportunity to establish a professional rapport and explore themes articulated by the observee in their self-reflection. Where appropriate, the observer uses coaching questions to establish an ethos of inquiry as the observee articulates their chosen observation focus, and both agree the logistical details of the observation.

Stage 3 is the observation, which typically lasts about an hour. In contrast to assessment-based models of observation, observers are not required to use a proforma when taking notes as there is no checklist of behaviors or assessment criteria. They are simply asked to record what they see, with the understanding that they should avoid judgment and evaluation. Their goal is to act as “detached awareness raisers” (Whitmore, 2002, 42), a lens through which the observee can gain an additional view of the events of the observation and to use the observer’s notes as a springboard for collegial dialog.

Following the observation, individual reflections (Stage 4) are carried out by both observer and observee. The observer further develops their observation notes to add questions and comments in preparation for the post-observation meeting (Stage 5). Both bring their observation notes and Stage 4 reflections to the Stage 5 discussion and relate these back to what was discussed in Stage 2

Fig. 1 Cycle of Peer Observation (CoPO).

in terms of the agreed focus of the session. The observer draws upon non-judgmental coaching skills as they discuss the learning and teaching they experienced and observed, culminating in the observee's formulation of teaching objectives which encapsulate the learning they have taken from the observation process and steps for developing their practice.

Stage 6 requires both observer and observee to complete their reflective write-ups independently. The aim is to capture the holistic experience of both parties of the cycle, making connections between this observation experience and their past learning and teaching experiences. The observee is also expected to document the objectives identified in the Stage 5 meeting and reflect on how they intend to move their teaching forward, along with the resources/support they might need to enable them to do so. Several months after the completion of their observations, both observers and observees are invited to a focus group with their peers (Stage 7). The purpose is to move the focus away from the observation as an episodic event by creating further opportunities for dialogic professional learning as they share the insights gained and the impact these have had on both their teaching and their students' learning.

Restoring professional agency through CoPO

Establishing rapport between observer and observee is essential to create an atmosphere of trust and confidence to openly discuss and reflect on practice, particularly for colleagues who may not know each other well. Observees overwhelmingly felt that the observers achieved this; the words they used repeatedly to describe their observer's approach were "supportive," "friendly" and "professional." Echoing [Buskist, Ismail, and Groccia's \(2014, 50\)](#) emphasis on the importance of structure and planning for "intentional discussion of pedagogy," both observers and observees remarked on how CoPO provided a useful framework for focused discussion. In particular, they underlined the "vital role" of the pre-observation meeting (Stage 2) in the process. It allows the observer to clarify the purpose of the observation and to dispel any myths that may exist about the performative nature of the process. An observer from radiotherapy commented:

The pre-observation meeting has been so important in agreeing and clarifying the focus and unpicking the observee's thinking and rationale for their focus. It's been interesting how deep some of those discussions about teaching have been too.

Equally, from the observees' perspective, the pre-observation meeting "set the tone" by encouraging them to take the lead in the discussion and its focus, while also helping to establish the roles, responsibilities and expectations of each party in the process.

Observees valued the professional trust given to them. As one teacher education lecturer commented, "the fact that we have the opportunity to choose our focus and not have to pander to others' agendas is very empowering to me." Comments like this were common among observees across different data sets, reinforcing the importance of professional agency in the process and how this is valued by academics (e.g. [McMahon, Barrett, and O'Neill, 2007](#)).

The following astute remark by a nursing lecturer encapsulates the success of this project:

I specifically chose a session I wasn't comfortable with and I found this process to be much more supportive than previous experiences ... my observer wasn't imposing their view of what they consider to be effective teaching on me and I really appreciated that because I think I'm probably the best person to know how to change [my teaching] ... I just needed somebody to help me find the best way to do it.

She went on to describe how she used the observation as an opportunity to focus on an area of her teaching that she felt was "too didactic," which had previously emerged as a problem based on student feedback and a lack of student engagement during sessions. As a result of her observation discussion, she trialled more interactive teaching approaches, which were very well received by students. She subsequently went on to change all her teaching sessions to promote more interaction on the basis of her CoPO experience.

Another spoke of being in a small team who all observed each other and that "the observations generated many conversations outside of this process ... The whole ethos of the course has changed and the observation process was the catalyst for that."

Like the staff in [Tenenberg's study \(2016\)](#), observers found the process of observation, reflection and professional dialog was also beneficial to their own practice: "It was really quite rewarding as an observer; I learned more from the observee than they ever would have learned from me if I were forced into the role of trying to advise." Another said "being an observee made me reflect upon my own practice with greater breadth and question some things I do that have become unquestioned habits."

To conclude, CoPO completed its second full iteration at the end of the academic year 2017/18, with approximately 300 academic staff across the faculty having undertaken at least one full cycle. Survey results revealed high levels of engagement and satisfaction with the new approach, with 93% of observee respondents (strongly) agreeing with the statement, "The observation cycle helped me reflect on my teaching and student learning." When asked to use a slider scale to answer the question, "Was the observation process more informative/developmental or performative/judgemental?" the average rating was 92/100 in favor of informative/developmental. This was echoed in the qualitative comments of staff, with one lecturer describing it as a "genuinely democratic process that values individuals for the strengths they have, rather than an attempt to identify and criticize perceived

weaknesses” and another that it was an “incredibly positive and supportive approach to observing and reflecting on our teaching and students’ learning.”

Project 2 – Improving teaching and learning through collaborative observation

The project comprised five case studies of undergraduate programmes across a single faculty, with each case study including at least two academic staff and two student participants for each observation cycle. The five case studies included in the project were: (1) Adult Nursing; (2) Child Nursing; (3) Early Childhood Studies; (4) Primary Education and (5) Radiotherapy. As part of the Cycle of Collaborative Observation (CoCO), students and staff were all encouraged to take an active role in critically reflecting on their practices, viewing the “same” classroom experience from their perspective and exchanging their observations and reflections with each other. The project methodology was designed to draw individual perspectives together to observe teaching and learning at a course-specific level rather than focusing attention on an individual’s practice or a one-off session. Central to the project’s philosophy of improving teaching and learning was the need for students and teaching staff to take shared responsibility for developing mutual understanding, using a shared frame of reference from which to generate new understandings of situated teaching and learning situations.

The key driver for each of the project’s five case studies was to provide a platform for adopting a collaborative, inquiry-based approach for students and staff to co-investigate cognate issues relating to their respective programmes. Bowden and Marton’s (2004) “collective consciousness” was a helpful concept to consider the learning that takes places for individuals and for the case study as a collective. This concept shares the critical social constructivist stand we adopted, emphasizing how teaching and learning should be built on an ethos that challenges our taken-for-granted views and practices in order to develop new understandings and subsequently make improvements (Fig. 2).

CoCO began with two separate training sessions for staff and students, each session lasting 5 hours in total. Staff training focused on their previous experience of observations, developing an understanding of the project’s collaborative approach and discussing the stages of CoCO. They worked collaboratively on a range of immersive exercises to facilitate their familiarization with the methodology and the activities involved. While there were many similarities with the student observer training, there was a shift in focus insomuch as the students’ session was concerned with helping them to think about their position as students through the lens of learning, to reflect on how they engaged with teaching and learning and how that connected to their knowledge as a whole, as well as their experience as a student on their course.

Stage 1 of the cycle involved staff and students working with a set of prompts to compile individual reflective accounts of their learning/teaching autobiographies. Students were prompted to reflect on their prior experiences of learning and how they went about making sense of their experience as learners on their courses. Staff were prompted to reflect on their teaching and learning journeys by focusing on what their philosophies of teaching were, how these impacted on the preparation, delivery and evaluation of teaching and learning, how these connected to their philosophies of learning, and what they considered to be the relationship between teaching and learning on their respective courses.

Stage 2 *Pre-observation meetings*, students and staff first met in their peer groups to discuss their individual reflections from Stage 1 and worked together on developing their learning objectives and inquiries for their case study. Aligned with our conceptualization of learning, we adopted the term “coaching” and underpinned this with Bokeno’s (2009) work, who suggests that organizations focus on “learning relationships,” which are based upon an ethos of inquiry and a willingness to explore unasked questions. Using a coaching ethos and techniques, members in each peer group facilitated each other’s development through the use of open and

Fig. 2 Cycle of Collaborative Observation.

thought-provoking questions. The use of questions aimed to create a working ethos of enquiry and support participants in taking responsibility for their own learning.

After peer discussion, staff and students came together to share and discuss their individual reflections and to connect these reflections with teaching and learning on their course collectively. They identified the inquiries they wished to investigate together, agreed the focus and dates of the observed sessions, the roles of each member during the course of the cycle and the expectations of both parties. The focus of the discussion was on teaching and learning rather than the teachers/students. This was where, for the first time during CoCO, the two sets of lenses came together to co-interrogate teaching and learning.

The observation (Stage 3) involved students working in pairs to observe part of the session from their perspective as learners. A lecturer led the session while the other observed. Students and staff agreed their focus prior to the observations. To ensure that they were able to carry out high quality observations with limited distractions to their learning during the session, it was recommended that each individual student limit their observation time to 30 minutes. Observers took handwritten notes with no prescribed criteria on what to observe. Following the observation, *immediate reflections (Stage 4)* were carried out by all participants individually. Each observer then developed their notes, supplementing them with questions and comments in preparation for their post-observation meetings.

Stage 5 post-observation meetings took a similar format to stage 2. Students and staff met in their peer groups to discuss their observation experience and relate what they had observed to their own learning/teaching experience on the program. When meeting as a group, all participants brought their notes and reflections to the discussion and linked these back to the stage 2 discussion and the agreed learning objectives and focus. Each individual's perspective came together to form a collective understanding of the shared classroom teaching and learning they had observed and experienced.

Stage 6 of the cycle culminated in a *reflective write up* by each participant independently. The aim was to capture the holistic experience of both parties of the cycle. What's more, each participant was prompted to make connections between this observation experience with their past teaching and learning experiences and their current teaching and learning experiences across the course.

Over the course of the two iterations of CoCO, each case study produced a large volume of rich data, which included initial reflections from all student and staff participants, recordings of the pre- and post-observation meetings, observation field notes, individual reflective write-ups and recordings of evaluation meetings with the project researchers at the end of each cycle of observation. The thematic discussion that follows is drawn from an analysis of these data.

Developing classroom consciousness between students and staff

In Cycle 1, each case study focused on understanding the impact of teaching on student learning, exploring key aspects of teaching such as pedagogical approaches, the classroom environment, resources etc. The lecturers decided the focus of the observations and led the discussions during the pre- and post-observation meetings. One of the outcomes to emerge from Cycle 1 across each case study was the development of students' understanding of the relationship between learning and teaching. While Cycle 1 observations focused largely on teaching, the experience of collectively observing, discussing and reflecting on learning and teaching on their respective courses resulted in the unearthing of their classroom consciousness, as the following extract from Katie's (Radiotherapy student) end of cycle reflection illuminates:

The student observer process so far has been extremely insightful and made me think in more depth why lecturers do things in the techniques they do. It has made me understand that one technique is not suitable for all aspects of my course; for example being taught anatomy purely through PowerPoints and books would be extremely difficult to absorb and would not put the knowledge in to context however the human models and practical tasks gave a more natural way of learning.

One of the significant developments to occur across all case studies moving from Cycle 1 to Cycle 2 was the collective decision to shift the observation focus from teaching to learning. This shift in focus emerged as a suggestion during a project review day involving staff participants at the end of Cycle 1. After reading and discussing reflections by students, staff were keen to empower their students to take more responsibility for deciding the foci of Cycle 2 observations. This was then later agreed between staff and students in their respective case study meetings before starting Cycle 2.

Compared to Cycle 1, this shift in focus marked a key milestone in the project, leading to a greater depth of reciprocal awareness and understanding of classroom learning and teaching among students and staff. Across the case studies, it gave rise to a more even balance in the discursive interaction between participants. This was not only reflected in an increase in student talking time in Cycle 2 meetings compared to Cycle 1, but also in the depth of their critical thinking and reflections on learning and teaching.

In her work on the scholarship of teaching and teaching excellence, Kreber (2002) refers to a conception of teaching that is "learning oriented." We found this a helpful term and concept to explore the significance of this shift in focus from Cycle 1 to Cycle 2. Learning was placed at the forefront of all discussions in Cycle 2 with students encouraged to reflect on their experiences, views and feelings. As Jay (Adult Nursing student) commented, "this cycle is a lot better, because it's just us, isn't it? So, we can just focus on us, our learning and if everybody individually focuses on themselves, we've got something to put together and collaborate on." Both Jay and his peer Oliver agreed that focusing on their own learning in Cycle 2 "felt more natural" compared to having to discuss and evaluate their lecturers' teaching (as they did in Cycle 1 observation), which Jay maintained they were "not qualified to judge."

Jay and Oliver's perceptions were representative of their peers in the other case studies inasmuch as the shift to a learning-oriented focus also helped to remove some of the apprehension they felt in their roles as observers of their lecturers' teaching. For the lecturers, because the focus was driven by students in Cycle 2, this provided them with rich and timely insights into their students' learning. For example, in Radiotherapy where the Cycle 2 focus was on classroom dynamics, Nick (lecturer) highlighted how his participation in CoCO had made him reflect on the "social aspect of the classroom," triggering novel perspectives on his students' learning:

The most useful thing about this observation project to me is just working out the social aspect of the classroom. I've never had time to stop and think about it before... I don't remember having conversations about it when I was taught how to teach.

While the observation training for both students and staff emphasized how the observer's role was not to evaluate the teaching but to use observation as a tool of collaborative inquiry through which to explore teaching and learning, the focus on teaching in Cycle 1 meant that discussions often gravitated toward assessing the effectiveness of teaching. With the focus on learning, both parties were able to derive value that fed into their wider classroom consciousness of their learning/teaching and the relationship between the two. Stacey (Child Nursing student) remarked: "I think that was a good thing because it's made me reflect more on myself and where I'm learning and what my learning is and am I learning?" Nick (Radiotherapy lecturer) commented: "The feedback I want is 'does this make your practice more relevant?' It's not the process of being observed, it's the whole context of being observed."

Analysis of the transcripts from the meetings across both cycles revealed a development of confidence and fluency among the student participants in their discursive exchanges and the manner in which they were able to articulate their thoughts. However, it is important to acknowledge that this may also have been partly due to the development of the student-teacher relationship as each group got to know each other better over the duration of the project.

Building collaborative relationships between students and staff

The relationships between the participants in each case study were critical to their collaborative learning. What brought the participants together were their interests in learning and teaching and a desire to work together to develop individual and collective understandings of learning and teaching on their respective courses. The mutual interests in pedagogy and learning in each case study team were what formed this meaningful bond. Oliver (Adult Nursing Student) in his end of Cycle 2 reflection commented on what this pedagogical connection with his lecturers and his peers meant to him:

The major benefit I've taken away is the chance to have an informal meeting with the people providing my education and an entire hour set aside to talk about my experience. I was both contributing to and benefiting from the best part of a new model of student-teacher collaboration. It felt like a team-based approach, and I had Jay as my constant peer and colleague to give me a chance to listen to the way other students experience, perceive and evaluate the same things I have.

The social relationships across case studies included the formal roles and commitments participants had as students and lecturers in their respective courses, as well as their personal commitments to their collaborative partnership. Each participant took their formal role and commitment seriously in observing, questioning, critiquing and developing situated pedagogical practices in their classrooms. Besides, the nature of the collaborative partnerships seemed to yield more substantive personal connections between them. For the students, this was a new and different kind of relationship with their teachers, as Oliver explains during the pre-observation meeting with his lecturers and fellow student:

I know that you are obviously human, but when you're a student and you're sitting in front of a lecturer, sometimes it's that barrier of "I'm a student they're a lecturer" whereas all of a sudden when there's personal stories that come into it and their own little phrases and the way that they explain things, that adds to the idea that this is more of a peer relationship. We get more from that relationship than you would from just lecturer and students.

Students and staff clearly valued this personal connection with each other. Following on from the learning oriented lens (Kreber, 2002) discussed in the previous section, it is useful to draw on Rogers' work (2002) on interpersonal relationships in education to delve deeper into the nature of such personal connections. Rogers' conceptualization of learner-centered education provides a useful frame of reference for situating the discussion about the relationship and orientation between learning and teaching.

From the beginning of CoCO, a gradual process of familiarization unfolded between the participants. Cycle 1 interactions between staff and students started by focusing largely on procedural and technical aspects of observation. As the relationships developed, staff participants in each case study began more openly to share their insights on teaching (e.g. their pedagogical reasoning) and their assumptions of learning. This openness enabled the establishment of authenticity in the pedagogical relationships

between participants. As Rogers (2002) observed, this means that teacher and learner are able to enter interactions being themselves, with a heightened awareness of their feelings and views. This is clearly reflected in Oliver's comment above and similar remarks from other students. In particular, this meant students were able to see teaching not just as a job their lecturers do as a "curriculum instructor" (Rogers, 2002) but as decisions and actions carried out consciously and deliberately by a person who has shared educational interests with them. As the lecturers became more open about their practices and views, this was reciprocated by the students who were candid in sharing their opinions and feelings. This authenticity provided a platform for students and staff to engage in an open inquiry of learning and teaching. As discussed above, one of the principles of CoCO is that participants exchange their views and listen to others without judgment. Building and maintaining the realness of the pedagogical relationship between students and lecturers meant both parties were disposed to exchanging personal feelings and views, acknowledging the different perspectives of others and learning from each other, leading to a collective enhancement of classroom consciousness.

Rogers (2002) highlighted how this kind of understanding and acceptance differs markedly from evaluative approaches that focus on a "what works" methodology (Biesta, 2017) in teaching and learning. For Rogers (2002, 30), a sensitive empathy develops in pedagogical relationships that are built on realness and acceptance, which then enable students to feel "at last someone understands how it feels and seems to be me without wanting to analyze me or judge me. Now I can blossom and grow and learn." Rogers' work focused on the impact teaching had on learning and he saw the nurturing of such relationships as the responsibility of the teacher. In our project, both students and lecturers embraced this responsibility. As a result, a shared empathy emerged where students and lecturers developed a reciprocal awareness and understanding of the processes of learning and teaching in their classroom and how these are experienced from each other's perspectives. Reflections by Aneesa (student) and Ilana (lecturer) from Child Nursing illustrate the power of such shared understanding in developing their classroom consciousness and pedagogical practices:

This reflective cycle has enabled me as a student to work in collaboration with Ilana and Nathalie whereby we were all equal participants in research. This relationship has given me an incomparable insight into how much preparation and time goes into teaching and has encouraged me to make the most out of the lectures. I now have a better understanding of how I can benefit from different methods of teaching (Aneesa).

Participating in the process has impacted my teaching on a practical level. More importantly I've gained a deeper, shared understanding about learning and teaching as a result of the collaborative meetings with the students. This observation unlocked the potential for us to understand our students and thereby allowing us to meet their learning needs on a deeper level. However, learning still does depend on the students' willingness to participate in the process. By allowing students to become more aware of their own learning as a result of their participation in observation, consequently led to them being empowered to overcome self-identified barriers and leading to a better and more satisfactory teaching and learning experience for all. By enabling students to participate in the collaborative observation cycle, change does not only happen on one-dimensional level "teacher growth," but becomes a multi-dimensional change by enabling "student growth" and "teacher-student growth"

(Ilana).

CoCO played a critical role in facilitating this dialectic relationship development. For each participant, the individual reflections at the beginning and end of the cycle gave them the space to develop their autonomous voices. In their reflections, each participant talked openly about their experiences and reflected on them which triggered their questions on teaching and learning. When the participants came together at the pre- and post-observation meetings, they used their voices to negotiate and build the interconnecting part of their collaborative inquiry. In our project, as a shared point of reference, CoCO created the conditions for this dialectic relationship to flourish.

Concluding thoughts and future directions

It is highly likely that by the time this article is published, the world will have succeeded in controlling the Covid-19 pandemic and a sense of normality will have been restored to all walks of public life. In the case of education, however, it would be an opportunity missed if we were simply to return to the linear systems of quantitative performance data and reductionist approaches to learning about and improving teaching and learning that have dominated education internationally in recent years. Such systems and approaches serve to perpetuate the status quo of the "what works" movement, which in turn closes down alternative ways of knowing and doing. Context clearly matters and it is important to acknowledge the implications of this from a methodological perspective and the subsequent application of any research findings.

What the two projects discussed in this article reveal is that effective teaching and learning occurs as a result of sustained, personal and professional learning that involves critical reflection and ongoing negotiation of meaning and understanding between those involved in this interrelationship. This process is often unique to individuals and as such requires a tailored approach. Besides, teaching and learning and their interrelationship are inherently qualitative in nature and as such require appropriate methodologies and methods to explore, interrogate and make sense of these complex phenomena. As Strom and Viesca (2020, 13) argue, "research activity needs to be situated and local, with a focus on the particular."

An important finding to emerge from this body of research is that teachers and students learn about teaching and learning by interacting with their peers and with each other, by sharing their insights and experiences in collaborative, cooperative forums. In other words, teaching and learning are inherently socially situated practices. It therefore makes sense that any attempt to enhance understanding of and improve these practices is best served by allowing its key participants to be part of a collective community in which they are encouraged to engage in a process of dialectic pedagogical knowledge and relationship development. Creating the conditions in which teachers and students have the opportunity to examine their understanding and experiences of teaching and learning and open them up to dialogic exchange is fundamental to developing greater awareness of the strengths and areas for development in their practices. In the context of teaching and learning, approaches like CoPO and CoCO can help to create the shared spaces in which teachers can come together with their peers and equally with their students to engage in reflexive pedagogical dialog on their classroom teaching and learning. In turn, this can lead to collective sense making, which can make a valuable contribution to both students and their teachers in understanding and developing their practices.

Introduction: student-faculty pedagogical partnership

While teaching and learning are often conceptualized as distinct processes undertaken by differently positioned participants in higher education, student-faculty pedagogical partnership enacts and supports reciprocity in teaching and learning—positioning both students and faculty as both teachers and learners. A widely cited definition of pedagogical partnership is “a collaborative, reciprocal process” through which “all participants have the opportunity to contribute equally, although not necessarily in the same ways, to curricular or pedagogical conceptualization, decision making, implementation, investigation, or analysis” (Cook-Sather et al., 2014, pp. 6–7). Key to this definition is the phrase “not necessarily in the same ways”; indeed, it is the different experiences and perspectives each participant brings and the different ways in which participants contribute, all equally valued, that position faculty and students in student-faculty partnership as both teachers and learners.

Scholars have developed multiple typologies to classify forms of partnership work, all of which focus directly or indirectly on teaching and learning. A frequently referenced typology focuses on arenas of engagement: (1) learning, teaching, and assessment; (2) subject-based research and inquiry; (3) scholarship of teaching and learning; and (4) curriculum design and pedagogic consultancy (Healey et al., 2016). Another typology classifies partnership work in terms of student partner role: (1) consultant: sharing and discussing valuable perspectives on learning and teaching; (2) co-researcher: collaborating meaningfully on teaching and learning research or subject-based research projects with faculty and staff; (3) pedagogical co-designer: sharing responsibility for designing learning, teaching and assessment; and (4) representative: ensuring student voices contribute to decisions in a range of university settings (Bovill et al., 2016). Yet another typology offers a participation matrix keyed to level of student involvement across different activities traditionally considered the sole purview of faculty (such as course design or project evaluation): inform, consult, participate, partner, and control (Bovill, 2019; see also Bovill, 2017).

Reciprocal teaching and learning through student-faculty partnerships directly focused on classroom practice can be distinguished by location of the student partner in relation to the teaching and learning practice: as enrolled or involved in it, or as positioned in a liminal role outside it. The former, which Bovill (2020) calls whole-of-class co-creation, is often undertaken with the goal of democratizing classroom practices (Bergmark and Westman, 2016; Cook-Sather et al., 2014) and “may be inherently more inclusive of students” (Bovill, 2020, p. 1023) since all students are involved. The latter kind of partnership work positions students outside the standard teacher-student power dynamic (Cook-Sather and Alter, 2011), fosters engagement in respectful dialog (Cook-Sather, 2020) and generation of more candid feedback (Cook-Sather, 2009), and affords students a rare opportunity to mobilize their

identities to foster change for equity, inclusion, and culturally sustaining practices (Bell et al., 2020; Cook-Sather and Agu, 2013; Cook-Sather et al., 2019a,b,c) from less central, but therefore sometimes more powerful, positions (Cook-Sather, in press).

Student-faculty pedagogical partnership work that both enacts and fosters reciprocal teaching and learning is rapidly expanding around the world. There are established programs in Aotearoa/New Zealand, Australia, Canada, England, Israel, Pakistan, Scotland, Sweden, and the United States through which teaching and learning centers or institutes support student-faculty pedagogical partnership across the institution. There have been pilot efforts in Grenada, Hong Kong, Italy, Malaysia, Norway, and Singapore through which individual faculty members have invited students to contribute to curricular or pedagogical conceptualization, decision making, implementation, investigation, or analysis. And there is growing interest in China, Germany, and The Netherlands in such work. For instance, a scoping review of partnership work in Asia reports on the literature from China, Hong Kong, Singapore, and Malaysia through the lens of the power dynamics that inform student-teacher relationships, particularly in Asian contexts (Liang and Matthews, 2021).

This entry provides an overview of various aspects of reciprocal teaching and learning through student-faculty pedagogical partnership work in higher education. It first reviews the reported outcomes of this work. Next, it reviews the core values that guide pedagogical partnership work, emphasizing that how those values are enacted depends on context and evolves as partnership work spreads around the globe. Turning to a practical aspect of supporting student-faculty partnership, the entry summarizes multiple approaches to facilitating partnership work. Then, stepping back from outcomes, values, and approaches to facilitation, the entry identifies the challenges of partnership work. It concludes by suggesting future directions for reciprocal teaching and learning not only in classroom-focused student-faculty partnership but also in conceptions of educational development and scholarship of teaching and learning.

Consistent outcomes of student-faculty pedagogical partnership

There have been numerous, cross-context analyses of the outcomes of student-faculty pedagogical partnership that look back over a decade of such partnership (e.g., Cook-Sather et al., 2019a,b,c, 2014; Mercer-Mapstone et al., 2017). The positive outcomes of this work are remarkably similar across context. Students consistently experience:

- Heightened engagement in, motivation for, and ownership of their learning
- Increased confidence, self-efficacy, and sense of agency
- Deepened capacity to articulate their own perspectives
- Deeper understanding of others' experiences (both teachers' and students')
- Enhanced relationships with or trust of faculty and other students
- Deeper understanding of themselves as learners and their own learning processes (metacognitive learning, self-evaluation, self-awareness)
- Raised awareness and enactment of graduate attributes/employability skills/career development
- Increased sense of belonging to university or discipline or community
- Improved student content/discipline learning (actual or perceived)
- Positively shifted identity as student/learner/person/professional
- Deeper understanding of and appreciation for the difficult work of teaching and greater empathy for teachers

Revealing some of the same experiences as those reported by students and some different experiences, faculty consistently report:

- Accelerated processes of acclimating to campus culture and unfamiliar students
- Deepened confidence and clarity about their pedagogical commitments
- Courage to follow through on their pedagogical convictions and responsibilities
- Gaining a perspective that they cannot achieve on their own
- Recognizing and making intentional good pedagogical practices
- Discovering the benefits of sharing power—and responsibility—with students
- Enhanced relationships with or trust of students and other faculty
- Development of new or better teaching or curriculum materials
- Deeper understanding of others' experiences
- New beliefs about teaching and learning that change practices for the better
- Re-conceptualization of teaching as a collaborative process to foster learning

There are also negative outcomes of student-faculty pedagogical partnership, though these are less common and also less frequently reported. Among the negative outcomes for students are feeling:

- Unproductively vulnerable to faculty partners or traumatized by a partnership
- Frustrated with non-partnership frames and practices in other contexts (after having experienced partnership) and in partnerships that do not realize their potential
- Hyper-responsible as a result of increased awareness and capacity
- Disenchanted with non-engaged work

Among the negative outcomes for faculty are:

- Feeling unproductively vulnerable to students and others—at risk or exposed
- Experiencing initial resistance and dismissal
- Rejecting the partnership approach

A growing body of scholarship that brings an equity frame to the processes and outcomes of partnership work emphasizes that if partnership is not carefully conceptualized, structured, and revised as needed, it can exacerbate the epistemic, affective, and ontological harms many students experience in higher education (de Bie et al., 2019, 2021). Such work documents the harm that indigenous students (Yahlnaaw, 2019), mature-aged students (Vayada, 2021), international students (Colón García, 2017), students of color (Ntem and Cook-Sather, 2018), and students from other equity-denied groups can experience in partnership when certain, particularly Western, notions of who has and can create knowledge about teaching and learning (Bindra et al., 2018) and overly goal-driven (rather than emergent) approaches are privileged.

The outcomes for students and faculty of student-faculty pedagogical partnership affirm the reciprocal nature of the teaching and learning fostered by this work. The clear pattern of each participant gaining deeper insight into the other's experience and contributing to the learning of the other, as well as the potential for unproductive vulnerability and harm, highlight two sides of such relational work. Through enacting and supporting reciprocal teaching and learning, partnerships can lead to deeply meaningful experiences from which to learn more about one's self, others, and teaching and learning.

Partnership values

As partnership work was initially emerging, primarily in the United States and the United Kingdom, scholars identified three core underlying values of partnership practices: respect, reciprocity, and shared responsibility (Cook-Sather et al., 2014). Respect is an attitude: a valuing of others' experiences and perspectives. Reciprocity is both an ethic and a mode of engaging—a “process of balanced give-and-take not of commodities but rather of contributions: perspectives, insights, forms of participation” (Cook-Sather and Felten, 2017, p. 181). And shared responsibility is both a process (during partnership) and an outcome of partnership. To these values, Healey et al. (2014) added authenticity, honesty, inclusivity, empowerment, trust, courage, and plurality.

As partnership work has expanded to other regions of the world, scholars and practitioners have recast and revised these core values. For instance, feminist scholars in the United States have recast the values of respect, reciprocity, and shared responsibility as agency, accountability, and affinity (Cates et al., 2018), and drawing on partnership work in England, Aquarone et al. (2020) emphasize the value of recognition. Student partners in Australia have added vulnerability to the list (Matthews, 2021; Vayada et al., 2020), and student partners in the United States highlight the value of affirmation (Ntem, 2016; Jonsson, 2020). A cross-context set of perspectives of 20 students, faculty, professional staff and administrators in Aotearoa/New Zealand, Australia, Canada, England, Pakistan, Singapore, South Africa, the United States, and Wales offered in response to the question “What does successful partnership mean to you?” surfaced the following values that are consistent with arguments offered in partnership literature: promotes shared ownership, decision-making, and mutual benefits; joins distinct but complementary perspectives and attends to unique needs of partners; pushes comfort zone, challenges norms, and asks new questions; differentiates between process and outcome, which requires ongoing sustained work; and promotes adaptability and responsiveness (Cook-Sather et al., 2021b).

As partnership work expands beyond the largely Western contexts in which it originated, scholars and practitioners are wrestling with how the originally identified core values, often evoked to launch partnership initiatives, intersect with core values in a range of contexts. For instance, in relation to Asian contexts, Liang and Matthews (forthcoming) argue that “Confucian educational values,” which have sometimes been evoked as a barrier to partnership in Asian contexts, are “compatible with the contemporary values evoked as the guiding ethos of student partnership” and “can inform the implementation of [partnership work] in China and Asian universities.” In striving to reconcile and revise Western partnership values with non-Western values, scholars have explored cultural phenomena such as: negotiating student deference to authority and a focus on grades rather than growth and learning (Seow, 2019), issues of face (Sim, 2019), and conceptions of students as clients, customers, objects, products but not (yet) partners (Chng, 2019) in Singapore; dichotomies between teachers and students that value student deference to faculty authority in Malaysia (Kaur, 2020); valuing confidence and active participation in a Pakistani context in which students do not typically have a voice (Ansari, 2021; Iftikhar, 2021; Waqar and Asad, 2020); and cultural norms across contexts according to which students engaging in dialog about teaching and learning with faculty is simply neither an established value nor a practice (Liang and Matthews, 2020; Felten et al., 2019; Kaur and Yong Bing, 2020; Moorhouse and Oh, 2019).

The definition of partnership as supporting participants in contributing “equally, although not necessarily in the same ways, to curricular or pedagogical conceptualization, decision making, implementation, investigation, or analysis” (Cook-Sather et al., 2014, p. 7) highlights that partnership practices are defined by reciprocity. Such practices require and inspire an ongoing commitment to identifying and re-examining values that underpin the partnership work guided by an awareness of the potential for all the desired benefits and equally of the risk of conflict and harm.

National, institutional, disciplinary, and individual influences on approaches to partnership

The nested contexts of and participants in student-faculty pedagogical partnership work influence how it is conceptualized and how it unfolds (Cook-Sather and Wilson, 2020; Healey and Healey, 2018). The “Ako in Action” program at Victoria University of Wellington, for instance, offers an example at the intersection of national and institutional considerations and participant identities. Aotearoa/New Zealand is a bicultural country, and it is home to Māori, settlers of European descent, and peoples of Asian descent. Victoria University of Wellington, a research-intensive university with approximately 22,000 students in the country’s capital city, houses a student-faculty pedagogical partnership program that was developed in the context of “a new Learning and Teaching Strategy that embedded a bicultural approach to learning and teaching” adopted by the university in 2017. This approach was built on the principle of “*‘ākoranga*,” a Māori term that means both to teach and to learn.” This principle is enacted at the university as “a ‘collective responsibility for learning,’” and the partnership program at the university was “co-conceived, designed, and coordinated by students and academic (faculty) developers” (Leota and Sutherland, 2020, p. 93.)

The student-faculty pedagogical partnership program at Kaye Academic College in Be’er Sheva, Israel, provides another example of the intersection of national and institutional considerations and participant identities. Kaye Academic College focuses on the preparation of primary and secondary teachers and serves approximately 2000 students from both the Jewish and Bedouin sectors of the Negev region of the country. Many of the students “are the first generation of their families to attend higher education ...; many come from marginalized populations ...; very few have English as their mother tongue, indeed for many students in the English teacher-training department, where English is the medium of instruction, English is often their third or fourth language” (Narkiss and Naaman, 2020, pp. 42–43). Considering how to name one of the key commitments of partnership, respect, is complicated in this program because the word “respect” can evoke hierarchy rather than collaboration. In a context like Kaye as an institution and Be’er-Sheva more broadly, with many different ethnic groups who have differing words for and understanding of words like respect, they use the term “*kavod*” to express several English concepts including honor, respect, dignity and esteem (Judith Zamin, Personal Communications, October 24 and October 25, 2019). More challenging still is structuring partnership such that it feels welcoming for Bedouin students and is responsive to their ways of being. Many of these students live according to clan values and structures based on blood and extended family connections and strict loyalties (informal conversation with colleagues at Kaye). These do not easily fit with the cross-role, reciprocal, and critical dimensions of pedagogical partnership as it is typically conceptualized in Western contexts.

Stories of pedagogical partnerships from around the world reveal how partnership develops not only in national and institutional contexts but also at the intersection of disciplinary norms and participant identities, drawing in reciprocal ways on each partner’s identities and commitments. For instance, a female, Nigerian, graduate student in gender studies and feminist research working in partnership with a female, white, faculty member in engineering in a Canadian university drew on her own family’s background in engineering as well as her belief in the potential of “radical pedagogy that centers students from minoritized groups” to design a new engineering course on Inclusion in the Engineering Workplace (Chukwu and Jones, 2020, p. 14). These partners reflected on how, through the partnership, they both “learned and grew, and benefited from one another’s disciplinary expertise” (Chukwu and Jones, 2020, p. 20) and how, in particular, working across disciplines “made it possible to circumvent the faculty-student power dynamic to some extent” (p. 16) and create “a productive and truly equitable partnership” (p. 20).

As another example, the Medical Humanities curriculum, a compulsory part of the Bachelor of Medicine, Bachelor of Surgery program at the University of Hong Kong, was developed to support doctors who are working in “technologically advanced, difficult and emotionally charged conditions” learn to be “more humanistic towards both their patients and themselves” (Chen and Ho, 2020, p. 21). The student and faculty pair who worked on developing this curriculum brought both personal and professional perspectives to bear—the loss of a parent, the established emphasis on interpersonal and communication skills in the curriculum. Through this partnership, the faculty member became much more aware “of the interrelationship between formal curricular initiatives and the learning environment, culture, or social setting in which students are immersed,” and the student partner found that “pedagogical partnership encourages mutual ownership and encourages active contribution” that can contribute to “satisfactory and sustainable changes and learning outcomes” (Chen and Ho, 2020, p. 27).

As yet another example, a student and faculty partnership in Malaysia developed through the collaboration of a female, Indian-born, visiting faculty member and a male student from a minority community in Malaysia. These two worked together on a psychology course to “transform traditional one-way and hierarchical pedagogical methods” typically embraced in the Malaysian context and “pave ways for pedagogical methods that are co-constructed with students” (Kaur and Yong Bing, 2020, p. 70). The student partner’s contributions provided his faculty partner with “a window into students’ hearts and minds” and brought to her attention things that she “might have ignored otherwise” (Kaur and Yong Bing, 2020, p. 67). At the same time, the partnership work built the student partner’s confidence and helped him “come to believe that a teaching and learning paradigm shift could be achieved ... through teacher-student partnership” in his cultural context (Kaur and Yong Bing, 2020, p. 68).

This is a small sample of the growing number of partnership efforts around the world. All of these efforts unfold within and beyond power dynamics and prescribed roles that are structured into institutions, even as they strive to be attentive to context and responsive to participants. All are doing so through the “as-if” spaces that partnerships create (Cook-Sather and Felten, 2017), providing participants liminal spaces within which to explore, try out, and carry forward reciprocal teaching and learning.

Models of partnership facilitation

There are many approaches to supporting reciprocal teaching and learning through student-faculty pedagogical partnership. The best documented of these include teaching and learning center-based forms of facilitation; the integration into the pedagogy of whole-of-class student-faculty partnership practices; and various approaches to facilitation of partnership approaches supported by liminally positioned student partners.

Center-based forms of facilitation

Academic developers can play a key role in supporting the complex, relational processes of partnership; fostering and advocating for institutional or structural change to address resistance; and focusing on the potential of partnership to make institutions more equitable and empowering spaces (Matthews et al., 2019). Existing forms of center-based approaches include the creation of teams of students, faculty, and teaching and learning center staff who focus on revision of a course and related pedagogical practices, and the bringing together of larger groups of practitioners of student-faculty partnership work to share practices.

The creation of teams of students, faculty, and teaching and learning center staff

This is the approach taken through Elon University's Center for the Advancement of Teaching and Learning. The first iteration of this approach provided the model: two faculty members, the center director, and seven students participated in a Course Redesign Design Team to redesign an education course (Delpish et al., 2010). This approach "not only produced an effective new course (as seen in the higher evaluations than in previous terms), but also produced significant learning for everyone on the team" (Delpish et al., 2010, p. 126)—reciprocal teaching and learning in team-based curriculum redesign. Other institutions, such as University College London in England (Quy et al., 2020), have developed variations on this approach not only for courses but also for entire departments and programs. Such an approach helps "access multiple perspectives" (Quy et al., 2020, p. 82) in developing and revising educational structures and practices.

Bringing together practitioners of student-faculty partnership

A kind of "middle-out" model brings practitioners together to share the diverse range of partnership practices in which those practitioners engage. Such an approach builds community and affirms and further develops practices. For instance, at the University of Queensland (UQ) in Australia, the UQ Students as Partners Community of Practice "creates space for staff [faculty] and students to explore, share, and improve partnership practices together to positively transform teaching, learning, and the student/staff experience" (Khoury et al., 2017, p. 3). This program is open to all UQ students and faculty, and participants meet every six weeks with the goals of sharing experiences, advice, and resources about partnership work; supporting each other in undertaking and enhancing partnership work; networking and fostering collaboration between community members; and influencing policy and practice at UQ. This model might be useful in contexts in which participants do not have structured programs or funds to support those who are keen to practice partnership both formally and informally.

Whole-of-class facilitation

Facilitation of whole-of-class student-faculty pedagogical partnership typically involves the faculty member communicating with students prior to or early in the semester about the reciprocal teaching and learning approach they plan to take in the course, inviting student input on that approach, and structuring student engagement in that approach (Bovill, 2020; Bryson and Callaghan, 2021). In this model, facilitation is part of the pedagogy of the course. Faculty have invited students to: co-create curriculum with the goals of democratizing class practice (Bergmark and Westman, 2016) and catalyzing new professional partnerships that in turn contribute to refreshed learning experiences and communities (Cates et al., 2018); co-create assessment with the goals of challenging power dynamics in assessment and developing assessment literacy (Deeley and Bovill, 2017; Deeley and Brown, 2014; Goldbold et al., 2021; Monsen et al., 2017); and embracing and enacting anti-racist pedagogical approaches (Wilson and Cook-Sather, in press).

Approaches to facilitation of partnership approaches supported by liminally positioned student partners

Across different contexts and institutions, varying models of facilitation of partnership approaches supported by liminally positioned student partners—students positioned in partnership roles outside the standard teacher-student roles, power dynamics, and institutional relationship—have been employed. These models include: facilitation by a single faculty/staff member; co-facilitation by a pair of faculty/staff members; co-facilitation by a faculty/staff member and a post-baccalaureate fellow; co-facilitation by staff members and student partners; and facilitation by a single student.

Facilitation by a faculty or staff member

One of the most common approaches to facilitation has a faculty, staff member, or center director serve as facilitator. In this case the role may be compensated by pay or release time from teaching for a faculty, pay or reassignment of responsibilities for a staff member, and assignment as part of a center director's responsibilities. This is the approach taken at a wide range of institutions, including Lahore University of Management Sciences in Pakistan, Kaye Academic College in Israel, and numerous small private colleges in the United States, including Bryn Mawr and Haverford, Reed, and Smith Colleges. Those choosing this model of

facilitation are advised to consider how to implement it with sensitivity to context since this approach can either fit within or build beyond existing institutional structures (see [Cook-Sather et al., 2019a,b,c](#) for detailed guidelines for this approach.)

Co-facilitation by a pair of faculty/staff members

Another approach involves two faculty or staff members co-facilitating. This is the approach taken at Florida Gulf Coast University in the southern region of the United States, a public university and Hispanic-Serving Institution, at Yale University, a private research institution in the northeastern region of the United States, and at Amherst and Ursinus Colleges, two private liberal arts college in the northeastern and Mid-Atlantic regions, respectively, of the United States. The different institutional positions and disciplinary backgrounds such co-facilitators bring to facilitation contribute different insights and lead to different emphases ([Reynolds et al., 2019](#)). This approach affords both facilitators and student partners the benefit of having two experienced educators who bring different perspectives to their facilitation and who model reciprocal teaching and learning as facilitators.

Co-facilitation by pairs or teams of staff members and students

At several institutions, support for pedagogical partnership work is provided by pairs or teams of staff members and students. This approach has been implemented with staff and undergraduate students as facilitators at Vassar, a small liberal arts college in New York ([Bala, 2021](#); [Bala and Kahn, 2021](#)), and Tufts, a private research university in Massachusetts ([Impastato, 2021](#); [Topper, 2021](#)), both in the United States; with a staff member and a graduate student in one stream of a larger partnership program at McMaster, a large, research institution in Canada ([Foran et al., 2020](#)); and with a staff member and an undergraduate student at Victoria University of Wellington, a research-intensive university in Aotearoa/New Zealand. About her experience of co-facilitating with a staff member, an undergraduate student wrote that one of the most important lessons she learned was “that pedagogical partnership work is not about knowing but *seeking*.” She continued: “I realized that genuinely engaging and exchanging points of view with others through open-ended questions encourages growth and learning and builds cherished relationships in academia” ([Bala, 2021](#) p. 5). [Leota and Sutherland \(2020\)](#) describe facilitation of their partnership program in Aotearoa/New Zealand in reciprocal terms as well: “we ask everyone participating to think of themselves in partnership; it is not just students as partners, but also academics as partners and academic developers as partners” (p. 95).

Co-facilitation by a faculty/staff member and post-baccalaureate fellow

Post-baccalaureate (post-bac) fellows who support pedagogical partnership work at several institutions are recent graduates of colleges at which they participated as undergraduate student partners. Such fellows bring lived experience and knowledge of pedagogical partnership work that is invaluable in supporting current student partners as well as that complements and informs faculty/staff directors’ knowledge and expertise. Trinity University in the southern region of the United States was the first to pilot this approach, and the post-bac fellow role has remained part of their permanent facilitation structure ([Cook-Sather et al., 2019a,b,c](#)). At Berea College, also in the southern United States, student partners enroll in a course for academic credit, and for the first 2 years of the program, as part of its launch, this course was co-facilitated by the director of the partnership program and a post-bac fellow ([Ortquist-Ahrens, 2021](#)). This approach provides person-power when directors might find it difficult to devote time and energy to developing partnership programs on their own, given their other responsibilities; offers experience with or knowledge of partnership work to those who lack them, as do most beginning directors; and lends credibility to those who have a commitment to modeling and enacting partnership in developing partnership ([Ortquist-Ahrens, 2021](#)). A post-bac position was also conceptualized as part of planning for a partnership program in Grenada, West Indies.

Facilitation by a single student

A newly emergent approach positions an undergraduate with experience in pedagogical partnership work as the facilitator of student-faculty partnership at other undergraduate institutions. A student who had been the co-creator of the pedagogical partnership program at Vassar College in New York took on a similar role for Emmanuel College in Massachusetts, both private colleges ([Bala, 2021](#)). The reciprocity in such a situation goes in multiple directions—between this student facilitator and student partners, between the student facilitator and faculty partners, and between the student facilitator and her collaborator at Bryn Mawr and Haverford Colleges, who also supported the launch of both Vassar’s and Emmanuel’s partnership program. This multi-layered, cross-role, inter-institutional partnership work to support reciprocal teaching and learning positioned all participants as teachers and learners.

Challenges and ways of addressing them

There are complex and overlapping challenges to engaging in and fostering reciprocal teaching and learning through pedagogical partnership. In keeping with the spirit of partnership, challenges can be conceptualized as opportunities for critical reflection, bringing to bear multiple perspectives on any given issue or problem, and embracing a diversity of possible approaches to addressing the challenges.

One key challenge to engaging in and fostering reciprocal teaching and learning through pedagogical partnership is resistance to co-creation ([Bovill et al., 2016](#); [Cook-Sather and Matthews, 2021](#); [Matthews, 2019](#); [Ntem and Cook-Sather, 2018](#)). Some of the sources of resistance have been conceptualized as threshold concepts in pedagogical partnership—such as that students have

valuable knowledge of and important perspectives on teaching and learning (see Cook-Sather et al., 2019a,b,c, for a full list of threshold concepts in pedagogical partnership). If these are not addressed, they can not only impede the realization of partnerships' potential but also cause harm. While resistance may be understandable, given the counter-cultural nature of partnership work, faculty and staff committed to reciprocal teaching and learning through pedagogical partnership have described striving to clearly communicate intentions to open up dialog and give people time to grapple with the paradigm shift partnership requires and embodies (Cook-Sather and Matthews, 2021). When student partners have encountered resistance, they have described "striving to build trust and relationships; taking further steps toward their faculty partners (or a kind of leaning in) in an effort to realize the transformative potential of partnership; and, conversely, withdrawing (or taking a step back) out of self-protection" (Ntem and Cook-Sather, 2018, p. 83).

A second challenge to engaging in and fostering reciprocal teaching and learning through pedagogical partnership is navigating institutional structures, practices, and norms. These might include curriculum constraints and accreditation or institutional reporting requirements as well as overall culture. While an institutional assessment framework or a set of metrics might not be changed, easily or at all, it is possible to focus on what can be co-created; faculty and students can work together to decide how to meet institutional requirements (Cook-Sather and Matthews, 2021). In terms of overall institutional culture, when faculty and students embrace empathy for and productive vulnerability to another, they take action to make change that can contribute to culture shifts (Cook-Sather and Mejia, 2018; Gibson and Cook-Sather, 2020; Hernandez, 2015). Positioning equity-denied students in partnership with faculty supports those students in mobilizing their identities to foster change for equity, inclusion, and culturally sustaining practices (Bell et al., 2020; Cook-Sather and Agu, 2013; Cook-Sather et al., 2019a,b,c). Finally, time is often identified as a challenge, although investing time up front in developing partnership practices can save time later, since learning experiences/insights/outcomes will likely be more meaningful and impactful (Cook-Sather et al., 2014; Cook-Sather and Matthews, 2021).

A third challenge is inclusivity. The whole-of-class approach to student-faculty pedagogical partnership includes all students (Bergmark and Westman, 2016; Bovill, 2020), although that may not mean that it is in fact realizing inclusivity. For student-faculty pedagogical partnership work with liminally positioned student partners, considerations such as which students to invite into partnership and why, who has access to partnership and who does not feel they do, and how partnership challenges or reinforces existing inequities are all questions of inclusivity (Ameyaa et al., 2021; Bindra et al., 2018; Bovill et al., 2016; Cook-Sather, 2020; de Bie et al., 2021; Cook-Sather and Matthews, 2021; Marquis et al., 2018; Mercer-Mapstone and Bovill, 2019; Mercer-Mapstone et al., 2019). Guidelines developed for launching and supporting partnership work with liminally positioned student partners address inclusivity—as well as equity and justice—in the following way (the text in regular font is from Cook-Sather et al., 2019a,b,c) reframed in equity terms (the text in italics is from de Bie et al., 2021, p. 106):

- Consider why you want to develop a pedagogical partnership program and what might get in the way, *paying particular attention to who has been well- and under-served by your institution, who stands to benefit from a partnership program or project (e.g., the institution, those least served), and what potential harm a partnership initiative might inadvertently cause.*
- Decide what kind of partnership program is right for your context and how, *in particular, such a program or project might redress harms and support the pursuit of greater equity.*
- Think through how to situate and structure the program, get started, and plan for sustainability *such that the needs and interests of those who have been least well served by the institution continue to be addressed in the program or project.*
- Decide on the shared responsibilities of facilitating pedagogical partnerships, *paying particular attention to the forms of and whose emotional as well as epistemic labor might be involved and how to resist emotional and epistemic exploitation.*
- Create an approach to inviting and supporting participants, *particularly attending to creating structures and approaches that welcome students from equity-seeking groups and recognize differences in experiences rather than assuming a homogeneous student perspective or experience.*
- Prepare for managing logistical and emotional challenges of partnership *and how differently positioned people will face different challenges, understanding that the challenges may not be fairly distributed and that participants will be differently impacted or affected by them.*
- Develop ways to assess pedagogical partnership work *that focus in particular on the potential for partnership to exacerbate or redress epistemic, affective, and ontological harms.*

A fourth challenge, which is implicit in the challenges noted above, is how to navigate power dynamics. Power dynamics are embedded in daily pedagogical partnership processes and relationships, even as those endeavor to "disrupt traditional student-faculty power relations" (Kehler et al., 2017, p. 4). In whole-of-class student-faculty partnerships, faculty members' "dismantling of the classroom power structure" (Cates et al., 2018, p. 41) can lead to students feeling empowered, but faculty sharing power can also create both internal conflict (within individual students) and interpersonal conflict (among students and between students and the teacher), which can be both challenging and generative (Godbold et al., 2021). In partnership work, many faculty can feel "wary of giving too much power to students" (Murphy et al., 2017, p. 7), while others can embrace an approach to "working together to take full advantage" of the expertise of students alongside that of faculty and staff, which can lead to understanding "the true meaning and importance of shared power through collaboration" (Mihans et al., 2008, p. 5). The latter reflects an understanding of "sharing power with [student partners], not exerting it over them" (Delpish et al., 2010, p. 98).

Future directions

Reciprocal teaching and learning through student-faculty partnership has informed not only approaches to and analyses of educational practice but also conceptions of educational development and scholarship of teaching and learning. Future directions in this work might explore how reciprocal teaching and learning can more fully permeate these and other areas, particularly as an integral component of expanding commitments to equity.

Approaches to and analyses of educational practice

Classrooms are “locations of possibility” (Cates et al., 2018; hooks, 1994), and both locations of and possibilities for partnership in teaching and learning have expanded as a result of the Covid-19 pandemic (Ntem et al., 2020). These spaces of learning and teaching might be further reconceptualized through sharing responsibility for the co-creation of learning environments, curriculum, assessment, and more. A focus on equity in classroom practice is increasingly recognized as essential, and student-faculty partnership can raise awareness of a range of equity issues and take those as the focus of partnership work (Cook-Sather, 2020; Marquis et al., 2021). Exploring the role of culture in partnership work by linking macro level to everyday/micro work of the partnership can make the role of culture more visible and present and challenge assumptions that Western culture is primary and all others are “other” (Zhang et al., forthcoming). This questioning of the centrality of “Western” culture in partnership work/scholarship is a vital issue for ongoing consideration.

Conceptions of educational development

Several scholars have argued for a reconceptualization of educational development that both enacts and supports reciprocal teaching and learning through student-faculty partnership (Cook-Sather et al., 2019a,b,c; Felten et al., 2019; Marquis et al., 2019). Positioning undergraduate students as educational developers challenges power dynamics within educational development and supports reciprocal learning about teaching through partnership (including co-created educational research), which in turn can support reciprocal teaching and learning in classrooms. Supporting the development of such work is challenging in the Global North (Cook-Sather et al., 2019a,b,c) and even more so in the Global South (Cook-Sather et al., forthcoming). Future research might further explore what enhances outcomes and what reduces inhibitors to the engagement of students and faculty in learning and teaching partnerships (Matthews et al., 2019) across countries, cultures, and contexts.

Scholarship of teaching and learning

Reciprocal teaching and learning through student-faculty partnership in scholarship of teaching and learning (SoTL) might shift toward valuing not only dominant, Western ways of knowing but also long-standing, indigenous ways (Yahlinaaw, 2019) and recognizing all students as authors, reviewers, advisors, and editors (Cook-Sather et al., 2021a). SoTL projects that embrace student-faculty partnership enact one of Felten’s (2013) five principles of good practice in SoTL—“that inquiry into learning be conducted in partnership with students” (p. 123)—and valuing a diversity of perspectives and forms of writing will be critical to the future of SoTL if it wants to strive for inclusion and equity. Partnership in SoTL can generate enhanced research that in turn informs and constitutes a form of educational development with the potential to enhance teaching and learning.

These forms of reciprocal teaching and learning through student-faculty partnership—approaches to and analyses of educational practice, conceptions of educational development, and scholarship of teaching and learning—constitute current, enacted, educational practices, support of and growth in conceptions of and approaches to educational practice, and theories and analyses of both. Each informs the other, and, through this dynamic, institutions of higher education might move to create cultures of partnership through which reciprocal teaching and learning become expected and supported rather than the exception perpetually in search of greater support. Such a culture would support the realization of higher education’s espoused aspirations toward equity and inclusion. Essential to creating such a culture is the embrace of a “partnership mindset” (Paseta et al., 2020). In the same way that partnerships create “as-if” spaces (Cook-Sather and Felten, 2017) in which to develop practices that can then be carried beyond the partnerships, partnership mindsets can shape how partners work, act, and live outside of higher education—precisely the orientation that individuals and communities need to work on the complex issues facing our neighborhoods, cities, countries, and world.

Acknowledgments

Many thanks to Peter Felten, Beth Marquis, Kelly E. Matthews, and Elliott Shore for their feedback and suggestions on drafts of this entry.

Introduction

The emerging Fourth Industrial Revolution (4IR) has gained widespread recognition, as has the imperative to ensure informed and proactive responses at state, sectoral and institutional levels. This paper aspires to assist our understanding of this phenomenon in South Africa, mindful of the many dimensions of the 4IR and its promise for national development and the higher education sector. It further considers interventions to leverage the potential of the 4IR in higher education while seeking to understand wider policy, planning, and development implications. Finally, challenges and obstacles are identified, many of which relate directly to South Africa's socioeconomic conditions.

According to the World Bank, South Africa is one of eight upper-middle-income economies in South Africa. Despite this, and since 1994, the socio-economic status of much of South Africa's population has not changed. The Gini coefficient of per capita household income is usually well above 0.6.6 according to [Statistics South Africa \(2019\)](#). On a global basis therefore, this puts South Africa among the "top 5" most unequal countries. Despite disagreement over the actual levels of inequality, the experts agree that inequality in South Africa is still extremely high and has remained unchanged since 1993 ([Statistics South Africa, 2019](#)). Consumption disparities or inequalities persist over time due to high wealth inequality, which inhibits intergenerational economic mobility ([World Bank, 2022](#)). In the labor market, having a post-secondary or university degree is essential for both finding work and earning higher income. The significant inequality in land ownership continues to contribute to the perpetuation of historically high levels of income inequality in Namibia and South Africa ([World Bank, 2022](#)). These two countries have far greater levels of inequality than Botswana, Eswatini, Lesotho who also have wealth inequalities ([World Bank, 2022](#)). In South Africa, the richest 10% possess 86% of all the wealth, with the top 0.1% owning nearly a third ([Chatterjee et al., 2022](#)). More than 15% of household net worth is concentrated in the top 0.01% of the distribution (3500 individuals), compared to the bottom 90% as a whole ([Chatterjee et al., 2022](#)). Since the end of apartheid, there has been little sign of decreasing poverty ([Chatterjee et al., 2022](#)). Despite progress toward equality and redress in post-apartheid South Africa, the reality is that an estimated 48% of the population lives on less than \$2 per day, according to the [National Planning Commission \(2011\)](#).

As in other countries, wealth inequality in South Africa affects both basic and higher education. The historical and current racial, economic, and intellectual conditions result in a two-tier system, with historically advantaged institutions desegregating by attracting middle-class black students ([Motala et al., 2021](#)). Historically disadvantaged institutions' students are largely black working-class ([Motala et al., 2021](#)). [Mamdani \(2016\)](#) argues that the gap between higher education institutions (HEIs) in South Africa reflects the continuous divide between quality and relevance, as previously advantaged institutions rely on excellence to maintain their advantage, networks, and academic autonomy. It seems there is no other country with the unique distinctions between historically advantaged and disadvantaged institutions ([Mamdani, 2016](#)).

With these ongoing disparities in South Africa and across higher education, the 4IR could exacerbate inequality. It is unclear if historically disadvantaged institutions have the infrastructure to embrace the 4IR. It is not all doom and gloom. The 4IR provides a glimmer of hope in an education system with high disparities. There is a possibility that it could increase the rates of access and success in higher education. Conditions need to be put in place so that the introduction of 4IR in all HEIs be done in such a way that it does not widen existing gaps.

What is the Fourth Industrial Revolution?

[Schwab \(2015\)](#) is the leading and arguably most influential proponent of the idea of the 4IR, or Industry 4.0 ([Marwala, 2020a](#), p. 25). However, there are disagreements. Industry 4.0 has been seen as part of the 4IR with its roots in German manufacturing in the

early 2000s (Gleason, 2018, p. 2), suggesting that developments associated with the 4IR have occurred over time rather than in a revolutionary moment. They should appositely be labeled *evolutionary*, not *revolutionary*.

Schwab foresees that the 4IR “will fundamentally alter the way we live, work and relate to one another. In its scale, scope and complexity, the transformation will be unlike anything humankind has experienced before” (Schwab, 2015, p. 1). Gastrow elaborates that humanity is “undergoing multiple changes: increased longevity, augmentation of human bodies and minds, the changing nature of work, the changing nature of learning, changes to human connection and connectivity, and changes to identities, among others” (Gastrow, 2018, p. 10). Schwab’s signaling of the far-reaching and unprecedented nature of anticipated changes constitutes the main argument for the 4IR as a *revolution*. Innovation stemming from 4IR technologies, impels leaders to understand and respond to the changing environment. Schwab imagines citizen engagement with governments using emerging technologies, predicting that governments will harness technology to exercise greater control and surveillance (Schwab, 2015, pp. 1–6).

Risking (2016) argues that the 4IR is merely continued digitalization, not fundamentally different from the 3IR (in Jivan, 2020, p. 7). Marwala (2020a,b) distinguishes between the 4IR and the 3IR, or digital revolution, maintaining that the 4IR is focused with the making of intelligent digital infrastructure that seamlessly use data to improve, integrate and advance economies and societies.

Schwab’s response is that while features of the digital revolution have provided the foundations on which advances in the 4IR have been built, the 4IR’s scope, speed and system-wide impact is qualitatively different (Jivan, 2020, p. 7). Beyond changing the nature of work and productive systems, it signals critical changes to how knowledge is used, developed, disseminated and shared. Universities play a vital role in these processes. From an industry perspective, Deloitte adds that the need is apparent “to nurture a culture of lifelong learning, equipping their workforces with the skills necessary to succeed in the future” (Deloitte, 2020, p. 2). Automation will impact on jobs. It is projected that 50% of jobs in agriculture, forestry, fishing, and hunting, representing 328 million workers, are automatable. Figures for manufacturing are 237.4 million; for retail 187 million; for China 395 million; for India 235 million; for the USA 60.6 million (Gleason, 2018, p. 4, quoting a McKinsey Global Institute Report of 2017). While automation will benefit production, catering for an ever-growing world population, the socio-political impact of the loss of livelihoods demands attention, raising the question of the interplay between technological and social change (Gastrow, 2018, p. 23). Deloitte further proposes that organizations begin to gather data that will help them develop a deeper insight into the future so that their strategies related to Industry 4.0 are based on firmer foundations (Deloitte, 2020, pp. 5–7).

In South Africa, responses include initiatives driven by the Presidency and a Ministerial Task Team (MTT) on the 4IR established by the Minister of Higher Education and Training. The South African Presidential Commission on the Fourth Industrial Revolution (PC4IR) reported in October 2020 with a vision of 4IR as potentially enabling attainment of the National Development Plan (NDP) goals (PC4IR, p. 137). Policy interventions such as the PC4IR (2020), and MTT (DHET, 2020b), acknowledge South Africa’s need for a coordinated and development-orientated approach, with the 4IR in a potentially catalytic role. Gastrow, like others, (Gleason, 2018; Marwala, 2020a), has argued for the momentous and imminent significance of the 4IR, noting its potential developmental benefits. He contends that being prepared means positioning institutions so that “the 4IR is harnessed for the benefit of human wellbeing, and in support of national and international social and economic benefits” (Gastrow, 2018, p. 10), a view in accordance with the NDP (National Planning Commission, 2011), and PC4IR (2020).

Socioeconomic realities confronting SA higher education

This positioning of the 4IR occurs in concert with the socio-economic challenges that are currently urgent priorities in national development in South Africa. Having inherited structural inequalities from the apartheid regime, the country continues to be among one of the most unequal in the world. In the labor market, having a post-secondary or university degree is essential for both finding work and earning higher income.

A snapshot of the degree of inequality in the country can be described by the following statistics. At the top end, all types of assets, including homes, pension funds, and financial assets, can account for such levels of inequality. Since the end of apartheid, there has been little sign of decreasing poverty with 86% of wealth in the country belonging to 10% of the population (Chatterjee et al., 2022). These inequalities have affected every sphere of society in South Africa, including basic and higher education, which are regularly held as examples of the lasting impact of apartheid social engineering on the shaping of progress and opportunity.

The racial, economic, and intellectual conditions in South Africa’s higher education have resulted in a two-tier system affecting every aspect of how institutions operate. Historically white institutions continue to be research-intensive, attract significant funding, and attract high-quality staff which in turn allows for greater selectivity of students (Motala et al., 2021). Historically black and disadvantaged institutions, on the other hand, continue to cater to working-class black students, are heavily reliant on (reducing) government funding and financial aid, and lack the enabling conditions to support research due to heavy teaching loads and academic support requirements (Mouton et al., 2015, 2021), which has consequences for throughput, graduation, and post-university prospects. These were just some of the cleavages contributing to the eruption of the #RhodesMustFall and #FeesMustFall student movement in 2015.

While the 4IR could exacerbate inequalities, it offers the prospect of increasing rates of access and success in the system through targeted interventions using the enhanced technologies on offer. South Africa is not a unique case to higher education systems around the world, especially in post-colonial settings, which have had to address access and equity to unlock opportunities for marginalized groups. However, given the high degrees of inequality in the country, intimately coupled with a history of racial

segregation, the country represents a unique case for understanding both the urgency of social justice and the complex challenges that emerge in the course of addressing it—which may perhaps be further complicated by the prospects and possibilities of the 4IR.

Supportive infrastructure, access to devices and cost-effective connectivity in higher education

National infrastructure to support the 4IR in South Africa is critical to success. Marwala poses the dilemma: “How can we possibly focus on the 4IR when we are still struggling with the second industrial revolution?” (2020a, p. 58). South Africa is in the early stages of 4IR preparedness, including in the higher education sector (Marwala, 2020a, p. 25). Encouragingly, a high percentage of African institutions indicate that student enrollment is undertaken online: 53% fully online, 37% partly so (Jensen, 2019, p. 26). This is unexpectedly high given the resourcing and bandwidth challenges in many African countries.

Reinitz (2020) cautions against assuming that putting courses online or using a technological solution is digital transformation. Developing Risking’s position, Reinitz distinguishes between *digitization*, constituting transition from analog to digital form, entailing organization of vast amount of online information; *digitalization*, using digital technologies to transform institutional operations, and *digital transformation* (Reinitz, 2020, p. 2). *Digital transformation* comprises “an institutional strategy to transform the strategic direction or value proposition of the college or university,” leading to institutional transformation (Reinitz, 2020, p. 2). This is perhaps the most promising approach to leveraging the affordances of the 4IR. From this vantage point, true transformation is thoroughgoing and coordinated, scrutinizing the strategy, value proposition, and business model of the organization (Reinitz, 2020, p. 1).

There are stark inequalities in the African context. In Africa, 24.4 individuals per 100 used the internet in 2018, compared to 45.3 in the developing world and 80.9 in the developed world. Only 7% in Africa considered internet infrastructure very satisfactory, with 39% indicating that it was good in big cities but poor in rural areas (Jensen, 2019, pp. 16–17). These figures suggest a huge obstacle to harnessing technology and taking advantage of the 4IR. In South Africa, the DHET survey revealed that most students own smartphones and at least 60% own a laptop. Devices have been acquired in a variety of ways, with at least 44% paid for through NSFAS or other bursary funds (DHET, 2020a). Only 50% of students reported good connectivity where they are studying. Most bought data bundles from service providers (62%), while 46% utilized free access through the university. Other alternatives included public Wi-Fi (8%); home facilities (16%); monthly SIM contracts (9%); and hot spotting off someone else (23%) (DHET, 2020a, pp. 28–31). The dependence of a large proportion of students on their universities to provide Wi-Fi access is significant. Cost of data in South Africa, among the highest in the world, remains prohibitive for most students. This constitutes a barrier to students using online modalities for learning, communication, and support.

The IAU study reveals that 24% of institutions in Africa report using learning management systems fully compared to a global average of 35%. A further 46% indicate that they are using them somewhat, 19% report it as being discussed and 11% indicate it is not on the radar (Jensen, 2019, p. 27). The management of the COVID-19 pandemic in higher education in South Africa demonstrated that institutions held varying capacity to respond to the multipronged needs of students and staff in the context of increased crisis (Menon and Motala, 2021).

The 4IR Task Team identified challenges to tertiary and vocational education that required addressing in the process of optimizing the sector. Greater flexibility is needed in admissions, curriculum design, teaching, learning and assessment, with more responsive quality assurance and support to undergird these processes (DHET, 2020b, p. 40). The necessity of flexibility and for institutions to respond dexterously, unfettered by bureaucratic oversight and regulation, cannot be overemphasized. Considering all this, the PC4IR Report states that the 4IR provides “an opportunity to redesign, streamline and align the education system through a coordinated, robust, multi-stakeholder process. The purpose of the next version of our skills ecosystem will be to leapfrog our youth into productive work and reskill current workers for job retention and ongoing productive work in the economy” (PC4IR, 2020, p. 173).

The potential for higher education, teaching and learning

Universities are changing. Williamson and Hogan contend that the ideal is shifting to the “‘data-intensive’ and ‘digital-first universities’ ... that creates valuable new digital knowledge and develops digital data skills to support emerging capitalist data economies.” (Williamson and Hogan, 2021, p. 13, referencing Berry, 2020). Badat (2020) has contested Marwala’s (2020b) upbeat vision of a 4IR future on a similar basis, and cautioned against pursuing a “technocratic utopia,” drawing attention to the restricted and uneven benefits of previous industrial revolutions. Marwala argues that a novel feature is that it “is based not on a single technology, but on the confluence of multiple developments and technologies,” changing life, work, and communication and “reshaping government, education, healthcare, and commerce.”

Badat (2020) acknowledged that “New developments in knowledge, science, technology and ways of economic production are the probable trajectory of the future” but warned of the insidious effects “manifest in rampant inequality and the massive accumulation of wealth and power in the hands of a tiny minority.” Central to his critique is that the 4IR is viewed as entirely scientific and technological, “not as a social or human matter,” especially in a society as deeply fragmented as South Africa. Indeed, increased unemployment and other regressive outcomes are entirely possible, instead of the anticipated developmental surge. Paradoxically,

the 4IR poses huge threats to a society struggling to shake off its grievous inheritance of poverty, inequality, unemployment, and lack of opportunities.

Gillwald, observing the relentless advance of 4IR technologies, warns about consequences. Their rise, she says, will disrupt economies and societies unevenly: "Like other industrial revolutions, this one will be characterized by evolution as much as by disruption. Unless something dramatically different is done, one of the continuities will be the perpetuation of inequality. And the primary determinant of inclusion is education and digital skilling" (Gillwald, 2019, p. 1). Indeed, a social justice perspective obliges consideration of how the already disadvantaged and marginalized may benefit from the 4IR, failing which inequality is likely to increase.

While a good start at state level would be progressive policies, solutions focusing on skills development may not be entirely relevant. Vally and Motala (2014, p. 4) argue that the skills discourse "has 'persuaded' policy makers to ignore the combination of social, economic, political and cultural factors which make the acquisition of knowledge and skills difficult for working-class and poor communities." Like Fataar, they contend that it "downplays the impact of poor access to educational institutions and costs, locally-based educational facilities and infrastructure, pedagogical barriers arising from being taught in unfamiliar languages together with the relative powerlessness to intervene in ways that can counteract the weight of existing relations of power" (Vally and Motala, 2014, p. 4; Fataar, 2020, p. 4). Clearly expectations surrounding the 4IR must be tempered by consideration of underlying inequality, and how the underprivileged may be impacted as the 4IR advances.

Presciently, Jensen warns of the cost of neglecting social justice, and the responsibility that therefore devolves on HEIs. He argues that "knowledge divides," excluding the underprivileged from active roles in society, are more significant than "digital divides." "Higher education institutions are at the heart of knowledge creation and dissemination; it is therefore only natural that higher education takes an active part in shaping a knowledge society" (Jensen, 2019, p. 53). As institutions with immense capacity to inform, support and advocate social justice, HEIs will be failing in these duties should they not attend to access to and availability of technology to the poor and marginalized, as well as shape teaching and innovation toward the pursuit of more inclusive societies. This foregrounds both their intellectual and developmental role in society (Mamdani, 2016).

Technology in higher education has become an increasingly strategic priority for governments and universities. The International Association of Universities (IAU), with approximately 650 members, anticipated that technology would have implications for the future development of higher education and society. During 2018 it embarked on developing a policy statement on the subject with consultations held with higher education leaders from nearly 700 institutions from 106 countries (Jensen, 2019, pp. 8–9). Jensen describes how HEIs need to respond to a technologically transforming world which impacts on "the everyday lives of citizens, on how societies are developing, on the skills and competences required to take part in society; and most importantly, on how to access information and knowledge." Although transformations are multifaceted, "one factor common to HEIs is that they are all confronted with the question of how to adapt and shape higher education in an increasingly digital world" (Jensen, 2019, p. 51). Given the obstacles related to infrastructure, data, and access to devices which have emerged in analyses such as those of the NDP and PC4IR, the IAU's findings that technology is being substantially integrated into teaching are encouraging. For African universities in the study, 38% of respondents indicated this is happening very much, while 49% indicated that it is happening to some extent (Jensen, 2019, p. 29). There is some way to go, but progress is noteworthy.

To illustrate, in South Africa, reforms aimed at harnessing the 4IR to national development goals are signaled in the PC4IR Report (PC4IR, 2020, p. 161). Driving the national 4IR initiative will be a Digital and Future Skills Forum which will probably provide guidelines for curriculum reform and projections of the skills and competencies required for future employment, cultural and intellectual enrichment and learning beyond the formal curriculum. Curricula will have to be geared to developing critical digital skills. Fundamental questions about the relevance, adequacy, and responsiveness of current curricula will doubtless loom large.

More sophisticated use of digital technology in tertiary education is required, starting with the currently unevenly spread 3IR technologies which continue to be a restraint to the 4IR. Online data and information management; data aggregation; and analyses of data for student success and support is needed to increase success and throughput. Possibilities emerge for more frequent assessment and for online learning management. In line with these possibilities, du Preez and Sinha argue for post school education to at least "adapt to the changing nature of work, and ideally, lead this evolution" (2021, p. 13). South African HEIs are addressing these imperatives, hastened by the COVID-19 pandemic that has shifted most teaching and learning online.

Most HEIs have responded to technological change within their capacities. Czerniewicz et al. (2021, p. 12) state that large-scale changes are refashioning higher education: "these changes are producing emergent forms of teaching and learning and question academic roles with regard [to] who has ownership and control over the teaching and learning process." They also argue that marketization (entrepreneurial competition), digitization (educational provision mediated by digital technology) and unbundling (disaggregation of educational provision through technology-based partnerships with private providers) are impelling new forms of teaching and learning (2021, pp. 1–2). They say that "there are polarized views (in the contexts of South Africa and the UK) about the value of digitally mediated forms of provision" (2021, p. 10). These findings signal the need to sift realistic and advantageous approaches from the sometimes near-evangelical promotion of resource-intensive and ever more complex technological solutions.

In higher education, more sophisticated use of digital technology for administration, teaching, learning support, and e-learning could have a discernible impact on quality, efficiency, and success. Online data and information management; aggregation of data; and analyses of data for student success and support have impacted success and throughput rates positively. In the final analysis, the use of ICTs must lead to improved student engagement and learning, as Mishra and Panda (2020, p. 4) and as Marwala advocates,

emphasizing “real-world problem-solving abilities and a multi-disciplinary approach to curricula that are more interactive” (Marwala, 2020a, p. 158).

The spread, reach and impact of technologies and services aimed at higher education are clearly underway. Indeed, they are ubiquitous: “The global industry of educational technologies and data services has grown to encompass every aspect or ‘market segment’ of HE activity” (Williamson and Hogan, 2021, p. 15). The benefits in efficiency, reach in recruitment, simpler business processes and enhanced learning support, among others, are clear, even as more pernicious effects emerge. These include increased unemployment, a widening digital and knowledge divide, and greater intrusion on privacy as data on individuals is collected and mined by state and commerce.

Enabling conditions

It has been noted in this discussion that the 4IR may have negative employment consequences. Marwala characterizes the future as “post-work ... because the need for humans in the workforce will be severely curtailed, effectively changing the face of labor.” Nonetheless, opting out of the 4IR is not advisable: “Either we participate, or as a country we are economically obliterated, relegated to the ‘dustbin of history’” (Marwala, 2020a, p. 130).

The 4IR has immense promise, but various enabling conditions are needed at national and institutional levels before tangible benefits can be realized. First is the imperative to harness the benefits of the 3IR, many of which are preconditions for the 4IR. The COVID-19 pandemic has had a discernible effect on access and attainment due to technological barriers, which emphasizes the urgency of the need for digital integration (Atherton, 2020, pp. 1–2).

Measuring success in the use of and student receptiveness to learning technology is important even before considering devices and connectivity. COVID-19 has exposed many students to the advantages of online instruction and the DHET survey indicates some satisfaction with it. A significant proportion of respondents indicated that learning materials provided clear learning outcomes (65%); gave access to relevant content (69%); explained new content and concepts carefully (60%); was well organized and sequenced (61%); and provided activities enabling critical engagement (61%) (DHET, 2020a,b, p. 34). Capacity notwithstanding, these findings signal the readiness of most public HEIs to shift decisively to online learning and support, and growing receptiveness among students.

The impact of online learning is yet to be established, but the DHET survey has shown that many students are utilizing it for various purposes. Ninety-two percent indicated they submit assignments online; 78% for downloading materials; 76% for writing tests; 73% for email communications; 71% for accessing learning materials; and 70% for discussions with classmates. A further 43% attended virtual lectures (DHET, 2020a, p. 29). Academics and learning support practitioners carry a similar responsibility to become proficient in digital tools and working with students in adapting to new learning modalities. Menon and Castrillon observe that “If HE is to prepare students for the challenges of the 4IR, a more rigorous engagement is required by all academics across the board—cutting through silos—innovative pedagogies that enable students to become independent learners outside the confines of the lecture halls” (2019, p. 11). This requires major shifts to the process of curriculum development and the way that teaching and learning grapple with the 4IR as a reality within a promising yet challenging and highly unequal social context.

Implications for curriculum

A central purpose of higher education is cultivating “capacity for academic achievement and retention of knowledge among graduates to prepare them for a productive life” (Gleason, 2018, p. 5). Caution is needed to ensure that economic imperatives do not overshadow the social and the environmental. How curricula change in response presents its own challenges. Responsiveness to alterations in knowledge and work, to equipping students with digital skills, and to often narrow industrial needs may lead to greater instrumentalization of higher education, especially when coupled with new approaches to credentialing, such as stackable qualifications and micro-credentialing. As proposals become policy, universities must guard against unintended consequences detracting from their role and purpose. Potential threats are greater vocationalization of curricula, and the development of tiered higher education, with higher order knowledge for elites and vocationally orientated knowledge for the masses.

Fataar identifies the fundamental faultline in the conventional curriculum, with its emphasis on “generic skills and student learning, and its de-emphasis of disciplinary learning, concepts, and content knowledge.” It therefore “falls into the trap of what Maton (2014) has called knowledge blindness” (Fataar, 2020, p. 16) rooted in a failure to provide students with concepts which form the foundations for ongoing acquisition of the more comprehensive knowledge being offered in its stead. In response, multi-disciplinarity is gaining momentum as a resolution to complex challenges precipitated by the 4IR (Marwala, 2020a, pp. 156–157).

The PC4IR Report also considers the curriculum, signaling what might require attention to promote sectoral alignment with South Africa’s national developmental goals. In the short-term urgent action is required to redesign, streamline and align the education system. It also envisions “stackable competencies which are micro-credentialed, industry-aligned and allow people to enter and exit the system at multiple points as part of a lifelong learning process” (PC4IR, 2020, p. 173). The MTT on the 4IR concluded similarly (DHET, 2020b, p. 10). The MTT also examined the changing work landscape, with new technology-related capabilities, skills, and roles in the workplace (DHET, 2020b, p. 24). The MTT proposed a new PSET vision, with core education and training programs aligned with the changing needs of South African society, ensuring high-quality education meeting the urgent demand for digital

skills, providing short courses for the unemployed and underemployed and preparing people to cope with accelerating social and economic change.

Vittore and Govern argue that “[I]nstitutions, students and employers are placing increasing attention on transversal, in addition to subject-specific competences, particularly as the employment market becomes more fluid. As the labor market changes, so do expectations regarding the type of transversal skills needed by graduates” (Vittore and Govern, 2020, p. 4). The capacity and appetite of the PSET sector to realize the 4IR’s potential is inadequate according to the MTT: “Current curricula, programs, and courses are misaligned with labor market demands, while mechanisms to review and update programs and curricula are highly bureaucratic and operate in long, slow cycles” (DHET, 2020b, p. 35). This signals the need for sustained effort to reach an appropriate state of responsiveness and capability, beginning with a review of the perceived misalignment, and devising approaches to narrow the gap.

Imperatives for change flowing from the 4IR

As discussed, in Gastrow’s words, we will probably experience “technological change as a broad and accelerating process” (2018, p. 17). Consequences follow for strategic, policy and systemic change. Du Preez and Sinha remind us how inadequate higher education systems were during previous industrial revolutions, when the need to develop new disciplines was incontrovertible. They indicate that we are in a similar situation and caution us to respond rapidly to 4IR disruptions and to recognize the need for change at all levels (2021, p. 14).

Digital technologies will be prominent in this area. This preoccupies policy makers and thinkers in the developed and developing world. In Europe, Jørgensen contends that dependence on American or Chinese technology is seen as a threat to sovereignty. If it “has too few citizens with digital skills, particularly those that develop new technologies, it would be completely dependent on imported technologies” (Jørgensen, 2019, p. 4). The same concerns apply in developing countries such as South Africa.

Adaptation in the context of wider transformation is echoed in the MTT report. The intersection of technological revolution, societal transformation and radically new business and governance methods makes 4IR disruptive and transformative. South Africa therefore needs to identify, and excel in, targeted technical and scientific disciplines that best align with the country’s development agenda (DHET, 2020b, p. 21). While the emphasis on STEM disciplines is understandable, this should not happen at the expense of the social sciences and humanities.

Investment in 4IR related infrastructure, IT solutions, capacity development and revised business processes must accompany student access to devices and economical internet access. Student skills development must enhance internet use for learning purposes, enriching lives culturally and intellectually and broadening learning beyond the formal curriculum. Gastrow advocates strengthening interaction between educational institutions and employers. This requires:

- Cultivating the capacity of post-school education institutions to engage with employers and understand their changing skills requirements.
- Shortening the curriculum change cycle to respond to changing technologies.
- Cultivating a research agenda that responds nimbly to technological change (Gastrow, 2018, p. 26).

The orthodoxies currently shaping higher education, including program and qualification structures and regulations, quality assurance, how learning credits are accumulated and how learning occurs, need fundamental rethinking. Barber argues that technology and the resulting competition will threaten many aspects of traditional universities, implicitly warning them to become efficient, economical, and appealing (Barber et al., 2014, p. 32). Gleason agrees, noting that “from micro-credentials, Education 3.0, nano-degrees, adaptive learning, micro learning, upskilling, to the idea of preparing for just-in-time education, the message is that we must all keep learning” (Gleason, 2018, p. 6).

As argued earlier, many obstacles need overcoming if 4IR potential is to be realized and the required curriculum reform implemented. The MTT report identifies a critical barrier, “the rigid, slow and arduous processes of quality assurance and program accreditation at institutional and national levels. The policy environment is at best unreceptive, and at worst hostile, to a more agile credentialing system” (DHET, 2020b, p. 34). Relevant agencies such as SAQA and the CHE must be responsive and adaptive. Menon and Castrillon are cutting:

This compliance-heavy system, coupled with the assumption that education means skills which correlate to programme “outcomes” at a certain defined level, means that a thorough reversal or re-imagining of the nature and form of higher education may be needed to prime the system for the 4IR and make a discernible impact on the employability of students in the system. The net result of current regulatory and quality assurance processes is to frustrate institutions trying to respond dexterously to emerging societal needs (2019, pp. 7–8).

Attention to these issues must be tempered by the realization that the interventions are not a panacea for resolving development challenges. Vally and Motala caution that education does not guarantee full employment and that an instrumentalist view is unhelpful especially as it is always based on a raft of unjustified claims about the outcomes of education and skills in capitalist societies; that education and training is not simply a handmaiden for resolving the problems of low economic output; and that

a wide range of exogenous factors and social relations ... circumscribe the potential value of education and training (2014, pp. 31–32).

A constantly shifting 4IR landscape makes it difficult to predict the skills and capabilities demanded from graduates when they start work. Jørgensen suggests that universities should proactively “change the content of their teaching (including lifelong learning), adding new study programs and new curricula, including data literacy. This can include common courses in basic digital literacy for all students” (2019, p. 6).

Finally, the challenges of change and adaptation fall on individuals who also need to adapt and become resilient in a changing, complex and uncertain future. Barber et al. argue that citizens must take responsibility for themselves and their world and constantly learn and relearn, applying their knowledge to present and future problems (2013). Marwala also argues compellingly for individual and institutional responsibility: “The education system at all levels must promote problem-solving skills, computational thinking, multi-disciplinary skills and systems-thinking, while equipping our students to master the social, economic and political worlds” (2020a, p. 27). This increased drive to develop “individual responsibility” should not obscure the importance of enhancing collective social outcomes and using the 4IR to support, and not hinder, improved livelihoods and social justice.

Conclusion

A developing economy and relatively young democracy with enormous socio-economic challenges, South Africa is still on a steep developmental trajectory. How it harnesses technologies, especially those of the 4IR, to embrace new possibilities for development, will determine whether it leaps toward being a developed economy; plods along lethargically; or, at worst, stagnates or regresses. Addressing the numerous policy, regulatory, funding and planning challenges at national level is therefore crucial to the success of its developmental aspirations. The COVID-19 pandemic's negative effects on the economy, livelihoods and society are yet to be fully measured. It is clear though that it would be short-sighted not to give the required attention to the potential and perils of the 4IR for our society and economy.

While HEIs grapple with equipping graduates, employers have the related challenge of remaining competitive while harnessing emerging technologies, which may well have negative consequences for jobseekers (Peters, 2019, p. 1). It is apparent that there is a real possibility that the 4IR could lead to increased unemployment and poverty, deepening inequalities, more state control, and pervasive economic exploitation. These possibilities contrast with the upsurge in development, better economic prospects and achievement of development goals stemming from the 4IR, as detailed in the PC4IR (2020). Thoughtful negotiation of these tensions is necessary to ensure that universities are able to be responsive to a changing world in all its challenges and opportunities.

Introduction

The line between the various delivery modalities of teaching and learning has blurred in recent times (Lockee, 2021). Defining what constitutes concepts such as traditional face-to-face residential teaching, blended learning, flexible learning, HyFlex learning, distance education and fully online learning has become increasingly complex. The traditional divide between contact and distance education modes in higher education institutions (HEIs) has become less obvious as many institutions opt for a more nuanced approach that allows for the inclusion of various combinations of delivery modalities in a single program. This trend is not limited to residential institutions only, as traditionally distance education institutions also seem to embrace a variety of modes, for example in offering face-to-face tutor sessions, or on-site examinations (UNISA, 2022).

Even before the COVID-19 pandemic forced HEIs to convert their traditional face-to-face offerings into emergency remote teaching (Hodges et al., 2020), many institutions considered offering academic programs in a more flexible delivery mode. In the process, the distinct differences between traditional residential contact teaching and learning on the one side of the spectrum, and fully online distance education on the other, became nebulous.

This article explores the various elements to be considered when a traditionally residential HEI moves into the fully online distance education arena. A conceptual framework is proposed for the introduction of fully online distance education at higher education institutions.

Background

Fully online distance education refers to a modality of teaching and learning where students enroll for a formal academic qualification at a higher education institution and where the program that they enroll for is offered virtually. This means the student never need to travel to a physical campus to attend class or practical sessions, or to write exams. There are several reasons why fully online distance education has been regarded as an attractive option in recent years.

Because of the widening gap in wages and salaries for workers with different levels of post-school qualifications, more and more school leavers in South Africa are applying to enter university programs in an attempt to increase their social mobility (Li, 2013). This need for equity, social justice and democracy to deal with the injustices brought about by the apartheid system, coupled with the need to equip people with high-level skills to meet the employment needs of the public and private sectors, caused an alarming increase in the demand for higher education in South Africa (DHET, 2021). Certain programs are specifically high in demand, albeit because of the social aspirations of parents and caregivers, or because of perceptions that certain types of qualifications are more meaningful than others (Li, 2013).

Whatever their reasons, approximately 1.2 million school leavers enrolled at public institutions of higher learning in 2019 (DHET, 2021). In the South African context, the country's 26 public higher education institutions have struggled for many years to provide access to this ever-increasing number of school leavers who aspire to obtain a qualification at the university level (DHET, 2022a; Regenesys Business School, 2019). However, the high demand for access to universities has not been accommodated for various reasons, including limited physical space in lecture halls and laboratories (Malele, 2011; Saaid et al., 2018). Besides the physical constraint in terms of academic spaces, universities also struggle to keep up with the demands for formal and informal student accommodation in residences or near campus (DHET, 2011). In 2022, the University Student Housing Survey found only a total capacity of 287 507 beds at universities around the country (Cloete, 2022).

In some cases, the demand for access is focused on a particular institution, for instance, where the institution's brand is specifically desirable due to its rankings on a particular world ranking system (Bridgestock, 2022), or simply because of its geographic proximity. Other reasons for high demand may include the cost of the tuition fees for an academic program (NSFAS, 2022) or its attainable entry requirements as measured in an admission point score (APS) (SABursaries, 2022). Still, other prospective students prefer to pursue their studies at a particular institution due to the reputation of a specific academic department, program or even a distinguished professor (Bhardwa, 2017).

Since the demand for the available spaces in popular higher education programs typically outweighs the supply (Li, 2013), universities are notoriously bad at marketing their academic offerings. There seems to be a general belief that prospective students will automatically be drawn to an institutional website where they will find all the relevant information about an academic offering. The belief also seems to be that prospective students will manage to find their way through the maze of an unfriendly institutional student management system, such as PeopleSoft (Oracle PeopleSoft Applications, 2022) and ITS (Govender, 2022), to apply for the program and residence of their choice. Apart from generic marketing and awareness drives (Van der Walde and Bonnema, 2007), such as informational websites, information brochures, open days and school career fairs, very few academic program coordinators ever feel the need to advertise their programs since the demand for spaces normally outweighs those which are available.

Academic program coordinators often put a cap on student numbers to be accommodated in their programs in any given year, as they have to juggle all the variables, including the number of academic staff members available to teach the modules, the administrative and professional staff to support the students throughout their studies, the number of seats available in lecture halls, the capacity of the computer and other laboratories, and the availability of hard copy text books in the library, to name but a few (Saaid et al., 2018; Malele, 2011; Regenesys Business School, 2019). As such, there is seldom a need for additional marketing initiatives, as program coordinators can pick and choose from the available candidates. To ensure that it isn't simply a matter of first come, first serve, academic program coordinators often put specific selection mechanisms in place to ensure that the process results in selecting students who are most likely to succeed. As a result, many deserving students who qualify for access may miss out on being selected for the few coveted spots in a particular program.

Fully online distance education

To accommodate more students, some South African universities have started to consider fully online distance education as an addition to the normal residential offerings (University of Johannesburg, 2022; University of Pretoria, 2022; University of the Free State, 2022; University of the Witwatersrand, 2022). With advances in technology and increased availability of computing devices such as laptops, and Internet access, fully online distance education has now become an option for universities strapped for space (Manichander, 2020; Graham, 2006). It is obvious that not all academic programs lend themselves to a fully online distance delivery modality, but for those that do, this type of offering may just bring much-needed relief (Altbach and De Wit, 2020).

Studying fully online means a student never need access to a physical campus or other learning facilities for teaching, learning, or assessment purposes (Vaughan, 2010). A fully online student only needs a reliable computer and stable internet access. Since these students don't need to attend physical lectures on campus, the HEI can support significantly more students without investing in new buildings, research facilities and larger auditoria (Mukhtar et al., 2020). Fully online distance education effectively eliminates the additional strain on the available facilities and physical environment that extra residential students would have entailed (Rolheiser et al., 2019).

Along with increased access for local students, the fully online distance education modality also allows HEIs to expand their geographical reach nationally to other provinces and internationally to other countries (CHE, 2004; Lederman, 2020). Normally, when international students choose to study abroad at one of the South African HEIs, they need to resign from their full-time jobs in their country of origin, obtain study visas and medical insurance, leave their families behind, and move to a foreign country. There, they have to support themselves financially as full-time students, and pay their tuition fees and associated costs, such as textbooks and software (Khanal and Gaulee, 2019). Fully online studies, however, mean that international students can remain in their country of origin, retain their full-time jobs, and remain in touch with their loved ones, while still furthering their studies at a university of their choice.

As many traditional universities in South Africa have an overt ambition to be recognized as research-intensive (BusinessTech, 2021; University of Pretoria, 2011), institutions of higher learning typically want to be able to accommodate a larger number of students in their postgraduate programs. As postgraduate studies target an older student population (DHET, 2021), these students are often working adults with established careers and family commitments. As such, the fully online mode of delivery is potentially a good fit as students can study asynchronously in the evenings or over weekends, despite working a full 40-h work week (Arghode et al., 2017). Fully online distance education eliminates the need for daily residential-class attendance. It also eliminates the need for students to attend evening, or block classes, which may have entailed long hours on the road, and may have required the student to take a leave of absence from their work (Appanna, 2008).

Because fully online distance education opens up the way for more international and postgraduate students to further their studies, the potential for larger numbers in these two categories may influence the ranking of an HEI. In higher education, rankings are important as prospective students often use them as a decision-making tool when choosing an institution to further their studies at (Bridgestock, 2022; Lubacz, 2022). The visibility of an HE institution's brand increases with a good ranking, and therefore institutions often use their ranking for marketing and publicity purposes. Favourable rankings furthermore increase the likelihood of

partnerships and collaboration with other prestigious institutions abroad, thus further improving an institution's reputation and ability to attract top students and staff alike (Lubacz, 2022).

However, this need must be carefully balanced with the workload of an already burdened staff component (Braat, 2021). Academic staff are notoriously under pressure due to the demands to publish, supervise postgraduate students, teach large groups of undergraduate students, and be involved in their local communities (Karma et al., 2021). As such, any changes in the usual way of doing things are experienced as time-consuming and stressful, and require a careful change management strategy to ensure buy-in and commitment.

With the potential for increased student numbers, fully online distance education offers institutions the ability to increase their revenue in tuition fees and state subsidies. Even though the current Department of Higher Education and Training (DHET) funding formulae dictate that input subsidies for distance education are only half that of residential studies (DHET, 2022b), distance education programs can accommodate a larger student population tends to balance it out. It is foreseen, though, that the latest blurring of the modality lines may require legislative bodies such as DHET and the Council on Higher Education to review and renew their funding and accreditation policies.

As many South African institutions are still reeling financially after the #FeesMustFall drive in 2016, the recent COVID-19 pandemic, global wars, and the effect thereof on the ever-increasing cost of living, HEIs welcome any initiatives that could potentially generate an additional stream of income. As such, the revenue generated by fully online distance education programs is an attractive by-product, even if generating funds is not the driving force behind taking academic programs fully online. Since fully online distance education is particularly suited to fit the lifestyle of postgraduate students, an increase in these student numbers is especially welcome, seeing that postgraduate programs generate more subsidies than those for undergraduate programs (DHET, 2022b).

Finally, it is important to consider the needs and context of the student body. Most HEIs claim to be student-centered in their academic offerings (Weimer, 2002; Wright, 2011). The flexibility that fully online distance education offers means that students can fit their studies into their normal daily routines without having to deal with the normal disruptions if they needed to attend classes on a physical campus (Naidu, 2017). The flexibility to learn whenever and wherever it suits the student must be one of the most attractive attributes of a fully online academic program (Tait and Mills, 2002).

Due to the reasons discussed above, it is clear why so many traditional HEIs choose to include fully online distance education programs in their program qualification mix (PQM) (Nel, 2014). However, with only one distance education institution in the country, it is evident that there is not a lot of expertise available to draw from when a traditionally residential institution wishes to embark on a fully online distance education journey. Furthermore, the systems that work well in a face-to-face contact environment may not be as efficient and effective if transferred to a fully online distance environment (Kumari et al., 2021). As such, the question arises as to whether a framework is available to guide the implementation of fully online distance education programs in a traditionally residential institution.

Method

Following a design thinking process (Brown, 2008; Liedtka, 2018; Owen, 2007; Rowe, 1987), the study was undertaken at a traditional residential university in South Africa that had recently decided to branch out into offering fully online distance education programs as well. As a traditional residential university, neither the academic nor the professional staff (administrative and support) fully grasped the radical differences between normal contact offerings and those in a distance education mode. The research team had to set aside their assumptions about the world (Sharlip, 2019) and actively seek insight into the needs of fully online students, as well as the staff that were going to be involved at each of the touch points in these students' academic journeys.

The design thinking process that was followed included six distinct phases (see Fig. 1). After an extensive review of existing literature and an intense benchmarking exercise (empathize phase) that included exploratory visits to other higher education institutions nationally and internationally, a special project was launched. The project had to investigate, design and pilot a system to allow the university to offer fully online distance programs in a way that was aligned with the values and standards of the normal residential programs. A number of internal stakeholders were identified (define and ideate phases), and they represented several areas in the university, including: student administration, finances, information technology, marketing, academic planning and academic faculties. Multiple interviews, brainstorming sessions, and workshops were held with these stakeholders to ensure that the problems were captured and defined (define phase), after which possible solutions and required elements were identified (ideate phase).

After much investigation and back-and-forth scrutiny, the proposed framework for fully online distance education was drafted (prototype phase). It was then submitted to several test and revision runs (test phase). Once all the obvious issues were ironed out, the framework was formally introduced when the first two fully online programs went live (implementation phase).

The non-linear, iterative, and sometimes chaotic design thinking process that was followed by the team allowed for a better understanding of the problem (Braha and Reich, 2003; The Interaction Design Foundation, 2022). It also allowed for the redefinition of the problem and the provision of creative solutions. The analytic and creative design thinking process that was followed allowed the team to experiment and come up with a design for a prototype framework, and to gather feedback, redesign and modify where it was necessary (Razzouk and Shute, 2012; Rowe, 1987). The methodology suited the complex problem well, as it is a natural fit with qualitative research. The design thinking nature of the methodology, as a human-centered and empirical research method

Fig. 1 Design thinking process.

that employed interviews, workshops, brainstorming sessions, and focus groups, proved effective in coming up with a framework for fully online distance education (Brown 2008; Moran, 2021). What started as a cloudy idea of what the framework should look like (Dorner, 1999), with time, crystallized and transformed into a clear image of the framework presented below.

Features of the fully online distance education framework

The proposed framework for fully online distance education at a higher education institution is characterized by several distinct features (see Fig. 2). These features constitute the backbone of the framework, and all work together to provide the student with the best learning experience possible. The ultimate aim is to ensure student success.

Firstly, it is important to recognize that the discussion is not about fully online short courses, but fully-fledged accredited academic programs. In the South African context, it means that these programs are approved by the Department for Higher Education (DHET), accredited by the Council for Higher Education (CHE), and registered by the South African Quality Authority (SAQA).

Secondly, these programs are offered fully online, implying that a student in one of these programs never needs to attend classes or practical sessions in a physical location, such as a campus or a designated meeting space. All assessment activities are also taking place online, and as such, it is never a requirement for a student to show up in person at a physical venue, not even for graduation purposes. Students get access to their study material, all learning activities and assessment opportunities in an online virtual environment, such as a learning management system (LMS). The benefits of this feature are clear, as working adults, those with financial or time constraints, and international students alike, appreciate that traveling and synchronous contact time is no longer a prerequisite.

The third feature entails multiple intakes per year. This means that students are no longer bound to wait till the beginning of an academic year (January in the South African context), but can start their studies at various points throughout the year. In this study, the system was set up to accommodate six intakes per year. The implication is that prospective students can theoretically start their first module within two months after applying.

Even though there are exceptions to the rule, modules are offered linearly, one after the other, and are facilitated over eight weeks. The first seven weeks are meant for academic engagement and assessment, and the final week is a rest period for the students, whereas the lecturing staff finalize the grading of assessments and calculation of final marks. Students also use this week to register and pay for their next module in the cycle. This fourth feature allows students to focus all their study time on a single module, without the distraction of clashing tests and assignment due dates as would have been the case if they had to focus on multiple modules running concurrently.

While it is assumed that working adults will choose the option to study part-time and therefore take only one module at a time, nothing prevents a department from offering a fully online program as a full-time option as well. In such a scenario, students may then be required to register for two or more modules concurrently.

Fig. 2 Fully online distance education framework.

Because bursars often choose to fund students for their first degrees only (NSFAS, 2022), tuition fees can become an insurmountable barrier for prospective students. In the proposed model, students only pay for the module they are currently registering for. As the modules run over eight weeks, they can put money away to pay for their further online studies. This feature also benefits the university, as students who haven't paid for a module are not given access, thus ensuring there is no bad student debt.

The final feature of the proposed fully online distance education framework is that prospective students must have access to a computer and a reliable Internet connection during the time available to spend on their studies. While some learning materials and activities can be accessed on devices like mobile phones and tablets; most academic modules will require students to submit written assignments which would require access to a computer. Some modules may include synchronous virtual sessions, but synchronicity is not encouraged in most cases due to differing time zones and work hours.

The framework identifies four stages: marketing, onboarding, academic offering, and graduation, taking the life cycle of a fully online distance program into account. These stages are unpacked below to highlight the practices experienced at the university where the study was undertaken.

Marketing

Universities all have various marketing initiatives, including websites, brochures, booklets, open days, and talks at schools and career fairs (Kieu et al., 2020; Van der Walldt and Bonnema, 2007). In the proposed framework for fully online distance education, these activities were still utilized to include the new fully online programs. Great care was taken to distinguish the residential offerings from those that did not require students to come to campus. A rather aggressive marketing campaign was also launched via various social media outlets, including LinkedIn and Facebook, as it was assumed that users of these platforms were already comfortable using technology in their everyday lives.

Onboarding process

The university in question had already transitioned to an online application process several years ago. During the pandemic, this early adoption of the available technologies came in handy since most systems were already set up to accommodate online

onboarding. However, since there were significant differences between established processes for the normal residential programs and the new ones for the fully online programs, a major revamp of the information management system was required. With six intakes per year and a payment model where students only pay for one module at a time, the programming and IT development team had to develop several new systems from scratch. In the end, the new application process for the fully online students accommodated all the onboarding processes online, with no need for students to come and queue at the administrative offices on campus. Even the contract that students sign with the university was adjusted to avoid having to submit the physical signed copy. As far as possible, though, the onboarding process for fully online students aligned with those involved in getting the residential students onboard.

The normal application process was, for example, revisited to include a step where an Onboarding Specialist called prospective students as soon as they showed interest in studying online. During these calls, the Onboarding Specialist did an initial vetting of the prospective student to ensure that they understood that the program they were interested in was offered online only and that they, at least at face value, complied with the minimum requirements to gain entry into the program.

After a prospective student passed the initial vetting, they received an email with all the necessary application instructions. Students would then apply and upload all the evidence and proof that they complied with the minimum requirements. Once the Student Administration team checked the documents for legibility and completeness, a list of vetted applicants would be referred to the Academic Program Coordinator, usually the lead lecturer in the program, to select those students who, according to them, complied with the requirements and were to be admitted to the program. Because physical space was no longer an issue, all qualifying students were admitted. The only other concern regarding large class sizes is the lecturer-to-student ratios, which will be discussed later in this article. At this point, the Student Administration Team would then admit the successful students and inform them by email on how to enroll on the program and how to pay and register for the first module.

At the time of this study, the university was not yet offering any fully online distance programs on a full-time basis. As such, students were only allowed to register for one module at a time. The model also worked well financially since students only needed to pay for the module they intended to take next. The costs for each module were not relative to the number of credits, but rather standardized to allow working adults to plan their budgets effectively. The standardization was done by dividing the total cost for the program equally into the number of modules.

Since each module was offered over a fixed period of eight weeks, employed students typically had at least two paychecks before they had to pay for the next module. For many, this eliminated the need to approach a financial institution for a study loan. Some students were fortunate enough to be in a position to pay in full or had their studies subsidized by their employers or other bursars. For those students, the option to pay the total amount for the entire program upfront still existed.

The university required that all students pay in full for the module they intended to take before or on the day the module started. If the tuition fees did not appear in the student's account after five days, their access to the module was blocked. At that time, the Onboarding Specialist would follow up with the student, telephonically or by email, requesting them to upload their proof of payment. Once the proof was provided, the student's access was then reinstated. If the tuition fees still did not reflect in the student's account by day ten, the student was dropped from the module altogether. The student could then save up the necessary fees, and once they paid in full for at least one module, they could join the next module, which always started a maximum of eight weeks later.

Academic offerings

Because lecturing staff at traditional residential universities are not necessarily familiar with the pedagogical underpinnings required for fully online distance teaching and learning, each online module was developed by a team consisting of subject matter experts who brought the discipline knowledge and a learning designer who focused on the andragogical needs of adult learners who study over a distance. In some cases, a curriculum design expert, a graphic designer, an intern, and/or a language editor were also added to the development team. Developing the online version of the modules typically ran over a minimum of six months, indicating the depth and scope of the development work required to produce a solid online learning experience. The end products, though, were highly interactive, well-structured, and engaging online modules that provided multiple opportunities for interaction with fellow students, tutors, teaching assistants, the lecturing staff, and guest presenters.

Each module was structured to run over seven full weeks, Monday to Sunday, followed by a one-week break before the next module commenced. On the Monday of each week, the week's learning outcomes were released, together with the learning activities and assignments that needed to be completed that week. Students could then access their module on a Monday and plan their workload according to their own schedules, resulting in students working during the early hours of the morning, late at night, or at differing hours over the weekends. The due dates for assignments were typically scheduled for midnight on the Sunday evening before the next week's materials and activities were released the next day. As such, the modules could be described as 'semi-synchronous' in nature, as students were all engaging with the learning outcomes of a particular week at the same time (synchronous), but focusing on their studies at different times during that week (asynchronous).

Some lecturers opted to facilitate a synchronous contact session online to kick off the work each week (typically on a Monday evening). During that time, they briefly introduced the topics covered that week and reviewed their expectations regarding the assignments. These sessions were never compulsory, though, seeing that there could be a multitude of reasons why students would not be able to attend, for example, being in another time zone or having to participate in a parent evening at school. For that reason,

the sessions were always recorded and made available online immediately afterward, so that students who missed the session could still work through them whenever they had the time. Most lecturers however pre-recorded their introductory lectures and then provided students with the opportunity to ask questions in an online discussion space that became known as the 'Emergency Room'.

All modules had an Emergency Room built in as a standard feature. The understanding was that this space was to be used when students had questions regarding the content, module design, assessment activities, or any other challenges they could not solve among themselves. The lecturers, tutors and teaching assistants all checked into the emergency room at least twice a day to ensure that students received high-quality feedback as soon as possible, preferably within 12 h of posting their questions.

To encourage the principle of 'Ask three, then me', a 'Coffee Shop' discussion forum was also created in all online modules, where students could converse with their peers in the module. The students were encouraged to discuss any topic of their choice and use the Coffee Shop as a space where they could network, exchange ideas, and freely share their points of view. The members of the lecturing team did not have a presence in this discussion forum. It was intended for students to meet one another online and share their experiences, ask each other questions, and provide peer support. This discussion forum aimed to promote the formation of a supportive online community of practice (Wenger-Trayner and Wenger-Trayner, 2015). It was, furthermore, intended to provide students with a safe place where they could vent their frustrations and celebrate their achievements with the group.

Since one of the reasons the university opted to introduce fully online distance programs was to grow student numbers in their postgraduate programs, it was not preferred to cap the number of students in any of the fully online programs. The main concern, however, was always the ratio of students to lecturers, mainly due to the workload associated with the grading of assignments and learning activities, and the short turn-around time that the weekly structure of the modules and the seven-week time frame allowed for this purpose. In such a tight, condensed schedule, students needed quick and regular formative feedback on their assignments and work, seeing that they needed to learn from their mistakes to make good progress in the following weeks. As such, there was pressure on the lecturing staff to grade assignments and learning activities in the week after they were submitted. For that reason, the university decided to work on a ratio of 50 students to one lecturer. Once the 50 mark was reached, a lecturer had the option to appoint either tutors or teaching assistants to help with various tasks, including grading, responding to student questions, and providing guidance when it became obvious, for example, in the online discussions, that students were on the wrong track.

Seed funding was made available to appoint these tutors and teaching assistants for the first year that a fully online distance program ran to ensure that the quality of the learning experience was not hampered by the lack of time on the lecturers' side. All the learning assignments and experiences were, therefore, consciously designed to ensure that the lecturing team members would each be able to complete all the grading of at least 50 students within a week. After the first year, the tuition income generated by the program was normally sufficient to ensure that the program itself could carry the costs for the teaching assistants and tutors.

Some assessment activities were designed to be marked automatically by the computer. In these types of assessments, great care was taken to ensure that the automated feedback provided by the computer was thorough and formative by nature. The time-consuming nature of developing such detailed feedback contributed to the lengthy module development time as indicated earlier.

Support structures

As distance education can be an isolating and lonely experience (Rush, 2015; Stewart and Lowenthal, 2022), it was important to build in structures for administrative, emotional, academic, and technical support. Prospective students often find the application processes of higher education institutions awkward, inconvenient and unfriendly. When they get stuck on a particular section of the application form, there is usually not an easy just-in-time contact person on standby to assist. Therefore, in an attempt to ensure that all students who showed interest and qualified for the fully online distance programs could apply with ease, the online system was streamlined to be student-centered, as far as the rather rigid parameters of the student management system allowed.

However, there was an obvious need for additional human support in case a prospective student was unsure about the next step, or had technical difficulties uploading a particular document. As such, the Onboarding Specialist was made available, and their contact details were clearly displayed for easy contact. The Onboarding Specialist could typically respond to all the prospective students' questions about the fully online program and the onboarding process. This person also had access to the students' application data online and could see if and where they got bogged down in the process. The Onboarding Specialist were tasked to contact students who, according to the system, started an application but did not complete it, and offer them guidance and support. It was found that this simple touch of 'customer service' went a long way in ensuring that the realization rate of leads (in this case prospective students who had shown an interest in the fully online program), increased.

Once a student was admitted and officially enrolled for the fully online program, they were then handed over to a Student Success Coordinator. This person's role was to support the student throughout their studies regarding any queries they may have. Having set up the online system to flag students who did not log into the learning management systems for a couple of days, the Student Success Coordinator would typically contact students who fall behind to find out what challenges they experienced. If the problems were academic, they would be referred to the lecturing team. However, the Student Success Coordinator often simply provided an empathetic ear to students who struggled with time management, or other personal matters in their day-to-day lives. They also offer various support services, including entry-level technical support, informational support, e.g., how to pay and register for their next module, and, as mentioned, a motivational role of encouragement when students struggled emotionally.

The lecturing team consisted of the main lecturer (the facilitator), typically a seasoned subject-matter expert. As soon as the number of students exceeded 50 (and in increments of 50), additional tutors and/or teaching assistants were appointed to assist with responding to student queries and grading assignments. The lecturing team underwent some training before a module went live for the first time and was made aware of the significant differences between teaching in a normal residential program as opposed to a fully online distance one.

The lecturing team often needed support in the first six months when the fully online module had to be developed and during the first couple of times that a module was offered. In this capacity, the Learning Designers had a vital role to play. Providing pedagogical and andragogical guidance to the subject matter experts, who often had limited teaching experience in an online environment, was essential during the development phase. They often also needed the input and guidance of a curriculum development expert during the development phase. Once the modules went live, lecturers often encountered unforeseen technical difficulties, for which the Learning Designers had to be on standby. From time to time, learning activities didn't work as well as intended, and lecturers needed to fix things in real-time. The Learning Designers then provided moral and technical support to the lecturers, and provided educational advice. They also reminded the lecturing team of the importance of having an online presence and the value of high-quality, just-in-time feedback to student queries.

Graduation

Once a student had successfully completed all the required academic modules, they graduated with a fully recognized and accredited higher education qualification. Successful students were then allowed to either attend the formal graduation ceremony on campus, or receive their degree certificate via the post. Interestingly, despite their choice to study remotely, most students in the first graduating cohort elected to attend the graduation ceremony in person.

Conclusion

As the lines between the different delivery modes for teaching and learning blended with time, this article explored the various elements that need to be considered when a traditional residential higher education institution moves into the fully online distance education space. A conceptual framework was proposed to introduce fully online distance programs at a higher education institution. The framework highlighted the features to be considered and described the details of the processes involved as they played out at the institution where the research was undertaken. Higher Education institutions in South Africa will be looking forward in anticipation to see how legislative bodies such as DHET and the CHE respond to the recent shifts in teaching and learning modalities going forward.

Introduction

Education in the post-Covid-19 era

The COVID-19 pandemic has shone a bright light on humanity's flaws and obstacles. It has further emphasized the current inequalities in different fields including education—the most important of which is to think of future education in emergencies and uncertainties, due to that the COVID-19 has disrupted the learning of more than 1.6 billion children (UNESCO, 2021; UNICEF, 2021). The world is now steadily returning from the global pandemic, where students are increasingly returning to campus in Europe, while online courses continue to be offered (Birnbaum, 2020). However due to travel constraints, international students are stranded either in their destination country or their home country, taking online courses to resume their studies (China, 2020). Most colleges in the United States have announced that online courses will continue to be available after 2020, with fewer in-person options. China, on the other hand, has reopened schools and universities (Time, 2021) while India (Express, 2021) has resumed in-person classes for senior students. Schools and colleges are taking numerous precautions concerning these in-person courses. For example, classroom seatings were spread out to keep social distancing, and class enrollment capacity were decreased (Guthrie et al., 2021).

COVID-19s impact on education has created several issues in the post-COVID-19 environment. Now, teachers have to offer the same course two times: face to face and online for those students who cannot attend face-to-face classes (TUoEB, 2021). However, separating students into offline and online classrooms to study independently may limit class interaction and efficiency, which might have a detrimental influence on academic performance (Keržič et al., 2021; Shanta, 2022).

Recently, the Online merge Offline (OMO) Learning (Huang et al., 2021) concept has emerged and opened new doors for more immersive and flexible learning experiences by overcoming many of the educational challenges in the post- COVID-19 era. OMO learning is “a learning model that relies on hybrid infrastructure and open educational practices to merge online and offline (i.e., physical classrooms) learning spaces together in real-time while simultaneously seamlessly teaching students in both the physical classroom and online” (Huang et al., 2021, p. 17).

As Fig. 1 shows, the typical OMO learning environment should have (Huang et al., 2021): (1) internet connection to connect both offline and online students together. For instance, ClassinX, an educational platform, was used to connect both students together; (2) An interactive smart screen, allowing the teacher to simultaneously instruct online and offline students together; (3) cameras to capture, record, and transmit the classroom activities for the online participants; (4) sound system to transmit the voice of instructor and students; and, (5) tablets which are optional and can be used for a variety of instructional activities.

In OMO learning, the students share the learning process by combining two distinct but interconnected environments (physical and online) with the help of innovative technologies and instructional approaches. In addition, for improved learning outcomes in OMO learning, the instructor must design learning activities that encourage interaction, as well as collaboration between online and offline students together (Huang et al., 2021). This ensures that technology and open educational tools not only aid teaching and learning processes, but also promote collaboration and engagement among teachers and students (both online and offline), even if

Fig. 1 OMO classroom (Huang et al., 2021).

they are in separate learning spaces (Huang et al., 2021). The objective is to have an immersive and authentic learning opportunities even for those students who are online.

Research motivations and objectives

Traditional methods of online teaching are evolving with the design of more interactive learning spaces and guidelines that facilitate student discussion and collaboration (Wang et al., 2020). Bower et al. (2017) found that evidence-based collaborative technologies will become invisible that students and teachers interacting from different locations will feel that they are in the same room. However, the changes in instructional approaches and the use of new technologies need further planning and coordination (Bower et al., 2015; Wiles and Ball, 2013). A systematic design of the learning environment is therefore needed by identifying relevant areas and success factors that support the design process of these environments. Within such framework, educationalists will be able to create a meaningful OMO learning, based on conceptual, human-centered, and didactic principles. Similarly, Wolff (2020) indicated that careful selection of instructional approaches, facilities, and technology is required for ensuring long-term education. For this, more attention should be paid for designing OMO learning environments to ensure an effective teaching and learning processes. In this context, UNESCO (2020) has emphasized the need of investigating future learning environments to ensure the continuity of education in times of uncertainties. Specifically, this study answers the following research questions:

RQ1. What types of learning strategies have been implemented in OMO Learning?

RQ 2. What are the functions of technology in OMO learning?

RQ3. How OMO learning spaces are designed?

Case study collection

To answer the above research questions, several OMO learning case studies have been collected from different contexts in the post-COVID-19 era. The collection process is detailed in the Method section.

Case study 1

In the first case study shown in Fig. 2A course name "Design and Learning" was taught jointly within 11 universities in China. An OMO (Online merge offline) model was used where 75 (50 online and 25 offline) students participated in this course.

Group discussion between both online and offline students, as well as inquiry-based pedagogy were used by incorporating different technologies, such as cameras, interactive screen, ClassInX (Teaching assistant software), courseware, content editing software, customize blackboard layout, IPad, and teaching assistant software.

The classroom was equipped with an interactive screen to design learning activities for both online and offline participants (in the physical classroom) where they work simultaneously by making groups. Regardless of the learning area, this approach can facilitate the learning interaction between online and offline students at the same time. The online students can also watch the learning activity live and receive oral feedback from their teacher and their offline and online classmates at the same time. The classroom was also equipped with ClassInX, a smart tool, which contains an open educational resource repository that teachers may utilize when

Fig. 2 OMO classroom environment for “Design and Learning” course.

preparing their teaching materials. The students, on the other hand, can work on the teaching materials and update them, attribute an open license for them, and save them on the cloud. This allows these revised teaching materials to be revised by the students themselves, their peers or teachers.

Case study 2

In the second case study, Mr. Ahmed (a pseudonym) taught English communication skills as a subject in one of the universities in Pakistan, as shown in Fig. 3.

There was a total of 60 students (30 online and 30 offline) attended the course. Several technologies like ZOOM, large touch screen, Multi-finger gesture, small blackboard, courseware display, and breakup rooms were incorporated in the teaching and learning processes. For synchronized online discussion and communication between online and offline students, teachers used Zoom. They also used a large touch screen where the Zoom tool was running. This screen was visible to both online and offline students simultaneously. A Group of face-face and online students were asked to discuss and perform group activities by using “Breakout Rooms” in ZOOM. The teachers used Google classroom as a courseware and an Learning Management System to provide online content and learning material to both online and offline students. The teacher used Google cloud and the PADLET (A web Application) to perform collaborative activities among students at both ends (online and offline). A sound system was installed to provide clear audio, hence facilitate the interaction and communication between the teacher and the students (online and offline).

Case study 3

In the third case study, Mr. Chuhan (a pseudonym) an instructor from one of the prestigious institutes in Singapore, taught Mathematics as a subject to the 9th and 10th-grade students by using VOOV meetings. Total 170 students (100 online and 70 offline) attended those subjects.

Fig. 3 OMO classroom environment to teach English communication skills.

The groups of online peering with offline students were formed for collaborative activities by using PADLET a web application. 45 participants attended this session. The teacher made groups of offline and online students for discussion. The other technologies e.g., Digital Cameras were also installed to capture the movement of instructor and offline students activities from online students. The VOOV which is an online meeting app was running on an Interactive touch screen from offline students, GeoGebra (online application) was integrated to teach mathematics-related concepts to both online and offline students at the same time. The learning analytics plugin was enabled to track the collaborative activities of online and offline students.

Case study 4

In the final case study, the instructor in Spain taught social studies subjects to the seventh-grade students using ZOOM and Google meet to interact with online students. There were a total of 45 (25 online and 20 offline) students who attended the class. The other technologies and apps like JAM BOARD, Digital cameras, Sound system, PADLET, EDMODO (A web based Social Learning management system), and video recording apps were integrated into the learning environment.

Students were asked to work on assigned projects by making groups of 3–4 online students peering with offline students. JAM BOARD was shared among online and offline students at the same time. The teacher also used the PADLET as an alternative to JAM BOARD for interactive and collaborative activities and group discussion. Additionally, the teacher created breakout rooms in Google meet for collaborative assignments.

Method

This study used a collective case study technique, which followed conventional case study data gathering and analysis technique (Yin, 2009). Particularly, a call for case studies about educational institutes that have implemented OMO learning has been shared through the professional network of the authors. In this call, each educator had to describe his/her case study aligned with the 5 OMO learning characteristics presented by Huang et al. (2021): (1) Hybrid infrastructure (2) Extended learning space regardless of students (3) Suitable and interactive (open) resources; (4) Open and flexible educational practice and (5) A set of comprehensive competencies of teachers and students to design OMO learning infrastructure). A case study is considered valid if it is: (1) aligned with the OMO definition by Huang et al. (2021); (2) empirical, (3) used for teaching or learning; and (3) well detailed for further analysis. Four case studies were finally selected for analysis and evaluation. Initial shortlisting of the cases was done primarily based on their validity criteria.

Analysis of each case study was conducted iteratively based on each of the aforementioned research questions (Bower et al., 2015). The coded data were then evaluated and cross-checked by the authors to ensure that the study's themes were consistent. Table 1 presents the extracted data from each case study.

Results

What types of learning strategies have been implemented in OMO learning?

The teachers applied different learning strategies to provide an immersive and interactive OMO learning experiences. The following extracted learning strategies were classified according to the Technology Integration Matrix (TIM) along with ISTE Standards (Winkelman, 2020), namely: Active, Authentic, Collaborative, goal-directed and Constructive learning.

1. *Active Learning*: To promote engagements and active learning, the teachers attempted to design student-centered activities by, for instance, asking students to enrich the provided learning materials with more examples from their personal understanding of the discussed learning concept. This made students more engaged to learn, rather than being passive consumers of the information.
2. *Collaborative Learning*: In the OMO learning, collaborative learning is one of the strategies applied by teachers. Collaborative learning is a teaching method that includes students working in groups to improve their learning. For instance, in the first case study, the teacher made breakout rooms where both offline and online student can join these rooms to finish different learning activities.
3. *Authentic Learning*: The Authentic feature highlights the link between new learning and the real world (Winkelman, 2021). In OMO Learning, teachers used storytelling techniques to make learning meaningful. Additionally, the use of different cameras and interaction methods between offline and online students made learning authentic even for those who are online (i.e., they felt that they are with their classmates offline).
4. *Goal-Directed Learning*: The Goal-Directed characteristic describes how technology is used to set goals, plan activities, monitor progress, and evaluate results (Florida Center for Instructional, 2021). This examines how well technology aids, enables or supports meaningful reflection as well as metacognition. In one of the case studies in the OMO environment, Learning Analytics (LA) has been used to monitor and track students learning behavior. Although teachers generally appreciated the benefits of integrating technologies in the OMO learning environment, they frequently find integrating new technology difficult.

Table 1 Summary of cases and participants.

No. of cases	Learning strategy			Spaces	
	Subject area	Instruction/learning activity	Technology	No. of online participants	No. of offline participants
1	Multiple courses	- Group projects/group discussions, peering with online and offline students - Inquiry-based learning	- CLASSIN - WeChat - The camera captures the image of the teacher in class - Teach on iPad - Courseware displays - Editing tools - Teaching tools to empower engaging learning - Customize blackboard layout - Collaborative interactive whiteboard - Teaching assistant Software	50	25
2	English communication skills	- Collaborative activities - Group discussion - Face to face communication	- EDMODO - ZOOM APP - Touch large screen - PADLET - POWERPOINT - Multi-finger gestures - Screen switching - Small blackboard - Courseware displays - BREAKOUT classrooms - Video editing softwares - GOOGLE SHEETS	30	30
3	Mathematics	- Group discussion - Face to face	- VOOV MEETING - Camera - Interactive touch screen - Sound system - PADLET - GEOGEBRA - Learning Analytics - GRAMMARLY APP	100	70
4	Social studies	- Group discussion - Project-based learning	- ZOOM - GOOGLE MEET - JAMBOARD - PADLET - EDMODO - PREZI - Interactive screens - Digital cameras - Breakup rooms - Sound system - Video recordings - GOOGLE FORM - GOOGLE DOC	25	20

What are the functions of technology in OMO learning?

After analyzing the four case studies, it was found that multiple technologies were used and incorporated in the OMO learning environment. For instance, online and offline students used desktop computers, laptops, and smart phones as basic technologies to learn in an OMO environment. Internet was available to ensure connectivity between online and offline students. Functions of technologies were categorized with the lens of the SAMR Model (Aldosemani, 2019). SAMR is designed to analyze how ed-tech is used in a classroom. SAMR is divided into two domains, and each domain has two levels.

The SAMR model was introduced by Puentedura (2014). SAMR stands for Substitution, Augmentation, Modification, and Redefinition. In the first two levels, technology is used to enhance a task and in the second two, technology is used to transform the task. Much like the TIM, it is not assumed that teachers are going to work their way up to the “highest level” and then teach at that level consistently forever. Rather, it is understood that there’s an appropriate place for lessons at every level. With the Technology

Integration Matrix (TIM), we emphasize that entry or adoption levels are often appropriate when introducing a new unit or technology before lessons are conducted at the higher levels. The same concept holds in the SAMR model where “SAMR ladders” are constructed to increase the level of tasks throughout a series of lessons.

1. *Substitution*: In OMO learning, the different functions of technologies were used as a substitute to the traditional ones to facilitate the teaching and learning processes. For instance, in the collected case studies the teachers have used Classin, Zoom, WeChat and Google Meet for online communication as a substitute to the face-to-face interaction in the classroom. The opportunity to share screens became a common substitute for the whiteboard/blackboard. The Microsoft Word documents were used instead of filling out a worksheet with pen/pencil. In the second case, the teacher mentioned that he used electronic or web-based versions of the documents instead of using hard copies. He also used presentation software (like PowerPoint or Prezi) to construct a presentation providing information about the topic. In the third and fourth studies, the digital versions of the books (E-books) were provided to the students. In the first case study, the teacher mentioned that she asked her students to read online articles and then discuss the findings via WeChat and WhatsApp. As mentioned in Table 1, the teacher in the first case study used Google form and in the second case study used LMS embedded quiz for quiz assignments. Interactive screens were used as a substitute to the white/blackboard for online learners and breakout rooms in Classin were used for group assignments and discussion.
2. *Augmentation*: Augmentation is when technology acts as a direct tool substitute that adds functional improvement to the activity. For example, in the first and third case studies, students received help from Grammarly application and Google translator to write the assignments. As mentioned in the third and fourth case studies, teachers provided web links for YouTube video tutorials to learn different concepts. Courseware was also used to provide web-based content. The Jam board was incorporated in the teaching processes to teach mathematics and drawing concepts.
3. *Modification*: Technology is used to design interactive and dynamic tasks that go beyond the limitations of a traditional classroom. For example, in the fourth case study, students used shared documents using Google doc for collaborative work in large groups, allowing for seamless collaboration and knowledge sharing. In the first case study, a collaborative interactive whiteboard was used where students can save and re-edit multiple pages of documents. In the first case study, editing tools in the CLASSES classroom helped the teacher to mark the key points for further improvement. In the second case study, teachers mentioned that they used EDOMO to share a post and get students feedback to improve the quality of documents. Some teachers used a video editing software to create video content by incorporating photos, images, text, and audio, as a group project. Teachers also used Google sheets and directed students to online examples and supplementary learning materials for areas that they might struggle with.
4. *Redefinition*: Technology allows for the new form of previously impossible activities. For example, in the third case study, students were asked to make a documentary video answering a key question about various core ideas.

How OMO learning spaces are designed?

A sound architecture that caters to hybrid teaching and learning based on open instructional standards and tools is one of the main aspects of OMO learning. Therefore, to facilitate online activities such as video lectures and forums, secure networks and digital devices are needed. However, ergonomic classroom furniture is critical for offline students. After analyzing the four case studies we found that the learning spaces were extended by facilitating both offline and online students at the same time. The social distancing and safety measures were kept in view.

The main physical classrooms used by the offline students were equipped with both technology and ergonomic classroom furniture. Availability of classroom furniture, such as movable chairs and tables, was consistent everywhere. However, the technology varies in every classroom. For instance, the offline students came with their own laptop/mobile phones (having required software and application) by following BYOD (Bring your own devices) policy and some of the teachers used smart computer labs equipped with digital interactive screens, desktop computers installed with basic required software and applications, cameras, sound systems. Students in the remote/offline mode were equipped with laptop/mobile phone/desktop computers and internet connectivity.

For clear voice communication, microphones were often used to ensure that those in remote/online learning settings could hear their offline classmates, even though they were dispersed around the classroom for social distancing purposes. Similarly, external cameras were used to assist in-class students in sharing their work with remote/online peers without the need to pass around a laptop/desktop or cell phone. The customize blackboard layout e.g., camera/courseware/blackboard writing were combined and placed freely.

For presentation, sharing, and editing, Microsoft PowerPoint, Prezi, and Microsoft Word were used to present and edit digital content. Cloud drives like Google Drive was used to share digital content. Learning management systems like Blackboard, Moodle, and Edmodo peering with WhatsApp were also used to transfer web links, videos, documents, and recorded information. Some of the teachers used online coursewares for data sharing and presentation. After opening the courseware, the teacher can maximize, minimize or adjust the size of the courseware window. Additionally, some of the teachers used YouTube tutorials to deliver video content and video editing e.g., online Video editing tools.

For group discussion and collaborative activities, the Chat Rooms in ZOOM and GOOGLE MEET and the CLASSIN were used where online and offline students can work collaboratively on the same project/Activity. Teaching tools integrated into the CLASSIN e.g., SELECTOR, TIMER, DICE, SMALL BLACKBOARD were used to boost learning engagement. The Collaborative interactive whiteboard e.g., JAM BOARD and PADLET were incorporated for online group discussion, collaboration, and recording key points.

Discussion

The OMO learning mode was addressed in this study to meet the needs of students and teachers in the post-COVID-19 era internationally. This research analyzed the collected cross-case studies to design an OMO learning infrastructure to facilitate teaching and learning in the future. Specifically, this study discussed OMO learning from three perspectives, namely: learning strategies, functions of technology and space design requirements. Fig. 4 summarizes the obtained results.

In OMO Learning, technology is one of the important components that plays a crucial role to connect and facilitate both online and offline students at the same time. To effectively utilize the resources and constantly tailor material to fit functionality, users must grasp the essential capabilities of different technologies and devices integrated with OMO or e-learning software (McKenney and Reeves, 2016). For instance, the teachers should be aware of what type of technology will best complement their instruction. Functionality refers to the capabilities contained in a device or program that enable it to achieve its job (Gros, 2016). The display capability, audio and video capabilities, multi-language capability, video conferencing, online interaction, and the quality of the operating platform are all examples of functionality. It must be kept in mind that using or integrating technology and instruction in the OMO environment is different as compared to traditional/physical, online, or blended learning environments.

Based on the collected case studies, we found that substitute technologies used in OMO learning environments can facilitate teachers and learners in their learning processes. First at the substitution level, according to Puentedura (2014), teachers are largely performing the same things they were doing in their classrooms before the digital integration. Just the usage of technology may not have a substantial influence on learning outcomes at this stage (Puentedura, 2014). Puentedura (2014) used substitute technology to complete work more efficiently and effectively. Making slide shows, producing papers, conducting research, evaluating data, and communicating with others are all examples of this. Microsoft Word application has been introduced as a substitute for handwritten work. The unique opportunity to share screens between online and offline students has also become a common substitute for the whiteboard/blackboard in the OMO environment. The substitute technologies used in OMO learning have the potential to make learning processes more convenient and efficient in an emergency just like a pandemic.

Some technologies enhanced the learning activity and transformed it. For instance, the use of video conferencing tools combining with cameras to monitor teacher's movement and sound system enabled the entire classroom to be connected with online students for collaboration and interaction. Having learning in an OMO environment was a new experience that was not possible in an online or even blended learning environment. The learning that takes place in these scenarios would not be possible without the ubiquitous integration of technology. Students' interactions with each other via linked networks to cooperate, explore, assess, and reflect on learning are examples of this type of learning.

This study also found that some technologies helped teachers for the functional improvement in the activities during online and offline classes. It helped teachers and students to make learning more authentic. It may also be beneficial to have both synchronous and asynchronous copies of the given lectures. If you're using a videoconferencing tool like Zoom or Skype to host class sessions, it is possible to make a recording for students who can't attend. You can also make educational videos that students can watch at their leisure.

Learning analytics has been used to monitor and track students learning behavior rather than teachers who work hard to keep a record of students' behaviors and their progress. For instance, learning analytics helped a scholar from Northeastern University to realize students' learning habits in online classrooms during the pandemic (James, 2021). This is one of the key distinguishing

Fig. 4 OMO learning environment model.

features to make OMO teaching and learning processes easier and focus should be paid to incorporating learning analytics (LA) and building LA dashboards, however, its effectiveness needs to be explored further.

In the OMO learning model as shown in the substitution and augmentation phases, teachers will often use automation to complete typical assignments. Teachers modify the assignments and the tasks extend into the confines of the classroom at the next two stages (modification and redefinition). However, not all tasks must be at the redefinition phase. Romrell et al. (2014) looked at tasks in various levels of the SAMR. They discovered that every task, for instance, at the redefinition level was “personalized situated and linked,” but not the tasks at the lower level of the SAMR model (Romrell et al., 2014). They conclude that customized, location-based, and related experiences can rethink and change learning (Romrell et al., 2014).

However, lack of adequate training regarding technology integration in OMO learning was one of the key findings related to the challenges reported by teachers. These findings are also aligned with a pilot study conducted by the authors, where they suggested that OMO learning requires teachers to develop different digital teaching competencies, including operating online platforms, communicating with online and offline participants, and utilizing resources. To realize effective technology integration in OMO learning, school administrators should seek assistance to identify and provide ongoing trainings. Furthermore, using the guidelines offered by ISTE (2021), schools/universities should define professional development services for OMO teaching and learning that better meet their needs. The second major issue reported by teachers was data protection and privacy in the OMO learning environment. The subject of student data privacy has never been more relevant, important, and stress-inducing for school administrators (Huang et al., 2020). While the privacy has been discussed since the 1970s, when schools started gathering electronic data, nothing has changed since the days of analog technology and cassette tapes.

In OMO learning, technologies are likely to have a more central role because they permit active student learning activities in which the teacher serves as a facilitator of the learning process. This study found that OMO learning uses various tools and platforms that allow a collaborative learning environment that makes teaching practices more flexible, engaging, and open. Huang et al. (2021) found that pedagogies in OMO learning are more open and flexible. Additionally, OMO learning also encourages active learning even in times of crises and emergencies. In this context, Huang et al. (2021) point out that open educational practices are an effective and innovative way to enable and maintain education from home during times of crisis and difficult situations.

As previously stated, the OMO modality effectively integrates or enhances learning with the right mix of technology and instruction to allow rich real-time engagement, teamwork, and connectivity between teachers and students (Toor, 2021). The OMO approach involves transparent and flexible teaching and learning activities, allowing students and teachers to engage more diversely. As a result, students will study at their own pace, for example, by reconsidering previously published lessons under an open license. Teachers must undergo a paradigm change from the teacher-centered classroom to the student-centered classroom to make efficient use of computer-based devices (Benlahcene et al., 2020; Ellis and Bliuc, 2019; Gu, 2021; Morel, 2021; Wong, 2021). The increasing adoption of constructivist learning theories, along with intelligent learning innovations provide new possibilities to solve individual discrepancies of the pupil, one of the emphases of contemporary educational instruction.

Conclusion and implications

The four OMO learning cases investigated in this study underlined the significance of planning for active learning, selecting technology-based on representational and communication needs, preparing spaces and teachers for OMO learning. The rich-media content, students and teachers interaction from different locations, open and collaborative technologies will become so invisible and common that students and teachers communicating from different places will feel as if they are in the same room. Meanwhile, current technologies continue to pose substantial obstacles in OMO settings, necessitating teachers to carefully consider their designs and use instructional techniques and workarounds to enhance learning, community development, and the student experience.

In addition, it would also be useful to look at ways to improve the level of engagement among online and offline students. During the teaching process, several online students were bored and walked away from their computers. Furthermore, it is essential to analyze ways to track students involvement and engagement, as their presence in video lectures does not imply sometimes that they are following the learning process.

Despite the solid findings about OMO learning environments in the post-COVID-19 era, it is important to acknowledge that this study contains several limitations. For example, this study analyzed a limited number of case studies (only 4 case studies) and it was mainly based on qualitative analysis. As a result, the findings cannot be generalized, and further quantitative analysis with more case studies should be carried out in the future to make more detailed insights regarding the design of Online-Merge-Offline (OMO) learning environments.

The purpose of this entry is to explore the topic of assessing student learning outcomes. I first start by offering a definition of what I mean by assessment and student learning outcomes. Then, I discuss who has responsibility for student learning, key characteristics of student learning outcome statements, the benefits of using student learning outcomes, and steps for assessing student learning outcomes. I also include two examples of student learning outcome assessment efforts.

Assessment and student learning

Assessment has become a ubiquitous concept in higher education but often gets caught in a tangled web of terms, particularly with definitions of research and evaluation. Although one can easily be concerned with the nuances of each of these terms and definitions, for clarity and for the purpose of this entry, I define assessment as the process of collecting, analyzing, and interpreting information to improve effective change for students.

Similarly, the definition of student learning outcomes is also likely to vary among the authors who write about them. However, for the purposes of this entry, I define them as outcomes to explain, demonstrate, or understand what students are expected to learn and what they are expected to be able to do, as a result of attending and participating in a class, experience, or opportunity at a higher education institution (HEIs). If student learning is truly a desirable outcome for HEIs, then it must be assessed as such and not seen as a by-product for students enrolled in the systems of postsecondary or tertiary education. Although student learning outcomes should be developed and assessed for the multifaceted experiences and opportunities that exist at universities, this entry specifically focuses on those experiences that occur in the cocurriculum (i.e., the part of the college experience where students are involved in out-of-class activities, often referred to as clubs, organizations, and societies). Taken together, assessing student learning outcomes then is the intentional process of collecting, analyzing, and interpreting what students are expected to learn and what they are expected to be able to do to enhance their learning as a result of their involvement in cocurricular experiences.

Shared responsibility for student learning

Increased demands by the public, legislators, parents, and students, among others, for greater accountability and continuous improvement in HEIs have permeated all sectors of higher education regardless of stature, location, or global ranking. Central to these demands is the rising costs of attending higher education; escalating student loan debt; and as more graduates are unemployed or underemployed, concerns about the ability to translate what students learn to what employers need and want from employees. Increased attention on institutional assessment efforts to address these issues and demonstrate return on investment are met with mixed results. More specifically, assessment is inextricably tied to the accreditation or accountability process, which creates issues for establishing a culture of institutional assessment because of the continued start and stop nature of these processes. For example, when student learning assessment efforts focus primarily on the accreditation process, once it is finished, the desire to assess is likely to subside until the next accreditation cycle when the assessment process starts all over again. Similarly, when accountability is the purpose for assessment efforts, student learning is not the focus, but rather the focus becomes the return on investment or what graduates earn. Unfortunately, when the philosophy for conducting assessment of student learning is primarily focused on accreditation and accountability processes, then the learning students derive from their curricular and co-curricular experiences becomes

ancillary. Although many Institutional leaders engage in assessment for accreditation and accountability, others pursue assessment efforts better to understand the growth and learning of students. I argue assessing student learning outcomes does not need to be an either/or dilemma, but rather a both/and opportunity, and assessing student learning needs to occur in both the academic and cocurriculum.

One could reasonably argue assessing student learning outcome efforts has gone beyond accreditation and accountability measures to include how students spend their time and what they gain from attending college (Kuh, 1993). Yet, much of this focus is on more cognitive dimensions of learning from the college experience that is tied to the academic curriculum. Indeed, over the last 20 years, assessing student learning in the academic curriculum (e.g., assessing what students should learn and be able to do as a result of attending a class or completing coursework) has received greater attention in Western and International contexts using adapted versions of the National Survey of Student Engagement (NSSE, 2021), that is, the South African Survey of Student Engagement (SASSE) (Strydom and Mentz, 2010); Australian Survey of Student Engagement (AUSSE) (Coates, 2010); and the Chinese College Student Survey (CCSS) (Shi et al., 2014). Indeed, measuring academic learning outcomes have become increasingly important in international higher education (Coates, 2016) because of the quest for greater recognition often associated with climbing the global ranking ladder.

Despite these assessment initiatives, their primary focus remains on the academic curriculum, without much attention given to other aspects of the college experience, particularly in the cocurriculum. Moreover, cocurricular assessment activities, unfortunately, are often not well integrated with other campus assessment activities—in part, because academic affairs still conduct much of the work on student learning outcomes. This, then, leads other parts of the college experience unassessed. When only one part of the college experience is explored it fails to take into account the overall contributions of the many facets of involvement and limits the extent to which strategies for improving student learning and success can be implemented.

Cocurricular assessment efforts are often referred to as a missing element in the day-to-day work of those who work with cocurricular programs and services. However, when professionals whose primary responsibility for the growth and development of college student experiences outside of the classroom engage in assessment strategies, their assessment efforts are spent more on student satisfaction. Putting more assessment effort into student satisfaction usually equates to far less time assessing what students are learning from the many programs, workshops, seminars, and events offered under their purview. Moreover, since cocurricular experiences help us to understand the contributions they make to student learning, additional efforts are needed that focus on the cocurriculum as this voice is too often absent from campus-wide discussions on assessment of student learning.

Creating student learning outcomes

Creating student learning outcomes is a systematic process accomplished through essential steps requiring educators to identify and articulate specific learning goals students achieve through participation in learning experiences and opportunities. To be most effective, student learning outcomes must be clearly communicated such that they identify a target audience (i.e., who should be assessed), the type of learning behavior to result from the experience (e.g., what should be learned), the learning statement that identifies the expected condition or action (e.g., how should the learning occur), and the degree to when the learning might occur (e.g., when will the learning occur). Since the focus of this entry is student learning outcomes for students in postsecondary or tertiary education, students then are the target audience or the subject of the learning outcome.

In the next step, educators must be careful to identify specified learning behaviors or action(s) that are observable for the students involved in the experiences and opportunities and not on what the program intends to offer. Making student learning outcomes observable is the foundation in this step and is accomplished by using operational and action verbs as a core element in the learning outcome. Moreover, a key component of clearly communicating the student learning outcome then, is choosing the correct verb, as the verb is the fulcrum of the student learning outcome, meaning that it balances the audience and the learning statement.

The use of action verbs derives from the hierarchical taxonomy of complex processes advanced by educational psychologist Benjamin Bloom and his colleagues. Bloom's taxonomy has 6 meta categories of educational objectives: knowledge, comprehension, application, synthesis, and evaluation (Bloom et al., 1956). Each meta category in turn has a number of action verbs to represent elements of cognitive development. Higher cognitive levels of understanding incorporate and build upon elements of lower levels of cognitive learning. Bloom's taxonomy (Bloom et al., 1956) and revised taxonomy (Krathwohl, 2002) are valuable resources as they offer useful language to be included in student learning outcome statements. In fact, the *Council for the Advancement of Standards* (CAS) (Council for the Advancement of Standards in Higher Education, 2019), *Learning Reconsidered* (Keeling, 2004), and *Learning Reconsidered 2* (Keeling, 2006) are but a few examples of how Bloom's taxonomy is integrated into frameworks that guide student learning outcome development. Moreover, since Bloom's taxonomy is one of the oldest and advanced, it has received the greatest attention and support in the literature as being illustrative and useful in providing an established sequential model of learning actions. Incorporated into each meta category of the model is a list of action verbs for writing learning outcomes such as cite, compile, create, design, identify, plan, select, utilize, demonstrate, prepare, use, compute, discuss, explain, assess, compare, critique, outline, and evaluate that characterize the ability to demonstrate cognitive thought processes. For example, as a way of

students demonstrating development in the knowledge category of the taxonomy, the lowest level of complexity, students can cite key facts and concepts, but in the highest level, they need to engage in interpretation by assessing the quality of information and provide evidence to support their claims.

Another valuable resource to utilize when identifying observable student learning outcomes is a departure from the traditional action verbs found in Bloom's meta-categories. This more nontraditional perspective is advanced by Adelman (2015), who advocates for the inclusion of Natural Language Processing (NLP) (Levin, 1993) to guide 20 categories of operational verbs. Although the methodologies and categories of NLP are beyond the scope of this entry, Adelman's argument for the deviation from the traditional action verb language is important to consider because of the value of language and syntax in creating student learning outcomes, particularly in international contexts. Adelman contends that many of the action verbs found in Bloom's meta-categories lack measurability, whereas, an operational verb references "student actions that are directly observed in external contexts and subject to judgment" (p. 7). Moreover, Adelman argues for the exclusion of the verb "able" and the noun "ability" in developing student learning outcomes and groups the categories of operational verbs by their governing functions (e.g., modes of communication, ways students process data, ways students certify gathered information). Among the 20 categories are verbs like access, collect, retrieve, obtain, frame, classify, describe, define, estimate, assemble, illustrate, identify, specify, organize, compare, gather, examine, construct, argue, defend, adapt, and negotiate.

Although readers will quickly identify some overlap between action and operational verbs, I encourage readers to review the work advanced by Bloom and Adelman and then consider both the advantages and disadvantages to using either body of work. The ability to actually observe and measure student's actions must be taken into account to assess student learning outcomes. The emphasis I offer in discussions about Bloom and Adelman is that equally important to using verbs that describe exactly what the learners will be able to do is avoiding verbs that lack clarity in the context of student learning outcomes (e.g., learn, appreciate, understand) because they lack observability, which then affects their ability to be measured. Regardless of the body of work one chooses, this step in the process, allows educators to identify strategies to assess and measure the degree to which student's actions are observable by being able to describe, demonstrate, perform, analyze, or generate the desired knowledge or skill as a result of the experience and opportunity.

When student learning outcome statements incorporate these characteristics, they can then be measured and assessed to determine growth and development. For example, a sample learning outcome statement could be, "As a result of students attending this career workshop, they will identify key elements of an interview." In this example, students are the intended audience, and the observable behavior and outcome is identifying key elements of an interview; the how is that they will learn how to identify, and when is attending the career workshop.

Furthermore, when these steps are used as a guiding framework, then assessment becomes an integral component of creating the student learning outcomes process. Furthermore, this process is most effective when educators take time to reflect on the essence of the experience and opportunity they offer to students and then describe what students will achieve as a result of their involvement. Student learning outcomes should also be connected to a larger set of desired outcomes or competencies such as those in the mission of a department or institution or in professional fields. Although assessment of student learning outcomes can be a formalized process overseen by an institutional assessment office, which is often the case with accreditation, it does not need to be so. In fact, I argue assessment must be integrated in all components of the college experience where there is potential for student learning to occur. I encourage institutions to engage in a process of mapping their learning environments where educators identify curricular and cocurricular experiences and opportunities that are likely to lead to desired student learning outcomes. Mapping the variety of these occurrences then provides opportunities for anyone with responsibility for student learning to engage in creating specific outcomes for those experiences.

Benefits of assessing student learning outcomes

When there is a thoughtful and intentional institution-wide approach taken to creating and implementing student learning outcomes, benefits to assessing them can be realized: six of which are noted here. First, when assessment of student learning extends to all aspects of the student experience, there is greater potential to identify learning areas where students gain the most, and least, from their college experiences. Because students are far less likely to create a bifurcated system for their college experience, even though such separation is often created in HEIs by those who see their primary responsibility as either in the academic curriculum or the cocurriculum, being able to identify learning outcome areas can lead to campus-wide discussions and efforts to develop strategies to improve deficient areas of student growth and development. Similarly, knowing where learning is taking place also provides the opportunity for greater synergy and connections to help students have a seamless experience between what they are learning and doing in the classroom to what they are learning and doing in cocurricular experiences.

Second, assessing students on the intended learning outcomes for the various types of experiences they participate in conveys a message on the role and importance that learning plays in those experiences. Then, students can use this assessment information to better understand their role and responsibility in identifying the learning they desire to gain from their experiences. Students should be encouraged to develop an action plan that takes into account knowledge they have gained and knowledge they still hope to gain while in college. So, when students are more aware of what they should learn and do learn, they can be active participants in their own goal setting by seeking out those experiences that are likely to lead to greater success. Similarly, sharing student

learning outcome assessment results with students and encouraging them to reflect on their learning helps them to share responsibility for their learning. When students know what they gain from their college experiences, they may be more likely to invest the time and energy in other activities where they identify what they will learn.

Third, assessing student learning outcomes affords greater opportunity to showcase how student learning outcomes are being fulfilled by a department, division, or institution's mission. Knowing if students gain intended learning outcomes provides opportunities for departments or offices to showcase how the programs and events they offer align with the institution's mission or that they need to reconsider their offerings to create better alignment. When HEI budgets become considerably tighter and constrained, being able to show how student learning from various programs contributes to the overall institutional mission is essential particularly when there are implications for potential resource allocation.

Fourth, assessing student learning helps those designing curricula and programs the opportunity to determine whether the intended outcomes from the experiences are being reported by the students who participate in them. Additionally, assessing helps determine if the intended learning outcomes of the programs and services they implement are having the types of intended influence for students.

Fifth, assessing student learning outcomes and analyzing results allows for going beyond hunches and anecdotal evidence. Assessment is an effective way to become experts on student learning. When those responsible for student learning believe they share the responsibility of knowing and supporting students personally and holistically to persist and be successful in college (Sedlacek, 2004), assessment efforts will more likely be integrated by multiple people and not only an institution's accreditation office.

Finally, if student learning is a shared responsibility by campus stakeholders, then assessing student learning outcomes provides the opportunity to see how experiences and learning opportunities are connected so students can be encouraged to reflect on their experiences. When students are encouraged to reflect and make connections and meaning, their learning becomes transformative and applied experiences (Wawrzynski and Lemon, 2019), which allows them to also see how their gained knowledge might be applied in other settings and experiences.

Steps in assessing student learning outcomes

The intrinsic value of engaging in assessment to understand what and if students are learning can no longer be taken for granted in systems of higher education. Indeed, many who are responsible for student learning contend they lack the time and the knowledge base to engage and conduct assessment efforts. However, when the steps presented earlier in this entry are used as a guiding framework to create student learning outcomes, assessment challenges and barriers are more likely to be overcome. I offer the following eight steps as a process for assessing student learning outcomes. A key assumption when developing these steps is that the purpose of engaging in assessing student learning outcomes is an intentional effort to collect, analyze, and interpret what students are expected to learn and what they are able to do as a result of their involvement in an experience. Remember, the specific focus I make is on involvement in cocurricular experiences (Table 1).

Table 1 Steps to assessing student learning outcomes.

1. **Determine what experience you want to assess.**
 - Are you assessing student learning outcomes from a specific experience?
2. **Determine the purpose for the assessment.**
 - What goals are you attempting to achieve?
 - What will you do with the data once it is collected?
3. **Determine what students should know and be able to do as a result of the experience.**
 - What do you want students to know as a result of participation in an experience, class, workshop, etc?
4. **Develop observable learning outcomes using action and operational verbs.**
 - Develop measurable student learning outcomes.
5. **Determine the appropriate assessment method.**
 - Are qualitative or quantitative strategies most appropriate for what you want to know?
 - How will you collect the data? Will you use focus groups, individual interviews, surveys (online or paper and pencil)?
 - Are there pre-existing instruments to use to accomplish your assessment goals?
 - Who should collect the data? Do those collecting data have experience and knowledge to do so?
6. **Determine how you will analyze and interpret the data.**
 - Is there someone who has experience and knowledge analyzing data given your chosen collection method?
 - How do you reduce bias in your interpretation? Is there a colleague who can provide feedback about the interpretation process?
7. **Generate implications for policy and practice.**
 - What did you learn from the study?
 - What changes can you suggest from what you learned?
8. **Develop a plan to report results.**
 - Which stakeholders do you need to share information with?
 - Who is likely to benefit from your results and what format is best to disseminate findings and implications?
 - Be sure to share results with participants who provided data for your assessment.

Note. Each step represents important considerations when preparing to engage in assessment.

Examples

I offer a brief overview of two assessment projects to demonstrate ways to engage in assessing student learning outcomes. Both projects started with a review of the larger extant literature associated with the general thematic nature of the project to gain a better understanding of what is known about the topic. From that initial review of the literature, both a qualitative and quantitative study were developed as part of each study's overall attempt to gather data and assess student learning outcomes. Although the first study is a larger multi-institutional study, the process is very similar to conducting assessment of student learning at a single institution.

National Peer Educator Study

The National Peer Educator Study is an ongoing study first started in 2004 with support from the BACCHUS Peer Education Network; now, the Health, Wellness, and Safety Initiatives of the National Association of Student Personnel Administrators; using both qualitative and quantitative assessment strategies (Wawrzynski et al., 2011). The purpose of this project is to examine learning outcomes of students who participated in specific types of leadership roles (i.e., peer educators).

University administrators value the pivotal role peers play in a student's growth and development while in college, and, as a result, utilize students selected to serve as peer educators in a number of cocurricular experiences. Students in these roles are called upon to mentor and facilitate dialog that encourage peers to consider, talk honestly about, and develop healthy lifestyle choices. Because of their ability to communicate with their peers about sensitive issues, the result has been an exponential growth of peer education programs. The strength of the peer influence has several benefits on the outcomes of student learning, attitudes, and behaviors, which explains why peer education programs have experienced growth across many higher education sectors. However, despite substantial use of students as peer educators to positively influence and enhance the undergraduate student growth and development of their peers, little knowledge existed, beyond anecdotal evidence, about what benefits or learning outcomes peer educators derive, if any at all, from their experiences in these roles. Recognizing this gap in the literature, the National Peer Educator Study was launched.

The first stage of the National Peer Educator Study consisted of a review of the literature to guide the development of a qualitative assessment protocol developed for use in focus group interviews. Over 100 undergraduate peer educators attending a national peer education conference participated in one of a dozen focus groups to share their personal learning and outcomes attributable to their peer education involvement (Wawrzynski et al., 2004). Themes constructed from these data, among others, included peer educators' gains in intrapersonal development (e.g., value clarification and self-confidence) and practical competence (e.g., public speaking and presentation skills) (Wawrzynski and Cox, 2005).

In the project's second stage, the focus group data helped inform the development of the *National Peer Education Survey (NPES)*, which is used to gather data and advance the evidence-based research on the learning outcomes peer educators report as a result of their experiences (see Wawrzynski et al., 2011 for more information about the study and survey). The NPES was developed through a multi-step process starting with a review of the literature by college health officials and those directing the project. This review specifically included identifying desired outcomes for college peer educators and student outcomes noted in the literature that correspond to the seven learning domains in *Learning Reconsidered* (National Association of Student Personnel Administrators [NASPA] and American College Personnel Association [ACPA], Keeling, 2004). In the first iteration of the NPES, Bloom's Taxonomy (1956) was also utilized because it offered language consistent with student learning outcomes identified in the literature and desired peer educator outcomes of interest. *Learning Reconsidered* served as a conceptual framework for the study because it provided language for the development of student learning outcomes, as its domains aligned with student learning outcomes, we were interested in observing. Specifically, we explored six learning domains:

- Cognitive complexity (develop solutions, analyze situations, apply prior experiences)
- Practical competence (effectively present programs, sense of purpose, provide feedback)
- Intrapersonal competence (recognize strengths/weaknesses, clarifying values and beliefs)
- Interpersonal competence (effectively work with others, manage conflicts, lead a group)
- Knowledge acquisition, construction, integration and application (re-evaluate previous assumptions, listen to and consider others' viewpoints, formulating approaches and solutions)
- Humanitarianism and civic engagement (have conversations with students different from oneself, responsible for helping to improve campus community)

Although the NPES has received slight modifications over the years, most notably with the release of *Learning Reconsidered 2* (Keeling, 2006) and substantive revisions in the *Council for the Advancement of Standards [CAS]* Professional Standards for Higher Education (CAS, 2019) it has remained a relatively valid and reliable instrument that certainly advances our understanding of gains peer educators derive from their experiences. In fact, since its debut, peer educators at over 400 institutions have participated in the administration of the NPES of which over 70 institutions do so annually. Institutions who participate in the study receive an institution specific report of the results, which allows them to assess the learning of peer educators in their programs. Although the

National Peer Educator Study specifically focuses on college peer educators who work with health and wellness initiatives, the learning outcomes are easily applicable to peer educators in other campus services and initiatives (e.g., resident assistants, peer tutors, orientation assistants).

Nelson Mandela University Student Learning Outcomes Initiative

The second assessment project, the Nelson Mandela University Student Learning Outcomes Initiative, is more than a decade old and part of a larger institution-wide student learning outcomes assessment effort undertaken at Nelson Mandela University (NMU), in Port Elizabeth, South Africa. The motivation for the development of this project was two-fold. First, the project explores larger aspects of how students engage in and benefit from the college experience in the re-structured, post-apartheid higher education system in South Africa (Wawrzynski et al., 2012). More specifically, particular attention in this project is on the efforts to understand the influence and contributions of cocurricular involvement to student learning, since a majority of a student's time is spent outside the classroom. Indeed, assessing student learning outcomes from other parts of the collegiate experience is now more important than ever, as high unemployment rates in South Africa, acerbated by the lack of traditional academic ways (e.g., internships) students gain skills that employers seek (e.g., collaborating with other members of a group, comparing and contrasting different points of view, and evaluating other points of view to come to a workable solution) presents unique opportunities to assess other experiences where students do gain them.

The second component of the project dovetailed the first aspect of the project to assess student learning outcomes from cocurricular involvement through the development of institutional learning outcomes and indicators. In order to gain support across campus, various campus stakeholders (e.g., students, faculty, student affairs staff) with an interest in student success were recruited to be part of the University Cocurricular Forum Committee (UCFC). Through a consultative process, the UCFC was tasked with developing a set of institutional student learning outcomes specific to cocurricular experiences. Members reviewed both national and international literature including culturally relevant literature (e.g., noncognitive variables, student learning domains from the Council for the Advancement of Standards in Higher Education (CAS, 2009), and CAS's Frameworks for Assessing Learning and Development Outcomes (Strayhorn, 2006) to adapt and create a set of 15 institutional learning outcomes with 66 developmental indicators for students participating in NMU cocurricular activities.

These institutional student learning outcomes and developmental indicators were then used as a conceptual framework to guide the creation of a cocurricular transcript and qualitative and quantitative assessment strategies. Using this framework, one quantitative assessment included the design of, and data collection with, the Student Life Survey (SLS). The Student Life Survey was developed through an iterative process with the UCFC, which was also consistent with survey design strategies (see Wawrzynski et al., 2012). For example, using the 66 developmental indicators, the SLS is a 39-item questionnaire and asks questions like, "Student life activities I participate in at NMU help me acquire skills that I can use after leaving the University." Additionally, since the SLS is administered anonymously, students are asked to provide demographic information, their participation in officially recognized societies and clubs, and other questions that measure sense of belonging and tied to student success.

The SLS is administered to NMU students as part of an annual data collection process assessing cocurricular learning. Students are solicited to participate in the SLS in one of two ways: (a) an email invitation is sent to students, and (b) student volunteers are recruited to canvas strategic locations across campus (e.g., taxi stops, public transportation areas, library, and residence dining halls) asking students to complete the online SLS using a tablet computer. These two assessment strategies were employed because many students do not have access to computers once they leave the university for the day. Although the SLS has received slight modifications over the years, it has shown to have excellent psychometrics.

Data analysis identified learning outcomes associated with collaboration, facilitating group discussions, cooperating with others to achieve a common purpose, appreciating human and cultural differences, seeking involvement with people who hold different points of view, understanding values and ethics, commitment to personal morals, greater self-awareness, and pursuing individual goals as a result of their involvement in cocurricular experiences. These results are disseminated to campus stakeholders so they can identify the areas of greatest and smallest reported growth for students who participate in various types of cocurricular experiences. Additionally, analysis results help guide larger institutional conversations on the value of student learning outcomes from cocurricular involvement.

Concluding thoughts

Certainly, there are benefits to developing thoughtful and intentional efforts to assess what students are learning from their college experience. Moreover, given the current climate of accountability, being able to provide empirical data that can highlight the contributions of cocurricular programs and events to students' growth and development has gained interest in higher education institutions globally. Collecting these data must start with developing observable and measurable student learning outcomes, which then can be coupled with effective assessment strategies to more adequately identify the learning students gain from college experiences.

Performance assessments in higher education

The Internet as an information and learning environment in higher education

In the era of digitalization and globalization, society, and higher education in particular, is faced with the challenge of how to deal with a new, rapidly changing information and learning environment. The Internet presents a flood of complex, potentially conflicting and competing information of highly diverse quality and from media sources of varying credibility. New information and communication technologies (ICTs) provide countless benefits and opportunities for higher education and research, particularly with regard to new forms of knowledge generation, accumulation, and dissemination through (new) digital media. Established systems for knowledge generation, including education, research, and traditional media, have been complemented by new, predominantly web-based media and dissemination channels. The latter are emerging at an ever-increasing rate, while the quality and sources of information are becoming harder to track and monitor (Brooks, 2016; Rott and Garvin, 2015). Erroneous information, deliberately misleading information, and breaches of privacy are problems in and of themselves (Ciampaglia, 2018). Recent studies indicate both positive and negative effects of the use of digital media on student learning. For instance, these can include student information overload, when they cannot handle diverse knowledge sources of varying quality (Hahnel et al., 2019) and/or are unable to process and efficiently organize the information provided (for current meta-studies, see Molerov et al., 2020; Zlatkin-Troitschanskaia et al., 2021).

Today, the Internet is among the most widely used sources for information. Students increasingly learn with the help of Internet-based sources, including mass and social media, even more frequently than via traditional sources for learning, like textbooks (Brooks, 2016; Maurer et al., 2020). The online environment ostensibly presents unlimited and diverse information and sources of knowledge with highly diverse (e.g., domain-specific, sociocultural) attitudes and values. Not least during the COVID-19 pandemic it became evident, that there are various ways in which “information” can be understood. For instance, personal values significantly shape the way in which students access and process information. Therefore, it is not enough to present students with what is considered adequate or appropriate information, if students then apply different values for processing this information. Evidentially, with low access barriers, deficient quality control in publishing, and easy dissemination, especially online mass and social media often contain incomplete or biased information (Nagel et al., 2020; Machete and Turpin, 2020) that can lead to the acquisition of false domain-specific and generic knowledge and/or misconceptions among students (Rott and Garvin, 2015; Shahibi and Rusli, 2017; Weber et al., 2018a).

Need for digital performance assessments in higher education

Most recently, the COVID-19 pandemic has led to an historically significant change in learning practices and educational assessment. Distance learning in universities is being expanded, thus demanding better implementation of ICTs as well as integrated digital assessments. However, substantial deficits in both students' digital learning and digital assessments in higher education were recently observed (Marks et al., 2021; Raaheim et al., 2019). Thereby, two connected but distinct current developments should be distinguished: First, steadily increasing formal (and informal) uses of digital media in formal learning settings. Second, the role of digital assessment technologies, which are increasingly used to capture and measure students' information processing and online learning but rarely used as (formative or summative) assessments in formal educational settings. Since the pandemic will further lead to substantial and permanent changes in the media and learning environments (although the scope and impact of these changes remain unknown), this represents both an opportunity and a challenge for formal learning and assessment in higher education, i.e., the integration of (digital) assessment and learning.

The valid measurement of student competencies and learning outcomes in higher education, which include key 21st century skills like critical online reasoning is becoming more important than ever. Today, the competent use of (online) information is key to the functioning of educational (and societal) systems. The demand to validly measure student learning and student learning outcomes in digital and non-digital settings in higher education has gained momentum worldwide. As illustrated by the largest international comparative study in higher education, the Assessment of Higher Education Learning Outcomes (AHELOs), there have been both advances and challenges in the development of valid and reliable assessments of student learning outcomes and, in particular, in the use of (digital) PAs in higher education. AHELO examined the feasibility of validly measuring student learning outcomes internationally, including performance assessments (PAs) for measuring generic skills (OECD, 2012, 2013).

To date, many types of assessments have been developed to measure student learning outcomes, which include self-report surveys of learning and multiple-choice and short-answer tests (Braun, 2019; Liu et al., 2016; Sendurur, 2018; Sparks et al., 2016). However, so far only few formats have been tailored specifically to reliably and validly measure key student learning outcomes like critical reasoning in online media use (Goldman and Brand-Gruwel, 2018). In light of the challenges that higher education is facing in the context of a flood of (digital) information, current research stresses how (digital) PAs can drive the introduction of 21st century skills and deeper learning principles into educational practice (Darling-Hammond and Adamson, 2014). Such practices can foster much-needed skills for learning in digital settings, as students learn to reliably and autonomously build knowledge, while navigating the ocean of online information (McGrew et al., 2018; Weber et al., 2018a).

To investigate how the competence set required for successful learning in digital and non-digital settings can be effectively promoted in higher education, the underlying skills must be measured using valid, authentic, digital PAs.

Assessment frameworks and formats for measuring student learning in higher education

There is a consensus in current educational research that complex cognitive higher-order procedural skills and multifaceted competencies like critical online reasoning can hardly be validly measured with traditional standardized tests. For instance, multiple-choice knowledge tests usually only assess declarative and conceptual/factual knowledge (Braun, 2019). Closed test formats generally do not assess the complex, multidimensional competence constructs and instead focus on students' skills and knowledge facets (e.g., pedagogical content knowledge) (Davey et al., 2015).

As recent research reports indicate (Liu et al., 2016; Molerov et al., 2020), there are many closed-format tests for assessing complex competencies like critical thinking. One of the main shortcomings of these tests is their limited authenticity and ecological/"face" validity. Moreover, these instruments demonstrate a strong correlation with tests for general cognitive skills like intelligence tests or the Scholastic Assessment Test (SAT, Suckow et al., 2015). Ultimately, they fail to measure more specific procedural/functional skills, for instance the competent use of (online) information required for successful learning in higher education and beyond (Shavelson et al., 2019; Davey et al., 2015; Sparks et al., 2016). For instance, the well-established assessments of critical thinking skills are based on standard-setting research (Braun, 2019) but usually use multiple-choice formats and brief situational contexts (Liu et al., 2014). They mainly assess generic cognitive and inferencing abilities. For example, the most well-known test is the Watson-Glaser Critical Thinking Appraisal (Watson and Glaser, 2002) that comprises tasks on inferences, recognition of assumptions, deduction, interpretation, and evaluation of arguments. It is questionable to what extent the tasks are ecologically valid and whether students can transfer the measured skills to real, more complex requirement situations.

At the other end of the assessment spectrum are traditional essay prompts with open responses. Their suitability for validly assessing complex student competencies like critical thinking is generally limited by challenges in objective and reliable scoring and the brevity/openness of the task prompt.

Compared to the established assessment approaches (for an overview, see e.g., (Liu et al., 2014), students' complex, multifaceted competencies can be more adequately measured through PAs that present realistic scenarios and tasks (Davey et al., 2015; Braun, 2019). A PA typically includes one or more tasks, at least one of which must be a performance task and other tasks may be included such as short answer (for details, see Sections **Conceptual-theoretical and methodological foundation of performance assessments** and **Performance assessment framework**).

Digital PAs are better suited to reflect current learning contexts, conditions, and requirements both in and outside of higher education (Shavelson et al., 2019; Davey et al., 2015; Oliveri and Mislevy, 2019). They allow for higher education students to interact with a simulated digital environment to perform complex tasks and demonstrate skills they would use in real life situations.

Computer-based performance assessments in higher education

So far, few projects and assessments focus on measuring higher education students' performance using real-world tasks. The CAE sponsored the Collegiate Learning Assessment (CLA) developed by Klein, Shavelson, and Benjamin (Shavelson, 2010), which was also used in the AHELO study, and has launched a refined performance test of critical thinking, the CLA+. The revision comprises shorter performance tasks with an open-ended response format and is complemented by 25 selected-response questions on separate item stems so as to produce individual student scores (Zahner and Ciolfi, 2018). The CLA+ is available internationally for various countries (Wolf et al., 2015). It has been used in the US and was also adapted and used in Italy, the UK and Finland (Zahner and Ciolfi, 2018; Kleemola et al., 2021). It has undergone preliminary validation in Germany (Zlatkin-Troitschanskaia et al., 2018). This computer-based assessment consists of a performance task in which students are confronted with a complex case scenario, for instance focusing on health or ecological topics. Students are presented with a collection of documents with additional data, which simulate the information environment students in higher education are usually confronted with. The task prompt asks students to carry out a task, i.e., to critically evaluate the case including given documents and, based on this information, to decide on a course of action, i.e., write a reasoned decision. The CAE claims that the performance task component of the CLA+ measures the following abilities: problem-solving and analysis, writing effectiveness and mechanics, reasoning scientifically and quantitatively, reading critically and evaluatively, and critiquing an argument (Wolf et al., 2015).

Drawing on this research, the International Performance Assessment of Learning (iPAL) collaborative focuses on the measurement of 21st century skills, that include critical thinking, analytic reasoning, problem solving, and perspective taking. It employs complex tasks that simulate real-life decision-making and judgment situations (for details, Shavelson et al., 2018, 2019; Braun et al., 2020). To conduct cutting-edge, fundamental research and related practical development implementations of PAs and the corresponding teaching-and-learning tools in higher education, iPAL brings together researchers from multiple countries. In particular, iPAL develops valid PAs of university students' critical thinking in different countries and also adapts these assessments from one national context to another. In this manner, iPAL contributes to enhancing the comparability, validity, and fairness in international comparisons of higher-order cognitive skills in higher education as currently required (e.g., Suter, 2019; Berman et al., 2020). This work leverages the current state of technology and research in related domains and focuses on 21st century generic skills, like critical thinking, that university students are expected to develop in order to successfully address life's everyday decisions and challenges, as well as to carry out the responsibilities of engaged, democratic citizenship (for iPAL contributions, see Zlatkin-Troitschanskaia and Shavelson, 2019). The PAs developed to measure critical thinking skills go well beyond established task formats since they employ high fidelity "real-life" decision-making contexts and challenges.

Other recently developed assessments for higher education like HEIghten by ETS (Liu et al., 2016) can be considered knowledge-based, closed response format tests of analytical thinking as they do not encompass any performance tasks (Braun, 2019; Machete and Turpin, 2020).

Digital performance assessments

Research on learning in digital or digitally supported environments and on online learning outside of institutionally controlled environments, for instance by means of mass and social media, is still scarce (for overviews, Molerov et al., 2020; Maurer et al., 2020; Zlatkin-Troitschanskaia et al., 2021). Despite the urgency of this topic for higher education, digital PA tools have so far been developed by only few projects internationally, as also our literature review presented here demonstrates.

In the following, we focus on digital PAs of generic skills, in particular critical thinking and related constructs for two reasons: (1) valid assessments of such domain-independent skills are of particular importance to life-long learning in the Internet age, and (2) they are applicable not only across disciplines and domains but also across institutions and nations. Due to this focus, however, we cannot address the full spectrum of higher education and learning topics to which digital PAs could be applied (for more general use of PAs, Braun, 2019).

Generally, digital PAs allow for measuring new complex competencies (e.g., digital literacy) or established constructs (e.g., critical thinking) in different ways. Most recently, one digital assessment of "civic online reasoning" was developed and validated in the US by Wineburg et al. (2016). In the large-scale US study, students' critical use of digital information was examined in a realistic online environment, i.e., the tasks use real websites that focus on civic, consumer, and general knowledge topics. Students are asked to perform an unrestricted online search to solve the tasks. In addition, this digital assessment was successfully implemented as a training tool to significantly promote civic online reasoning among US undergraduates in an intervention study (McGrew et al., 2018, 2019). The assessment was adapted and validated for use in German higher education (Molerov et al., 2020). The newly developed German assessment, CORA (Critical Online Reasoning Assessment), measures students' searching for, critically evaluating, selecting, processing and use of online sources and information more comprehensively. In the short performance tasks, for instance students evaluate the credibility of websites by performing an open web search, judging online information, and writing a short open-ended response for each task. The particular difficulty lies in evaluating a source in a short period of time while recognizing hidden interests and biased information representations (for details on CORA, Molerov et al., 2020).

Recently, other digital PAs were developed for higher education (for an overview, see Table A.1 in the appendix). Many newly developed digital tests focus on multiple document use/comprehension as a particularly important competence of higher education students in the Information age (for examples, Grossnickle Peterson and Alexander, 2020; Schoor et al., 2020). As new ICTs have led to an exponential increase in the data volume available in daily life (Bonikowska et al., 2019), other digital PAs for higher education

target related domains like data literacy skills, which are also considered essential for participating in the (academic and professional) world of the 21st century. Data-literate individuals for instance need to identify issues and challenges associated with this overflow of information (Leighton et al., 2021).

To provide a more systematic overview, the results of a current literature review on digital PA is presented next. It particularly focuses on students' online information processing and critical use of digital information as key competencies for successfully studying in today's learning environments. After the description of the conceptual-theoretical and methodological foundations of PA, we present the approach and central results of the literature review. The research synopsis includes a critical evaluation and international comparison of assessments and analysis approaches, their frontiers, advances, and perspectives for future research.

Conceptual-theoretical and methodological foundation of performance assessments

Over the last decade, the emphasis in educational assessment has shifted from "analytic models" of particular components of knowledge and specific skills, for which multiple-choice tests are well suited, to holistic, integrative models of performance, for which PAs are well suited (Shavelson et al., 2019). "A performance assessment [...] is an activity or set of activities that requires test takers, either individually or in groups, to generate products or performances in response to a complex, most often real-world task. These products and performances provide observable evidence bearing on test takers' knowledge, skills, and abilities—their competencies—in completing the assessment [...]" (Davey et al., 2015, p. 10). PAs, then, model and measure the outcome of learning processes not only at the level of particular learners' dispositions and abilities (e.g., domain-specific knowledge) but also at the level of their actual performance (i.e., manifested action) (for examples, see Table A.1 in the appendix).

A set of various competencies is generally required to master tasks in everyday academic and/or professional practice. A criterion-sampling, holistic approach is fundamental to the PA design that recognizes the complex multifaceted nature of 21st century skills to be measured (e.g., critical thinking) and conceives the performance as being more than the sum of its component parts, i.e., underlying individual skills (Shavelson, 2013). Real-world situations demanding these skills can rarely be segmented in ways that require only discrete skill components. Obviously, subsets of such skills are employed in sequence over the course of addressing situation-specific challenges (Corno et al., 2002). Based on Snow's (Snow, 1996) concept of aptitude, Corno et al. (2002, p. 3) refer to the concept of "aptitudes," which he defines as "all ... [those] characteristics (e.g., experience, ability, knowledge, motivation, and regulatory processes) that an individual brings to and cobbles together to perform in a particular situation." These "aptitudes" are considered dynamic since their characteristics can change depending on amendments in the (task) environment (Shavelson et al., 2002).

A holistic approach to assessment measures competencies in an environment that resembles real-life situations as closely as possible and therefore encompasses all skills and abilities that are required for meeting academic and/or professional demands needed in these situations (task scenarios) (Weinert, 2001). The holistic approach is based on the "criterion-sampling" approach to measurement (McClelland, 1973), which asserts that solving complex performance tasks requires an integrated set of abilities that cannot be validly assessed when divided into and measured as individual components. The key tenet of this approach is as follows: identifying what a learner knows and can do (e.g., search with Google), sampling real-life tasks from the domain in which that learner has to act (e.g., the Internet), directly observing participants actual performance (in this domain or an authentic simulation), and from (multiple) observations, inferring their competence and learning progress. As this is a complex process, a learners' actual ability, for instance to search with Google, cannot be assessed validly using a multiple-choice test, which would only be able to measure, for instance declarative knowledge about search operators or Internet-based beliefs. To validly measure students' actual abilities in searching, a test for searching the Internet that incorporates a sample of typical authentic searching tasks is required. Based on this sample of performance, valid inferences about a student's more general search performance can be drawn (Mislevy, 2018). However, the external validity of the measurement and generalizability of the results can be limited, for instance due to strong interactions with the scenario content; and sufficient reliability requires multiple observations, which may be difficult to realize due to the long testing time (Davey et al., 2015).

Consequently, instead of developing a "unidimensional" measurement for each particular competence sub-component (e.g., knowledge facet), typical situations are sampled from real-world contexts and are adapted for use in an assessment following a detailed design framework that provides definition of construct, organization of test, and a basis for scoring students' responses to holistically assess performance (for details, see next Section). Therefore, the PA design framework recognizes that properly addressing the situation-specific demands requires the application of combinations of knowledge and skills measured in the PA (Shavelson et al., 2019).

Performance assessment framework

A performance assessment framework specifies the construct definition, corresponding characteristics of the scenarios used, the nature and format of the materials used, and the nature of the required task-solving processes and responses to the task, i.e., performance, and scoring system (for an example, see Shavelson et al., 2019; Braun et al., 2020).

Measurement design

Most frameworks of current PAs, including the iPAL framework, are based on Mislevy's Evidence-Centered Design (ECD). With the ECD strategy, three connected models are differentiated and further specified: (1) a student model that represents the abilities that students are to exhibit in carrying out a task; (2) a task model that specifies task features that are supposed to elicit behaviors that allow inferences about these abilities; and (3) an evidence or "interpretative model" that both specifies the features to be extracted from the response and describes the way in which the test task scores are related to (latent) student abilities. The interpretative model includes the measurement model, i.e. the scoring rubrics and the statistical method for obtaining test score(s) (for additional models and more details on the ECD, [Mislevy et al., 2003, 2012](#)).

Accordingly, the PA design is based on the definition of a construct (e.g., students' abilities and mental processes) to be measured ("construct definition") as well as on a "test definition" that describes how this construct can be operationalized in order to be tested by PAs. Therefore, the following question arises: What kinds of situations (task prompts, psychological stimuli) are suited to validly measure students' abilities and mental processes in accordance with the construct definition? (for details and discussion, see [Mislevy, 2018](#)).

In the first step, a construct definition for the skills to be measured via the PA, for instance critical online reasoning, must be established. Next, a real-world situation or problem that requires these skills is selected. For instance, a defining characteristic for PAs tapping "information problem solving" and related constructs, is that elements are "manipulated" in the problem or (task) scenario that are most likely to evoke critical thinking, i.e., "the process of conceptualizing, analyzing or synthesizing, and evaluating and applying information to solve a problem or decide on a course of action or to find an answer or reach a conclusion" ([Shavelson et al., 2018](#), p. 203).

Following the criterion-sampling approach, the PA's designer samples typical, everyday situations demanding such skills (e.g., searching Google for study purposes) to create authentic performance task scenarios and to identify appropriate information sources. Documents and other types of media provided in the PA task are sampled according to three criteria: (1) the credibility of the sources, (2) the relevance of the information for the particular problem or case, and (3) the information's susceptibility to reasoning bias (e.g., authority bias, [Paul and Elder, 2005](#)) and judgmental errors, including decision-making heuristics (e.g., rational thought, [Kahneman, 2011](#); [Stanovich, 2009, 2016](#)), which are typical when students use information to make judgments and/or decisions in the real world. Thereby, different types of heuristics are incorporated into the PAs that simulate everyday situations with high fidelity.

The PA tasks are typically complex and do not offer obvious paths to solutions, decisions, or actions. They are authentic as they represent current, everyday challenges that learners face as university students, graduates, professionals and, more generally, as citizens. For instance, the PA can present situations in which deliberation is required to reason among alternative decisions or courses of action, with due regard to their consequences ([Shavelson et al., 2019](#)). The participant generates an answer to a task question, develops a product or is observed while performing a task. This type of testing enables observing the actual performance of participants from which the underlying test taker's knowledge, skills, and abilities in a professional domain are inferred ([Davey et al., 2015](#)).

For instance, the iPAL's PAs of critical thinking introduce students to a situation based on a real-world event (storyline) and ask them to take on a specific role (e.g., member of an advisory board). Students are provided with an accompanying document library that includes a selected set of documents with various perspectives and arguments from various information sources including government reports, newspaper articles, web blogs, YouTube videos, research reports, journal articles and the like. The information varies in its trustworthiness, relevance, and susceptibility to bias and judgmental errors ([Braun et al., 2020](#)). The PAs ask students to evaluate the situation they are presented with and to justify their decisions and recommendations using the information provided. The complex PA tasks generally do not admit a single solution path. Different reasoning and argumentation approaches are expected and also evident ([Shavelson et al., 2019](#); [Zlatkin-Troitschanskaia et al., 2019, 2020](#)).

As an example, one of these PA tasks, "Wind Turbine", was developed to assess higher education students' critical thinking. It consists of a realistic short-frame scenario and incorporates a document library for additional background information on the case including 22 snippets and sources of information that vary in their relevance and trustworthiness. The question at hand: Should the town approve the construction of a farm of wind turbines? Students are assigned a role in a communal real-world decision-making scenario in a German town and are asked to complete a review and to use the information provided to write a policy recommendation for a course of action, i.e., whether or not wind turbines should be built in their small town. The total test time for the PA task is 60 min. The participants are required to decide, based on relevance, which sources and arguments to select and review more thoroughly, as there is not enough time to focus on all of them ([Shavelson et al., 2019](#); [Zlatkin-Troitschanskaia et al., 2019, 2020](#)). The type of communicative action to be taken adds further formal requirements. Students receive higher scores on the PA tasks when they, for instance, (1) recognize and use credible information and avoid less-than-credible or peripheral information (facet "use of sources and arguments"); (2) avoid judgmental and decision-making "traps" and biases (facet "avoidance of, or critical reflection on, heuristics and specific distractor information"); (3) consider alternative courses of action to the one proposed and indicate why they are giving a certain recommendation; show consideration of "pro"/"con" arguments, including an explanation of different points of view in the task scenario (for details, [Zlatkin-Troitschanskaia et al., 2019, 2020](#)).

Assessment task format

Generally, PAs have an open-ended format and are typically administered on a computer platform and, increasingly often, via the Internet. Digital assessment approaches provide several significant advantages, for instance, in terms of administering tasks, collecting response process and performance data as well as in their similarity to the real world (information and learning environment

that higher education students use) they are to represent, i.e., fidelity to the criterion situation being simulated. The Internet-based assessment environment or its computer-based simulation (Intranet) enable the use of audio, video, and also computer-based simulations including virtual and augmented reality to enhance the fidelity of the task and collect students' written and/or oral responses. However, computer-based and digital assessments can be technically demanding, cost-intensive, and have specific requirements, for instance, in terms of data security and privacy.

The PAs are often accompanied by additional tasks in other formats, like short, self-contained tasks with either short answers or selected responses (e.g., multiple-choice questions), to measure students' abilities and skills theoretically related to the test construct, for instance, general intellectual abilities or other so-called conventional skills (e.g., reading skills). The use of accompanying closed test tasks can improve the reliability of the full assessment that includes the PA.

Scoring

To evaluate the students' constructed responses, analytical multidimensional scoring rubrics need to be developed based on the construct definition. Scoring rubrics should be based on all construct facets measured in PAs and include fine-grained differentiations of score levels aligned to the construct definition. This is also important in terms of the scalability of (digital) PAs. For instance, rubrics should recognize students' use of credible or untrustworthy and relevant or irrelevant information, as well as their consideration of differing arguments and perspectives. The rubric should also consider whether students tap in to, or avoid, heuristics that could lead to errors in judgment and decision-making, whether they use information provided when justifying decisions, solving problems and/or recommending certain actions, including argumentation, and the appropriate use of evidence to support their arguments (for a scoring scheme of a PA, see Zlatkin-Troitschanskaia et al., 2019; Bloom and Deyrup, 2015).

In digital PAs, the real online assessment environment constitutes a crucial aspect to be considered in a reliable scoring scheme of task performance (Molero et al., 2020). In a simulated, closed information environment with a selection of sources, an evaluation of all given information is possible. However, in an Internet-based assessment environment, an indefinitely large number of sources are available. Therefore, processing and solving PA tasks in an open environment requires a different set of skills. This substantial difference in the *task model* should be appropriately reflected in the *student model* and the corresponding scoring scheme (for examples of a scoring scheme for closed information environment, Zlatkin-Troitschanskaia et al., 2019; Brand-Gruwel et al., 2017; for examples of a scoring scheme for open assessment environment, Molero et al., 2020; Powers, 2019). The evaluation should be carried out by at least two trained scorers per task, and a high level of interrater agreement must be achieved.

A systematic literature review

A systematic literature and database research was conducted in the first half of 2020 to generate a comprehensive structured overview of digital PAs used in higher education research that focus on students' search for, selection and evaluation of online information. As a first step, key central terms, including relevant concepts and synonyms as well as data collection and analysis methods, were defined. These defined terms and operators were used to carry out a systematic database search. Two internationally relevant search engines, Education Resources Information Center (ERIC) and Google Scholar, were primarily utilized to find literature on this topic. For additional research, Research Gate was used. First, all sources published in English that address the use of digital PAs and/or online surveys of students in higher education were considered. In a first and second search phase, in which search phrases and their combinations were systematically increased and changed step-by-step, over 500 titles and abstracts that sounded relevant were identified. In the next step, numerous selection criteria were defined and applied. For instance, only sources published since 2009 were included. In addition, only empirical studies were considered for further analysis. Next, all publications that did not specifically include higher education students in their sample, as well as all studies that did not use digital PAs, were excluded. After this multi-step selection process including the screening of about 100 abstracts and the full texts of 55 publications, 19 publications remained that fully met all selection criteria and therefore were included in further qualitative analysis (for a detailed overview of the included studies, see Table A.1 in the appendix).

Current state of research that includes (digital) performance assessments in higher education

All 19 publications employed digital performance tasks to measure students' online information processing (and/or related constructs such as "information problem solving" (Brand-Gruwel et al., 2017), "critical online reasoning" (Molero et al., 2020) and students' actual use of online media for study purposes). However, their specific research foci and scope of the analysis differed greatly. For instance, some digital PAs capture the complete search process (Bloom and Deyrup, 2015; Hargittai et al., 2010), while others focus on the (critical) evaluation and/or selection of online sources (Leeder and Shah, 2016) or the use of specific (domain-specific) databases (Dahlen et al., 2020; Furi and Balog, 2016).

The topics varied as well. Their scope ranges from the domains of medicine, economics, and linguistics (Judd and Kennedy, 2011; Raido, 2013) to less domain-specific contexts, for instance societal and health topics (Nagel et al., 2020; Quinn et al., 2017). Every study included had a local, regional, or national, but never cross-national scope. About half of the studies ($n = 9$)

were conducted in the USA, four studies were conducted in Germany, and one study each was conducted in the Netherlands, Croatia, UK, New Zealand, Australia, and Turkey.

The digital PAs were mediated by a computer and/or video recordings. Log file data were collected frequently ($n = 9$) as well as audio (voice) recordings ($n = 1$), and/or think-aloud approaches ($n = 7$) to collect students' response processes and performance data. Two studies collected data using eye-tracking (for an overview, see [Table 1](#), for more detailed information on the studies, see [Table A.1](#) in the appendix). In addition to quantitative approaches, qualitative analyses were often conducted to evaluate the collected data. In all studies, the students' answers and in some cases their online behavior while processing the PA task was rated using (original) scoring schemes (e.g., [Nagel et al., 2020](#)). Quantitative analyses were carried out, for instance when examining the processing time required and/or the number of clicks for task completion. The collection of log data ($n = 7$) allows the use of complex analysis methods, including process mining ([Schmidt et al., 2020](#)).

In addition to the collection of screen and/or video recording and log file data, self-reporting was deployed in all studies to obtain further information, for instance, regarding the participants' Internet-related beliefs ([Salehi et al., 2018](#)). Selected-response items with Likert scaling were mainly used for this purpose. Moreover, socio-demographic data (e.g., gender, age), were usually collected.

The majority of the 19 studies (17) have a cross-sectional design (some with a treatment and a control group). The other two are intervention studies which used a pre-post-design ([Rosman et al., 2015](#); [Weber et al., 2018b](#)). Apart from this, there was no study with a longitudinal design.

The studies show a wide range regarding the number of participants (minimum = 4; maximum = 842). Most of the studies report a sample of up to 55 participants ($n = 15$). Notable are the studies by [Judd and Kennedy \(2011\)](#) with 842 and the study by [Hahnel et al. \(2018\)](#) with 310 participants.

In most studies, students from different study semesters were surveyed. Across all studies, both beginning and advanced students and graduates were assessed (for an overview, see [Table A.1](#) in the appendix).

The studies illustrate various PA approaches to measuring students' online information use and related skills. They do not focus on single skills and/or knowledge facets but rather address multidimensional competence constructs needed for solving the PA tasks. A majority of the studies ($n = 11$) applied PA tasks with computer-based simulations, i.e., created a closed, controlled assessment environment in which the participants were asked to conduct research on a given topic. However, no studies could be found that apply virtual or augmented reality (though such studies are available in school education). While some studies used several tasks that differed in their level of complexity and difficulty, many others relied on but one or a few tasks with equal levels of difficulty. Some studies provided a particular pre-selected website in a PA task and requested the participants to assess it in terms of credibility and trustworthiness. Approximately half of the studies focused on a free web search that students had to conduct to solve the PA task. In these, the comparability of participants' test results, however, is limited since each student's search created a unique task environment. At the same time, this type of assessment is more authentic and ecologically valid, offering a much more detailed representation of students' actual performances that supports its validity (for details and discussion, see [Molero et al., 2020](#)). Notably, in four studies, participants were asked to investigate their own research topic or a topic of interest. This may positively influence test motivation and therefore test performance in comparison to PA tasks with a given topic. However, again, the comparability of students' performance is limited in these cases because of topic variation.

Table 1 Used methods.

In two studies, participants were not given specific tasks. Instead, the students were observed, and their research process was recorded via screencast as they worked and searched the Internet to prepare documents relevant for their classes (Bloom and Deyrup, 2015; Tylor, 2015). For instance, the participants of one study had to translate a popular-science text from Spanish into English for a class and were asked to use the Internet as an external resource of consultation (Raido, 2013). Overall, since all PA tasks reviewed can be considered to be complex, they differ considerably, for instance, in terms of real (i.e., Internet) or simulated assessment environment, including psychological stimuli such as potentially conflicting information of diverse quality and scope.

Advantages and challenges of (digital) performance assessments in higher education

Through examination of these 19 studies, an emerging multidisciplinary field of research on digital PAs in higher education becomes evident. It specifically focuses on students' online information processing and (critical) use of online information in study-related contexts. The more critical review of current research studies reveals that existing research using digital PAs is characterized by both various advantages and shortcomings. In general, digital PAs enable measuring of new complex competency constructs (e.g., critical online reasoning) or established constructs (e.g., multiple source use) in a more objective and valid way. Most studies are characterized by innovative PA designs, and in many studies, the collected data were used for innovative analyses (e.g., process mining), which provide novel insights into student learning in various (digital) contexts and student learning outcomes.

However, one of the shortcomings of the current state of research is that process data were collected and analyzed in less than half of the studies. In this respect, the particular potential of digital PAs not only for measurement purposes but also in terms of (improving) student learning in the higher education practice remains untapped. This is because particularly important information about the learning processes of students can be obtained on the basis of response process data (Kane and Mislevy, 2017; Zumbo and Hubley, 2017). By means of learning analytics, student learning can be supported quite significantly through the use of digital assessments (Drachler and Goldhammer, 2020; Jivet et al., 2020).

Another major limitation of current research is its highly exploratory and descriptive character. Many studies did not employ theory-based research hypotheses, and the results obtained using digital PAs are mainly considered in terms of the extent and level of the students' skills investigated. The development of these skills and the possible connections to university study contexts and actual student learning were explicitly considered in but two intervention studies. In this context, there is also a lack of longitudinal studies that capture and analyze the development of students' skills through the course of study using digital PAs.

The complexity of the analyzed studies is also reflected in the scope and amount of collected response process and performance data. For instance, interview data from think-aloud protocols or eye-tracking data were analyzed quantitatively, qualitatively, and via more innovative mixed-methods approaches (see Table 1). However, as the use of qualitative methods is typically very time- and resource-consuming, samples are often small and range from 10 to 50 participants in most studies. Since current and ongoing technological advantages and more complex analytical methods enable the evaluation of "big" learning data, the collection and analysis of larger samples must be extended and improved so that future research in this field can provide more valid and generalizable findings (Mislevy, 2018).

Another limitation is the local or regional scope of the research identified. None of the studies pursued an explicitly comparative focus, for instance, between students from different content domains, study groups or universities. Nor could any internationally comparative study be found. In a digitalized world, however, cross-national comparative studies, especially in higher education, are highly important to provide more evidence on student learning in the global information and learning environment, i.e., the Internet. The use of digital PAs, in particular, provides the opportunity for international deployment. For instance, performance and process data (e.g., log files) of test takers can be collected from anywhere and anytime (e.g., in different time zones simultaneously). However, in contrast to these and further opportunities, digital testing also poses specific technical challenges. For instance, the methods used to collect data often require specific technical conditions and/or additional on-site support (Newman et al., 2021). Moreover, additional challenges in terms of translation and adaptation and the comparability of PAs arise (e.g., Ronderos et al., 2021). As recent studies indicate, it is not enough to simply deploy digital assessment across countries. Rather, test administration procedures and analyses need to be comparable to ensure the comparability of the test results. This includes the implementation of similar processes across countries and institutions for pretesting, sampling, task administration, incentivization, validity and comparability analyses (ITC, 2017; for more details on the challenges of international assessment, see e.g., Suter, 2019).

Many of these strengths and limitations lie in the nature of digital PAs, and they are outlined in more detail in the following by highlighting specific advantages and challenges for higher education and student learning practice and research.

Potential for educational practice

After establishing the reliability and validity of the digital PA, these tools can be used effectively by universities nationally and cross-nationally (1) to produce valid summative measures and (2) formatively evaluate individual students and/or groups of students (Shavelson et al., 2019). The potential for the formative use of PAs in classrooms targeting students' skills in real-world situations is especially promising and twofold. The PAs can be used to measure students' learning in higher education and to train students (and teachers) in the assessed skills. In this way, and in the sense of the so-called "Curriculum-Instruction-Assessment Triad"

(Pellegrino, 2002), the digital assessment can improve both teacher instructions and student learning and therefore contribute to better learning outcomes in higher education and beyond.

In addition, by using PAs, universities can generate evidence in terms of the efficacy of courses of study and co-curricular/instructional activities (Braun, 2019) to ultimately improve teaching and learning in higher education. Therefore, the most important use for PAs is in the classroom, where tasks, e.g., with computer-based simulations (possibly including virtual and augmented reality) can provide the basis for problem-based and/or simulation-based learning models (Chernikova et al., 2020) and for innovative pedagogical interventions (Berliner, 2020). The problem-based learning (PBL) model proposes that well-designed and authentically presented real-life problems can motivate students to solve more challenging tasks than they would otherwise be inclined to do. Such tasks can encourage critical questioning and elaboration by presenting authentic and interesting situations and real-life simulations (Barrows, 1996). Research on interventions based on PBL indicate that such approaches can support deeper learning and transfer (Gijbels et al., 2005; Strobel and van Barneveld, 2009) as required for and in higher education.

Digital PAs can drive innovation of assessment practices and online learning, even beyond formalized higher education contexts (for a discussion of more general use of PAs, see Braun, 2019). For instance, the case-based PA task format is suited for reproduction and use in further technological contexts, e.g., virtual and augmented reality. It is likely to spark the development of both assessment tasks and accompanying teaching-and-learning materials, such as online (self-)assessments, training materials, and video courses. For instance, the Stanford History Education Group, successfully transferred research with PAs into a series of online training videos aimed at the average consumer (Crash Course Navigating Digital Information). Thus, based on (digital) PAs and their results, instructional interventions in higher education can be designed, for instance, to train students how to competently use and reason from online information and equip them with the skillset necessary for acquiring high-quality knowledge using the Internet (for examples in teacher, law, and medicine training, see Zlatkin-Troitschanskaia et al., 2021). This can help universities to fulfill their educational mandate in the context of growing global competition stemming from the Internet.

Challenges of implementing and using performance assessments in higher education

PAs provide numerous opportunities to holistically measure students' complex, multifaceted competencies and learning outcomes by using authentic real-life and professional tasks. The PAs present specific (task) situations that require students (individually or in groups, e.g., in classrooms) to create performances and/or products in response. These performances and/or products provide evidence on the basis of which inferences of the students' complex competencies and higher-order cognitive skills can be made — within or across academic and/or professional domains.

This type of assessment is accompanied by specific challenges that need to be considered in educational research and practice. First, as the considerations on PA design demonstrate (see Section **Performance assessment framework**), PA tasks are challenging to create and implement, and they require intensive pre-testing and validation work to relate students' test performances to a score by using a differentiated rating scheme (e.g., Molerov et al., 2020).

Second, the more general challenge lies in the nature of PAs, which involve complex, real-world tasks (i.e., simulations) and corresponding, open real-life responses that are usually complex, relatively long, often nonstandardized and limited due to (test) time and cost factors. This leads to the issues of limited reliability, validity, and scalability of (digital) PAs (see Section **Performance assessment framework** and below).

More specifically, there are numerous methodological and psychometric challenges, as discussed, for example, in Davey et al. (2015), Shavelson et al. (2018), and Mislevy (2018). First, most commonly used measurement and psychometric models were developed for closed, standardized, selected response questions (e.g., multiple-choice tasks). In these assessments, several discrete test tasks are scored dichotomously and often organized into particular scales that measure one distinctly defined (unidimensional) construct (e.g., fluid intelligence). That is usually not the case in the PAs, which holistically measure student's ability to demonstrate multiple skills, so that the interpretation of the test results and inferring students' abilities from actual performance are demanding (Shavelson et al., 2019; Zlatkin-Troitschanskaia et al., 2019).

Second, the ordinarily limited number of observations leads to additional specific challenges since standard measurement and psychometric models, especially those modeling and assessing complex, multifaceted, latent constructs, typically require a large number of observations of performance to infer the assessed construct (e.g., critical thinking) to achieve an acceptable model fit (e.g., Zlatkin-Troitschanskaia et al., 2019). However, (test) time and costs for PAs, for instance, regarding scoring of open responses, lead to a practical limitation in terms of the possible number of observations. As the literature review also illustrates, most studies only used one or a few PA tasks and only a limited number of students (see Table A.1 in the appendix).

In this respect, reliable scoring poses a significant challenge and limitation, as responses to a PA cannot generally be scored dichotomously but typically require the application of multiple rubrics, resulting in multiple, varied, and more unusual score scales of different types (for examples, Bloom and Deyrup, 2015; Zlatkin-Troitschanskaia et al., 2019). In cases where response process data (e.g., log files) are collected in addition to performance data, further process-related indicators, such as response time, number of clicks, etc., need to be used (e.g., Nagel et al., 2020; Schmidt et al., 2020).

A corresponding challenge, therefore, lies in human rating and the associated limitations in terms of reliability and validity of scoring. Student responses and/or observations in PAs are usually scored by trained raters, according to defined scoring rubrics. Despite high-level intensive training, limitations resulting from rater inaccuracy and rater variation (e.g., interrater reliability) cannot be fully ruled out and can lead to significant measurement errors. Although the use of PAs in the classroom promises many pedagogical advantages, the evaluation and analysis of these data is particularly challenging, as the responses can be

influenced by all students in a group. In this context, one particularly promising perspective can be the development of computer models for (semi)automated scoring based on students' written responses (for successful examples of computer scoring in educational assessment research, e.g., [Wahlen et al., 2020](#)). Computer-based scoring can provide the basis for learning analytics-based tutoring systems with automated, real-time feedback sensitive to online context, content, and learning process (e.g., alerting students to suitable verification steps based on textual cues or timing in web behavior). However, valid and reliable computer scoring of open-ended responses pose numerous specific challenges (for examples, [Horbach and Zesch, 2019](#); [Wind et al., 2018](#)).

Conclusion

The assessment of student learning outcomes and learning development has gained increasing importance in recent years. The selection of suitable measuring instruments is crucial, as each instrument has its strengths and limitations. In addition to traditional on-site PAs, there are assessments conducted in a digital format, which are increasing in number ([Braun, 2019](#); [Oliveri and Mislevy, 2019](#)). This trend has amplified, especially in recent years and due to the Covid-19 pandemic.

This chapter has provided a systematic, structured overview of different types of (digital) PAs, their application in educational research and practice, including the opportunities for improving student learning as well as challenges arising from their creation and use. For this purpose, a comprehensive literature review was conducted. To create comparability between the assessments presented, the research was further focused on digital PA when measuring students use of online information, critical thinking, and related constructs. Consequently, this review could not address the full spectrum of higher education and student learning topics to which (digital) PA could be applied (for more general uses of PAs, [Braun, 2019](#)).

Today, students' learning using the Internet has become one of the most vital prerequisites for academic success in higher education. Prior research indicated that Internet-based learning includes collecting, comparing, managing, evaluating, and applying information in a critical manner to make effective decisions in knowledge-based and technologically rich environments. Therefore, this literature review focusses on the current state of research using increasingly popular digital PAs to measure student learning progress and outcomes.

PAs are complex tasks and attempt to simulate the real world as closely as possible. These authentic tasks are drawn from real-life situations and follow a holistic approach to measure complex, multifaceted competences important for meeting specific (e.g., academic and/or professional) demands. These competencies cannot be neatly divided analytically into single components and are therefore analyzed by observing the distinct processes/steps the students go through when handling a PA task and their overall performance ([Shavelson et al., 2019](#); [Schmidt et al., 2020](#)).

The high level of authenticity is particularly attractive when measuring professional and/or academic skills. For instance, at the end of a student's course, the PA can provide evidence on how competent the student is in the course-related subject, as well as evidence on which job-related knowledge and skills the student has acquired. The use of digital PAs offers ground-breaking possibilities in educational teaching and assessment practice. Particularly, this enables the valid measurement of complex competencies constructs like critical thinking, for instance due to the high ecological/"face" validity and the collection of response process data (e.g., log files), which allows for complex subsequent analyses (e.g., process mining), learning analytics-based feedback and more individualized instructional interventions. Ultimately, in this way, the digital PAs can substantially contribute to improving educational practice and student learning in digital contexts.

Although PAs offer many opportunities, test developers, researchers and educators are faced with a number of conceptual, technical, and methodological challenges when creating and using them in research and practice (see Section **Challenges of implementing and using performance assessments in higher education**). For instance, the scoring and (qualitative) analysis of response process and performance data can be very time- and resource-consuming ([Dolan and Burling, 2018](#)). This results in small samples and cross-sectional (not longitudinal) designs, as revealed in the literature review presented here and which go along with various limitations, for instance, regarding the internal and external validity and limited generalizability of results. Moreover, no international study using digital PAs in higher education could be found.

Overall, by providing a comparison of different PAs at an international level this literature review particularly contributes to a greater transparency regarding existing research, its interrelationships, and overlaps. We hope that our critical discussions and suggestions for further research motivates much needed cross-national comparative studies in this field (for a critical review on the development of large-scale international comparative studies, see [Suter, 2019](#)).

Acknowledgment

This study is part of the PLATO project, which is funded by the German federal state of Rhineland-Palatinate. We would like to thank our student assistant Jan Krstev, who supported us in conducting the literature review.

Appendix A

Table A.1 Selected studies.

<i>Number, authors, title, year</i>	<i>Focus of study</i>	<i>Method</i>	<i>Sample</i>	<i>Method of evaluationQualitative data analysis (QUAL);Quantitative data analysis (QUAN)</i>	<i>Study design</i>	<i>Scope</i>
1. Bloom and Deyrup (2015)	Online research behaviors as well as emotive and affective responses	Task: Self-selected online research tasks by using the software (OpenHallway) Screen casting and voice recording while conducting online class research Think aloud Post-questionnaire on students' perceptions of research history and level of success, feelings about and experience doing scholarly research	42 undergraduate students (sophomores, juniors, and seniors) enrolled in courses that required a sizable research project	QUAL: Coding of student responses (coding schema with eight categories) QUAN	Cross-section analysis	United States
2. Brand-Gruwel et al. (2017)	Evaluating and selecting online sources	Tasks: two information problem-solving tasks; selecting results best suited with a Google-like-SERP consisting of a selected mix of existing websites as a basis for writing an article (offline setting) Thinking aloud Cued retrospective reporting instruction Eye tracking Log-file analysis Questionnaire on the use and functioning of search engines Written free recall task on prior topic knowledge	19 domain novices (15 first semester Psychology students; 4 prospective students) and 16 domain experts (university Psychology teachers)	QUAL: Scoring task performance (coding scheme for evaluation search results, websites and information) QUAN: eye-movement data analysis, log-file analysis	Cross-section analysis	Netherlands

Table A.1 Selected studies.—cont'd

<i>Number, authors, title, year</i>	<i>Focus of study</i>	<i>Method</i>	<i>Sample</i>	<i>Method of evaluationQualitative data analysis (QUAL);Quantitative data analysis (QUAN)</i>	<i>Study design</i>	<i>Scope</i>
3. Dahlen et al. (2020)	Research using two categories of search tools Use of search features; search facets	Tasks: two search tasks; both on finding two suitable articles on a topic for writing a paper. Useable search tools: EBSCO's Social Sciences Abstracts and ProQuest's Summon Screencasting Semi-structured interviews (ex post)	50 juniors and seniors majoring in Social and Behavioral Sciences 26% upper-level majors	QUAL: Coding student search behavior and use of search features (i.e., discovery systems and traditional library databases); Scoring articles used by participants analyzing student interviews (impressions of search tool, reason for selecting articles, and level of extent participant considered publication date, credibility, and relevance) QUAN: time needed, number of clicks for task completion, number of search steps, sequence of steps	Cross-section analysis	United States
4. Furi and Balog (2016)	Actual information-seeking behavior	Tasks: three simulated search tasks to be solved by searching the Internet, the second by some of the scholarly databases, and the third by using the library's OPAC Think-aloud Video recording Questionnaire on demographics, students' information literacy, educational background, and self-perception of their information seeking expertize	6 social science graduate students ($n = 3$ Information Science, $n = 1$ Psychology, $n = 1$ Economics, $n = 1$ Cultural Management)	QUAL: sources used, emotions during task, success at completion of task QUAN: time needed, number of clicks for task completion, number of search steps, sequence of steps	Cross-section analysis	Croatia
5. Hahnel et al. (2018)	Multiple document comprehension	Task: Computer-based multiple document comprehension test - Simulated search task with corresponding search engine result page(s) (SERPs) Log-file analysis Questionnaire on demographics	310 German university students enrolled in several bachelor's or master's programs in the Social Sciences and Humanities 70% bachelor and 30% master students	QUAL: Scoring students' selection of the most informative and credible SERP link (dichotomous scoring scheme) QUAN: generalized linear mixed models used for statistical analyses carried out in R	Cross-section analysis	Germany
6. Hargittai et al. (2010)	Finding and evaluating Web content	Task: 12 open web searches, ranging from locating information about current events to emailing House Judiciary Committee, accessing literature, finding information on	Observation and interview: – 102 first-year students from a first-year writing program at an urban public research university	QUAL: Coding data obtained via audio recording QUAN: Respondents' Internet use experiences and questions about the credibility (using a Likert scale)	Cross-section analysis	United States

(Continued)

Table A.1 Selected studies.—cont'd

<i>Number, authors, title, year</i>	<i>Focus of study</i>	<i>Method</i>	<i>Sample</i>	<i>Method of evaluationQualitative data analysis (QUAL);Quantitative data analysis (QUAN)</i>	<i>Study design</i>	<i>Scope</i>
		health matters, finding best practices in poster layout and information on Microsoft Word settings, assessing person's gender based on first name, find authoritative source for writing resume Think aloud and Screencasting Paper-pencil questionnaire on students' Internet use and assessment of online materials Follow-up in-person observations and interviews on students' level of understanding of 27 Internet-related terms	– 23% Health Sciences, 15% Science, 13% Business, 10% Social Science, 11% Math/Computer Science/ Engineering, 8% Nursing, 7% Arts/ Humanities, 7% Architecture/Design, 5% Education			
7. Holman (2011)	Information-seeking behavior and search strategies Choice of search tools and search engine queries	Task: Conducting research in chosen search engines or article databases in a university usability lab for about 1 h over a 3-week period Think aloud Video screening Semi-structured interview (ex post) Students' visual diagram of the relationship between their search terms and the items retrieved by the search tool	21 first-year undergraduate students	QUAL: Analyzing think aloud protocols, video recordings & captured searches (use of search engines and databases, use of Boolean operators, use of punctuation, use of keywords and synonyms)	Cross-section analysis	United States
8. Introduction

The use of static and dynamic information about learners, teachers, and learning environments for real-time modeling, prediction, and optimization of learning processes, learning environments, as well as educational decision-making is often referred to as learning analytics (Ifenthaler, 2015). Hence, learning analytics draw on an eclectic set of data and methodologies to provide summative, real-time, and predictive insights for improving learning, teaching, and organizational efficiency (Lockyer et al., 2013; Long and Siemens, 2011). While the field of learning analytics is receiving a lot of attention for its capacity to provide lead indicators of student failure (Sclater and Mullan, 2017) or student success (Ifenthaler et al., 2019), it has focused to date on individual courses in isolation, rather than the capabilities of educational organizations in general (Gašević et al., 2015). However, the implementation of learning analytics at educational organizations may have broad implications for the organization (e.g., technological infrastructure, policies and regulations) and its stakeholders (e.g., students, academic staff, administrators) including changes in learning culture (Ifenthaler, 2020).

The adoption of learning analytics within an educational organization is depending on several factors including technological systems, regulations and guidelines, as well as professional development of involved stakeholders (Ifenthaler, 2017). Learning analytics ready technological systems are required to process vast amounts of available educational multimodal data, flexible data mining tools, and advanced statistical methods including machine learning algorithms (Berland et al., 2014). Learning analytics ready regulations observe data privacy legislation and ethical consideration of (semi-)automated recommendations (Prinsloo and Slade, 2014). Learning analytics ready stakeholders demonstrate educational data literacy, understood as the ethically responsible collection, management, analysis, comprehension, interpretation, and application of data from educational contexts.

Accordingly, the degree of adoption of learning analytics within an educational organization is a measure of the number of technological systems and organizational regulations implemented as well as the number of stakeholders using learning analytics or who have altered their practice because of learning analytics. This article provides an overview on learning analytics and its benefits for educational organizations. It further reflects on the factors which influence the adoption of learning analytics including change management processes.

Overview on learning analytics

There are several concepts closely linked to processing, analyzing and visualizing educational information. However, these concepts are often confused and lack universally agreed as well as applied definitions. Educational data mining refers to the process of extracting useful information out of a large collection of complex educational datasets (Berland et al., 2014). Academic analytics are the identification of meaningful patterns in educational data in order to inform academic issues (e.g., retention, success rates) and produce actionable strategies (e.g., budgeting, human resources) (Long and Siemens, 2011). Teaching analytics focus on data from classroom management and interactions between teachers and students (Sergis and Sampson, 2017). School analytics capture organizational data including information about management, decision-making and staff capabilities (Sergis and Sampson, 2016). Assessment or measurement analytics emphasize the importance of the diagnostic opportunities of educational data. Hence, the concept of learning analytics has been used in various contexts and with different perspectives, resulting in a lack of clarity and precise definition (Wong et al., 2019).

Current learning analytics research and practice are spearheaded in Australia, USA, and United Kingdom confirming the added value for addressing issues related to study success and identification of students-at-risk (Sclater and Mullan, 2017) as well as for monitoring and improving organizational capabilities (Ifenthaler et al., 2019). Wong (2017) presents several case studies utilizing learning analytics for (a) improving student retention, (b) supporting informed decision making, (c) increasing cost-effectiveness, (d) helping to understand learning behavior, (e) providing personalized assistance, and (f) delivering feedback and interventions. Another work by Ifenthaler et al. (2019) focusses on utilizing learning analytics for study success which has been a global concern for many years (Tinto, 2005). Further research has concentrated on ethics and privacy issues linked to learning analytics, discussing

ethical dilemmas of intervention strategies (West et al., 2016), the ethics of categorizing at-risk students (Scholes, 2016), student perceptions and expectations of data privacy (Ifenthaler and Schumacher, 2016), and ethical oversight of student data (Willis et al., 2016). A generally accepted finding includes the requirement of defining who has access to which data, where and how long the data will be stored, and which procedures and algorithms to implement for further use of the available data (Ifenthaler and Schumacher, 2019; Pardo and Siemens, 2014). Dashboards and visualizations have been identified as another major focus area in learning analytics research (Sahin and Ifenthaler, 2021). Hence, the still emerging field of learning analytics has introduced new frameworks, methodological approaches, and empirical investigations into educational research; for example, novel methods in educational research including machine learning, network analyses, and empirical approaches based on computational modeling experiments (Chatti and Muslim, 2019; Dyckhoff et al., 2012; Gašević et al., 2019a).

From a holistic perspective, educational organizations and involved stakeholders can derive multiple benefits from learning analytics by using different data analytics strategies to produce summative, real-time and predictive insights and recommendations which can be associated with four levels of stakeholders: mega-level (governance), macro-level (organization), meso-level (curriculum, learning design, teacher/tutor), and micro-level (learner) (Ifenthaler, 2015). The *mega-level* facilitates cross-organizational analytics by incorporating data from all levels of learning analytics initiatives. Based on common data standards and open data schemas, rich datasets may enable the identification and validation of patterns within and across organizations and therefore provide valuable insights for informing educational policy making. The *macro-level* enables organization-wide analytics for better understanding learner cohorts to optimize associated processes and allocate critical resources for reducing dropout or increasing retention as well as success rates. The aforementioned levels can be associated with the emerging domain of Educational Leadership Data Analytics (ELDA) which is centered at the intersection of education leadership and education data analytics (Bowers et al., 2019). The *meso-* and *micro-level* provide analytics insights within entities of the organization (Ifenthaler and Widanapathirana, 2014). At the meso-level, learning designers may use analytics insights in order to improve learning artifacts or the sequencing of learning tasks as well as overall curricular design (Ifenthaler et al., 2018). The micro-level focusses on learning-processes of individual students adapting to their current needs in the learning process and helping them to reflect and act on recommendations based on multiple analytics insights (Gašević et al., 2017).

An essential prerequisite of learning analytics benefits, however, is the perspective of data and analytics involved: (1) summative and descriptive; (2) formative and (near) real-time; (3) predictive and prescriptive. The *summative and descriptive* perspective provides detailed insights after completion of a learning phase (e.g., study period, semester, final degree), often compared against previously defined reference points or benchmarks. The *formative and (near) real-time* perspective uses ongoing information for improving processes through direct interventions on-the-fly. The *predictive and prescriptive perspective* is applied for forecasting the probability of outcomes in order to plan for future interventions, strategies, and actions.

In order to fully develop the multiple benefits of learning analytics, a better understanding about reliable and valid indicators for supporting learning analytics is needed. Yau and Ifenthaler (2020) reflect on the effectiveness of learning analytics indicators. In summary, student study history such as GPA or evaluating the learners' learning progress from assessment results are the most successful key indicators. However, for entry-level courses or first-year students, historic academic performance or study history may be unavailable (Mah and Ifenthaler, 2017, 2020). Hence, quiz results in the first week can be used to obtain this information to make the appropriate analysis. In MOOCs, clickstream data seem to be the key indicators, as performance and demographic data may not be available due to limited data collection and privacy issues (Hlosta et al., 2017). Regarding the distribution of indicators mapped on three data profiles (student, learning, curriculum) (Ifenthaler and Widanapathirana, 2014) it becomes apparent that indicators related to the curriculum profile are underrepresented. As such curriculum related indicators may function as benchmarks for formative feedback and (near) real-time scaffolds as well as for improving the learning design, it is suggested to further investigate the benefits and usability as well as the validity of such indicators (Yau and Ifenthaler, 2020).

Adoption of learning analytics

Since a decade, the potentials of learning analytics for educational organizations have been discussed (Pistilli and Arnold, 2010), however, there remains a lack of organization-wide examples demonstrating a systematic and holistic adoption of learning analytics (Gašević et al., 2019b).

In a recent systematic review including over 6000 initial studies on learning analytics, Ifenthaler and Yau (2020) indicate that a wider adoption of organization-wide learning analytics systems is needed. While standards for data models and data collection, such as xAPI (Experience API), exist (Kevan and Ryan, 2016), learning analytics research and development needs to clearly define standards for reliable and valid indicators, informative visualizations, and design guidelines for pedagogically effective learning analytics interventions (Seufert et al., 2019; Yau and Ifenthaler, 2020).

Accordingly, the adoption of learning analytics within an organization involves an organizational diffusion process including communication channels between potential actors, who then follow a well-known decision-making process (i.e., moving from unawareness to knowledge, then being persuaded that learning more will be beneficial, then trying out the change, then moving into routine implementation, and finally creating confirmatory data and helping others) as the stakeholders individually adopt or ignore the innovation of learning analytics (Rogers, 1962; Kotter, 2007). Influencers who wish to promote the adoption of learning analytics must ensure and secure open communication channels and encourage people to start and stay on the journey of decision-making from awareness to action (Drachler and Greller, 2016; Colvin et al., 2015; Ifenthaler and Gibson, 2020).

However, an international study on the adoption of learning analytics revealed that there is a lack of staff available for learning analytics projects (Ifenthaler, 2017). Specialized staff with a strong background in learning and teaching as well as data science are in short supply. For example, only 25% of the organizations included in the study report that they employ learning analytics specialists. Similarly, the findings clearly indicate that educational organizations do not have the necessary technology available to implement valid learning analytics frameworks. For example, only 19% of the organizations report that they have implemented a working data warehouse. Accordingly, only a small number of educational organizations meet the high staff and technology requirements for learning analytics frameworks (Kevan and Ryan, 2016).

Nonetheless, more recent research focusing on the adoption of learning analytics reports high interest among higher education organizations (Ifenthaler and Yau, 2019; Tsai and Gasević, 2017). On the same time, the maturity level of available organization-wide learning analytics systems is still low, i.e., organizations are aware of learning analytics and start experimenting with dashboards for students and teachers, however, they are far from organizational transformation (Siemens et al., 2014; Viberg et al., 2018). Accordingly, learning analytics remains an interest for educational organizations rather than a major priority (Lester et al., 2017; Ifenthaler and Yau, 2019).

Therefore, actionable frameworks and adoption models focusing on learning analytics are required for successful integration of learning analytics systems into educational organizations (Buckingham Shum and McKay, 2018; Dyckhoff et al., 2012). However, these models may vary across different organizations due to contextual idiosyncrasies as well as in different countries due to cultural differences (Klasen and Ifenthaler, 2019; Schumacher et al., 2019). The current state of adoption and implementation of learning analytics in educational organizations may be a paradoxical exercise. On the one hand, world-class experts in data science, information systems, management, educational leadership and learning science may be part of the research organization. They all could contribute to relevant developments of robust learning analytics systems. On the other hand, these experts may only have loose insights into the requirements of learning analytics when it comes to questions of implementation or the administration is not interested in their expertise for organizational development of the institution. Further, as bureaucracy takes over, these experts may not be interested in facilitating change processes at their home organization. In order to overcome such organizational barriers, Buckingham Shum and McKay (2018) suggest organizational architectures including pros and cons: (a) The IT Service Center Model assumes that the learning analytics system is developed and implemented through IT services of the organization. The pros of this model are clearly on the technical side, as all systems (e.g., learning management system, data warehouse, student information system, etc.) are managed by this unit. Faculty may not have the opportunity to guide the development and implementation of the learning analytics system. In addition, an evidence-centered approach driven by academic faculty is unlikely. (b) The Faculty Academics Model assumes that academics conduct research and drive the implementation of a learning analytics system. Through evidence-centered research and development, immediate and robust findings are produced with regard to acceptance, effectiveness, and challenges involved when implementing learning analytics systems. (c) The Innovation Center Model assumes an autonomous entity of the educational organization which is well connected to faculty and administrative services. Partnerships among all stakeholders are vital for the success of this model. When overall accepted, this model combines the strengths of the aforementioned models (Buckingham Shum and McKay, 2018).

Change management

Alongside the evolving social and organizational context, educational organizations must transform its processes to accommodate new conceptualizations of student capability and success (Vey et al., 2017). In particular, higher education institutions must reconsider five important dimensions of learning and teaching operations (Henry et al., 2020): (1) finding and selecting students; (2) knowing learners and their expectations; (3) just-in-time services, content, mentoring and support; (4) anytime, anywhere accessibility; and (5) global connectivity. These operation can only be reached through implementing change management processes which involves all stakeholders and considers organizational, technological, and staff readiness for change (Kotter, 2007).

While organizations choose to invest into advancing learning analytics capabilities, they will encounter several adoption challenges (Drachsler and Greller, 2016; Leitner et al., 2019; Tsai and Gasević, 2017). Accordingly, a comprehensive change management strategy for implementing actionable learning analytics seems to be pivotal. As a first step, a readiness assessment is conducted while referring to the above mentioned benefits of learning analytics introduced by Ifenthaler (2015). Based on the initial step of identifying the to be achieved benefits of learning analytics, the educational organization needs to carefully build a strategy based on an in-depth review of existing practices, procedures, and capabilities. Hence, the strategy includes decisions which benefits and specific features of learning analytics to be included as well as which infrastructure for a successful learning analytics implementation is required. The second step includes the readiness assessment using standardized instruments. Data for the readiness assessment is collected on organizational level, i.e., organizational readiness (e.g., existing policy, data protection regulation), with a specific focus on necessary technology, i.e., technical readiness (e.g., data warehouse, system integration), and with regard to capabilities staff members of the education institutions possess, i.e., staff readiness (e.g., educational data literacy) (Schumacher et al., 2019; Ifenthaler, 2017).

Based on the results of the in-depth readiness assessment, the resulting implementation strategy covers all areas of change. Further, the stepwise implementation of learning analytics needs to be monitored and evaluated with regard to predefined and measurable KPIs (Key Performance Indicators). More importantly, the return on investment, defined as the expected gains (returns) per unit of cost (investment) of a variety of potential actions need to be monitored closely (Psacharopoulos, 2014). The return on

investment may not only be conceptualized as monetary returns, but may also be returns conceptualized as retaining students, or improving staff and student satisfaction (Gibson et al., 2018). Clearly, the change management process of an educational organization is a time-consuming process and requires acceptance among all involved stakeholders. A change management strategy for implementing actionable learning analytics in educational organizations could be guided by the following principles (Leitner et al., 2019; Tsai and Gasević, 2017; Ifenthaler, 2020):

- Definition of the learning analytics vision and objectives (e.g., using the above mentioned benefits matrix) and align them with the organizations mission and learning culture;
- Identification of organizational, political, or technological factors that will affect the implementation;
- Involvement and continuous information of all stakeholders including students, teachers, administrators, etc.;
- Development of (and continuously update) a strategic plan focusing on short-term and long-term wins, including a needs and risk analysis as well as a clear timeline outlining responsibilities of involved stakeholders;
- Allocation of resources and identification of expertise (inside and outside of the organization) for achieving the learning analytics objectives;
- Undertake a robust formative and summative evaluation of the learning analytics initiative to further refine the overall implementation and organizational change process.

Conclusions

The field of learning analytics is generating growing interest in data and computer science as well as educational science, hence, becoming an important aspect of modern digital learning environments (Ifenthaler and Widanapathirana, 2014). Despite the high interest, the adoption of learning analytics at educational organizations requires capabilities not yet fully developed (Ifenthaler, 2017). For example, stakeholders seem to be overwhelmed with available data and cannot make use of it for supporting learning and teaching as well as educational decision-making (Papamitsiou et al., 2021).

International perspectives on adoption models (Nouri et al., 2019; Ifenthaler and Gibson, 2020) as well as on policy recommendations (Ifenthaler and Yau, 2019) may help to move the pioneering efforts on learning analytics forward. An international Delphi study identified four themes to be addressed by researcher, policymaker and practitioner dialogs (Ifenthaler et al., 2021): (1) Development of data literacy in all stakeholders, (2) Updating of guiding principles and policies of educational data, (3) Standards needed for ethical practices with data quality assurance, and (4) Flexible user-centered design for a variety of users of analytics, starting with learners and ensuring that learners and learning is not harmed.

At the same time, on-going rigorous research is needed focusing on the effectiveness of learning analytics systems, successful strategies of adopting learning analytics, and creating multi-institutional perspectives and international comparisons on the implementation of learning analytics systems.

To conclude, more educational data does not always mean better educational data. Learning analytics have obvious limitations, and data collected from personal and educational sources (can) have multiple meanings. Identifying the validity of learning analytics adoption processes and confirming sustainable benefits for learning-processes and improving learning environments will further encourage the adoption of learning analytics.

Overview

In higher education there are multiple classifications for stakeholders within the organization including faculty, staff, and students. When researching a college or university, most institutions start to distinguish themselves by sharing a multitude of defining numbers with the general public and their prospective student audience. A school profile or about page on an institutions' Website often hosts a list of these numerical divisions, for example the number of undergraduate and graduate students, the number of majors and minors offered, the number of graduate degree programs offered, if any, the student to faculty ratio, the retention and graduation rate, and the school's average class size. One of the most essential terms when considering admission and selection to a university is class size. The term class size is defined as serving two purposes: the number of students in an individual course, or the average number of students being taught in a specific educational system. Class size is also an instrumental measurement for a registrar's office to use for classroom management and creating sections for courses (Rooney, 2020).

Class size in relation to the American four-year residential college model also has two meanings: both the size of individual academic courses and the size of an incoming cohort of students (e.g., the freshman class) (Bettinger et al., 2017). Class size can be referred to when recruiting students into certain cohort models for scholarships, graduate programs, or early assurance programs to law school, medical school, etc. However, class size is a critical component to attracting prospective high school students to attend a specific institution. Class size also affects how admission officers craft an incoming cohort (Duffy and Goldberg, 2014). Class size is relevant to prospective college students, college rankings, admission offices, and institutional priorities.

To better distinguish each definition and usage of class size, the type, stakeholders, and definition of each variation of class size is defined, as seen in Table 1.

Table 1 Class size types and definitions.

<i>Class size type</i>	<i>Stakeholders</i>	<i>Definition</i>
Class size (academic)	Department-specific	Number of students in an individual course
Class size (comparative)	Rankings	Average number of students being taught in a specific educational system/institution
Class size (enrollment)	Admission office; scholarships, specific departments	Size of an incoming cohort of students or the total number of students enrolled at an institution
Class size (section)	Registrar's office; individual academic departments	A metric for dividing courses into smaller units for classroom management
Class size (selectivity)	Prospective students	An indicator of a university's dedication to undergraduate student teaching and mentorship, as well as the accessibility level of faculty

This chapter will examine the various meanings and definitions of the term class size as they relate to the admission office perspective, selectivity, recruitment, the campus visit, retention, transfer students, variations across institutions, disparities by country/socioeconomic status, costs, student success, registrar, pressures facing class size, and changing demographics in higher education.

Admission office perspective

Perhaps the first mention of class size (enrollment) occurs while high school students are progressing through their college choice process (Hossler and Palmer, 2008; Perna, 2006). In our rapidly changing economy and world, universities are quickly transforming and adopting business practices to attract students (Rossi, 2014; Slaughter and Rhoades, 2004). The college admission process is becoming a frenzy, as institutions of higher education seek to compete for students and increase their tuition revenues as the operating costs for higher education continue to rise (Borin, 2014) and state support for public universities drop (Baum et al., 2013). High school students receive an overwhelming amount of information geared to help them make decisions about their post-graduation plans. They collect brochures regarding four-year, two-year, and professional school options; high school students are also often subscribed to social media campaigns run by admission offices through blogs, Facebook, Twitter, and Instagram promoting day in the life campaigns, college tours, and college fairs (Gregory, 2014; Johnston, 2010). Mailings include college viewbooks, emails, letters, and packets that all promote the college admission process.

One of the first questions school counselors and family members ask a rising high school senior about attending college is regarding institution size and whether or not the student hopes to attend a small or large institution, to determine the student's ideal class size (enrollment) (Johnston, 2010). In the barrage of advertisements received, high school students are left to make meaning of institutions and their own potential interest in attending based on facts and figures regarding average class sizes (comparative) and student-to-faculty ratios (Borin, 2014). Many prospective students and families compare colleges and universities to determine their best academic fit based on these precise details regarding class size (comparative), both in the classroom and in their cohort (Mattern et al., 2010). Class size (comparative) is a factor in various ways regarding the admission process and selectivity of an institution; there are also variations in pressures that affect class size (enrollment) across different types of institutions (Hossler and Palmer, 2008).

Selectivity

The official reporting of class size (selectivity) is one of many factors that contribute to college rankings and ultimately impact the admission process (Kim, 2018). Given the importance of the college choice decision by students and the desire of selective institutions to maintain their reputation and rankings, college enrollment managers are paying increased attention to all elements of institutional communication that may influence applicants' decisions (Hossler and Palmer, 2008). Because students are applying to more schools on average than previously, it becomes even more challenging for colleges and universities to predict enrollment and thus accurately predict acceptance and yield numbers (Clinedinst and Koranteng, 2017). If acceptance numbers rise in a given year, the institution's selectivity rating will be affected in national rankings, which ultimately impacts the next year's prospective applicants due to changes in reputation of perceived selectivity (Clinedinst and Koranteng, 2017). For students seeking out a selective higher education institution, a dip in the rankings even by a few points may impact a student's perception of academic reputation, campus resources, and career prospects after graduation.

From this vantage point, class size (selectivity) is viewed as an indicator of a university's dedication to undergraduate student teaching, faculty/student mentorship, and accessibility of faculty members for office hours, research opportunities, and physical presence in the classroom. At institutions with larger average class sizes (academic) and fewer professors per student, many prospective students will assume a dependence on teaching assistants, an abundance of large and impersonal lecture hall classes, or an institutional-based emphasis and priority toward graduate level coursework/research (Duffy and Goldberg, 2014).

Recruitment

Class size (enrollment) is important when recruiting students into cohort models for merit scholarships or early assurance programs to graduate programs. Often times while the admission office may be looking to fill a larger class size (enrollment) for the incoming class of students that number can be divided even further into multiple sub-groups and populations. A merit scholarship office has the responsibility to fill one or multiple merit scholarship spaces with a certain number of students and varying demographic requirements. The admission and financial aid office often have one-off scholarships as well, often funded by donors with strict regulations, for example a student from a specific county or a student with a specific academic or extracurricular interest (Dynarski, 2004).

From the admission office perspective, class size (enrollment) is paramount in concern for building a balanced class and meeting the needs of a variety of institutional stakeholders (Borin, 2014). One of the many concerns for an institution is shaping a class that is well-suited for academic and personal success at the specific institution, yet also creating a group with a broad range of diverse

backgrounds and experiences (e.g., geographic diversity, racial/ethnic diversity, socio-economic status diversity, sexual/gender diversity, political diversity) to create globally engaged and informed citizens.

As a method of increasing yield among highly desirable students there may also be consideration for a small stipend, admission to the honors college, selection for gap year funding, or guaranteed/early admission to business school, medical school, or law school. The athletic and arts departments are also attempting to fill any open spots on their teams or within their departments. Some institutions also make use of recruitment of first-year students to study abroad or gap year programs to fill any potential gaps into the class size (enrollment) later. These students may come in as second-semester freshmen or sophomores to increase retention and graduation rates, despite other students withdrawing, leaving, or failing after the first semester. Often it is first-year housing that makes over-enrolling so complicated, so bringing in students to attend in-person a semester later or even come to campus as a sophomore gives colleges more options when building their class (Duffy and Goldberg, 2014). The making of a class also means the making of many sub-classes within that class. One shift here or there, or lack of yield in a certain area affects all stakeholders involved in the process.

The campus visit

While institutional characteristics such as size, location, prestige, cost, diversity, admission rate, and college rankings vary between colleges, each characteristic may influence students in making decisions about whether or not to visit, apply, or enroll in a specific institution (Perna, 2010). Regardless of whether or not a student is seeking a large or small school, the campus visit allows a student to experience what the size of the institution truly “feels” like (Okerson, 2016). Research investigated the role of habitus in addition to the role of community, campus, and policy makers on college choice (Perna, 2006). Students are seeking a sense of belonging, and the most influential part of the campus visit occurs on an individualized level (Perna, 2006). Students decide whether and where to attend college, but also decide what to study, whether to persist and graduate all based on the amount of human, financial, social, and cultural capital available to the student throughout their postsecondary educational experience (Perna, 2006). While high school students can read about the average class size (comparative) and student to faculty ratio, the campus visit allows a prospective student to evaluate that size first-hand in order to determine fit (Mattern et al., 2010).

Previous research has shown that the aesthetics of campus make a significant impact on a student’s decision of where to attend college, and within aesthetics is the size of the campus (Okerson, 2016). Size of the college campus was an important factor for students when deciding where to apply and how the students felt they connected to the campus once they visited (Okerson, 2016). Even though some students initially stated a preference for a smaller or larger college environment, most students applied to a mixture of sizes. During the campus tour, students seemed to have a better grasp of whether the size was a good fit for them or not (Okerson, 2016; Mattern et al., 2010).

While not all campus tours allow students to view a live class or classroom, colleges and universities often provide an experience for a prospective student to sit in on a class or shadow a current student for a day (Okerson, 2016). With COVID-19, the future of seeing a classroom in action is also in question, but it is critical as it allows prospective students to evaluate the academic rigor of an institution, engage and observe current students in the classroom, and evaluate the size of future academic classes through their own personal lens. The campus visit is essential for a prospective college student to better understand the size of an institution as well as get a glimpse of what their future class sizes (academic) would be on campus (Okerson, 2016).

Retention

Colleges and universities are often graded and ranked on metrics such as retention and graduation rates as measures of their success by stakeholders, policymakers, and accrediting boards (Millea et al., 2018). Incoming students and prospective families are interested in those numbers as a way to assess how many students are “happy” with the product of their college education. They assume that if the majority of students are happy, that their student will be as well. It is extremely difficult to replace students who leave before completing their degrees, and thus institutions are motivated to find ways to increase consumer happiness, occasionally through class size (academic) (Millea et al., 2018). Some universities limit and reduce class sizes (academic) to increase accountability for students to encourage them to attend classes, engage with professors, and participate in their college experience; it is also a helpful method for student affairs officers to identify students who may be falling through the cracks.

Research shows that students who have more shared experiences in common with other students through courses and student life programming are more likely to persist through their college experience (Sapelli and Illanes, 2016). And while large class sizes (academic) may not negatively impact a student’s grades, they can negatively impact a student’s level of satisfaction with their institution in addition to their final evaluation of their instructors/professors (Sapelli and Illanes, 2016). For many institutions that seek to increase their retention and graduation rates over time, class size (academic) is an important factor to consider investing in to improve student success and satisfaction, and ultimately their future number of graduates (Millea et al., 2018).

Transfer students

Retention and graduation rates go hand in hand with the idea of class size (enrollment) post-first year in college. As incoming first-year students admitted to a college or university finish their first year of study, many do not return. Whether a student transfers, takes a gap year, pursues a job or internship opportunity, or requires a medical leave of absence, each student that leaves the institution ultimately impacts class size (enrollment) for the institution (Glynn, 2019). Generally, the first-year cohort will always be the largest at the majority of institutions, as there is a new applicant pool to replenish it with each year, but it is challenging for four-year institutions to recruit and yield transfer students. Enrolling transfer students into a predetermined class size (enrollment) is yet another challenge as institutional size and type impact how many transfer students are accepted, how many in-state, out-of-state, or international students are admitted, and the amount of financial aid the institution can support.

For many years transfer students were looked to as an incentive and a way to replenish funding streams for the university (Taylor and Jain, 2017). Transfer student admission programs are rarely as robust or slick as the resources, time, and materials that go into recruiting first-year students and less time and attention are often dedicated to transfer orientation and success programs on college campuses (Glynn, 2019). Yet, transfer students are often a great method for an institution to bring in extra students to campus, who have demonstrated success in college-level courses and may have a more mature understanding of what they are seeking in their desired college fit. When transfer students transition well and are successful, they can also be instrumental in recruiting and connecting with prospective transfer students. Putting time and effort into recruiting transfer students and orienting them to campus is necessary for institutions trying to improve their graduation and retention rates. Transfer applicants are an essential component of understanding class size (enrollment) and the impact of retention in higher education.

Variations across types of institutions

Class size also varies depending on the context. Online universities will view class size (academic) using a different lens, as research shows class size (academic) has little impact in online settings (Bettinger et al., 2017). Students may choose to take online classes through their home institution or receive transfer credit toward their home institution. Community colleges are also known for typically having smaller academic class sizes (academic) across the board. Class size (academic) stipulations also vary widely in international sectors, based on whether higher education is viewed as a public good or a private benefit (Lambert, 2014). As a public good, class sizes (enrollment) are likely larger to accommodate more students, and their counterparts at expensive institutions that offer private benefits often tout small class sizes (academic) in addition to more attention and resources for students (Lambert, 2014).

Cohort and academic class sizes fluctuate at various institutions based on a number of factors including institution size. Class size (academic) differs by funding type (i.e., whether the institution is private or public, for-profit or non-profit), in addition to whether the institution is more narrowly or broadly focused (e.g., liberal arts focused or strictly engineering). Individual class sizes (academic) also vary due to the competitiveness of an institution, and the method of delivery. Colleges or universities who are more selective tend to have larger endowments and can afford additional faculty and additional class offerings to support smaller average class sizes (academic) and smaller faculty to student ratios (Rossi, 2014). In many ways, more competitive institutions must continue dedicating funds to ensure their individual class sizes (academic) remain the same in order to remain selective in the rankings.

Disparities by country/socioeconomic status

Another important distinction for class size (academic) is context. Class size (academic) varies by country and is also impacted by socioeconomic status (SES). In the United States, class size (academic) affects students' achievement and psychological well-being in relation to group composition (immigrant background, gender, SES, and achievement) and size (Alivernini et al., 2020). Students who come from a lower SES background have an elevated risk of lower levels of well-being and higher chances of developing psychosocial stress (Currie et al., 2012). Class size (academic) also has a significant impact on how a student feels about school (Rjosk et al., 2015). These risks make studying class size (academic) important to researchers around the world, as they desire to provide the greatest probabilities of academic success and positive mental health for all students.

Class size (academic) reduction is touted by many in the United States as a method of improving learning outcomes and behavior (Alivernini et al., 2020; Rjosk et al., 2015; Rossi, 2014), but a South African study chose to take on this research as it is a country whose considerably larger class sizes are found in low SES areas of the country (Köhler, 2022). In this study, there were 20 or more learners in the average classroom of the poorest public schools in the country (Köhler, 2022). But higher-class size in this study was not associated with negative learning outcomes in low SES areas; instead, negative learning outcomes were only found in wealthier schools with larger class sizes, which means other factors are distinctly at play (Köhler, 2022).

Flores-Mendoza et al. (2021) performed research in Argentina to study SES in the classroom and found significant ties between larger class sizes and low SES areas as they attempted to study the influence of a school's resources on a student's ability and academic performance. Ultimately this study found that individual differences, not SES variables were most at play for differences

in achievement (Flores-Mendoza et al., 2021). Artificial Intelligence allowed for the study of 110,627 students, to understand academic achievement in public high schools in a European Union County, and the study found that class size had no impact on academic achievement in that context (Cruz-Jesus et al., 2020).

Another study specifically analyzing European countries found Portugal as an outlier as it was the only country that does not see an impact on class size for students' reading scores; Croatia and Italy also stood out as the most important variable for math scores in both countries was class size (Bonacini et al., 2021). Overall, the study demonstrated that the gaps in test scores by county varied most due to the quality of the school, and by class size, rather than varying by social or economic status (Bonacini et al., 2021).

Context is extremely important in evaluating class size (academic), as each country, region, and school has a different environment that results in disparate academic achievement markers. Class size (academic) is affected by SES, school resources, and teacher quality. Even in studies of just one country, finding definitive answers on class size proved challenging. Continued research regarding class size and implications is needed in each specific context for researchers to better understand the phenomenon in their country, region, or continent.

Costs

Class size is also associated with cost for higher education. Institutions have to strike the right balance to provide for students and also invest for the future. While small class sizes (academic) have historically been revered in the United States, these same idyllic classes come with a hefty price tag. In relation to academic courses on campus the smaller the class size (academic), the higher the number of total courses offered has to be, which in turn means a department needs to hire and pay a greater number of instructors, and all of that adds up for an institution, especially if tenure is involved and the institution is research-focused (Baum et al., 2013). Each class size (academic) also comes with facility costs for heating and cooling lecture halls, classrooms, and labs. If class sizes (enrollment) are too large, institutions have capacity concerns. The economies of scale are influential for every institution. Finding the right balance of small classes where it matters in addition to larger class sizes (academic) allows institutions more flexibility and additional cost savings.

In admission, on the other hand, coming in short on the incoming class size (enrollment) means the possibility of not having enough tuition or revenue to support salaries, buildings, and existing programs on campus. Of course, many institutions utilize waitlists in order to combat summer melt and committed students withdrawing after being admitted to other institutions, and that can help to ensure the incoming class size (enrollment) is on target. The more selective a college or university is, the smaller the class size (enrollment) and student to faculty ratio. But often there are factors that are not within an admission director's control. If a nearby competing campus over enrolls that can impact enrollment for another institution.

During COVID-19, some students opted to take a year off from school to work or chose to enroll at local community colleges to receive college credits online for a fraction of the price of their home college or university. Many institutions are grappling with how to price online education to stay competitive in the academic market and still bring in enough revenue to keep their programs afloat (Baum et al., 2013; Bettinger et al., 2017). As the cost of higher education continues to rise, students and families struggle when considering which institution of higher education provides the best education, campus life, campus amenities, and location; however, these elements must be weighed against the total cost of that institution (Lambert, 2014).

Student success

Class size (academic) and student success have always been intertwined, as many have suggested that smaller class sizes (academic) indicate quality teaching, instruction, feedback, and learning and thus provide better avenues for demonstrating potential student success, but the accuracy of these claims is also often debated (Ake-Little et al., 2020; Kuh, 2008). While research advocates for small first-year seminars as a high-impact experience for students to gain critical thinking skills and develop intercultural competency, the research does not demonstrate that class size (academic) impacts future success or retention (Kuh, 2008).

Recent research from Temple University drew a robust sample size to test whether or not smaller class sizes (academic) accomplish the intended goal of greater student success (Ake-Little et al., 2020). Many limitations existed with previous research and did not control for instructor experience or attempt to ensure that race, gender, and academic disciplines were all factors being controlled for during previous studies (Ake-Little et al., 2020). But in this particular case, researchers looked at all factors across several years of general education courses to see if there is indeed a correlation between success and class size (academic) (Ake-Little et al., 2020).

The results indicated that class size (academic) effects are much more nuanced than previously imagined. While instructors may prefer smaller class sizes (academic) because it allows them to get to know their student's better and use a larger variety of pedagogical tools, not all learning occurs within the classroom itself, and thus the researchers propose that social group theory, and the impact of a student's peers also is a factor of the impact of class size (academic) (Ake-Little et al., 2020; Sapelli and Illanes, 2016). When examining both race and gender there are also distinct nuances regarding impact that shift based on the academic discipline (Ake-Little et al., 2020). Surprisingly no student group seemed to be affected negatively or positively by large class sizes (academic) (Ake-Little et al., 2020). The researchers go on to explain that in a larger class, an instructor must shift the assignments and objectives based on the size of the classroom and thus the experience and expectations are different in larger class size

(academic) sections of a course (Ake-Little et al., 2020). But one limitation of the research is that the researchers used student grades as the measurement output of student success, which while it is a comparable piece of data from every class regardless of class size (academic), it does not always accurately measure student success or student learning. Also, there is not research to indicate the balance of varying class sizes (academic) in a student's course load. But class size (academic) is not dictated solely by the institution itself, as accreditation bodies also examine class size (academic) as a method of reviewing academic quality and standards.

Registrar

The primary role of a university registrar is to maintain course records and student data. Often this includes tasks like scheduling space and time for class, maintaining course catalogs, managing registration, directing curriculum management, and fulfilling transcript requests (Rooney, 2020). Registrars are closely aligned with class size (section) as they are constantly dealing with the question of increasing capacity without affecting academic integrity. Especially during the COVID-19 pandemic, university registrars have had to reimagine and attend to best practices for online class sizes (section) (Rooney, 2020). They also have to assess the data after the fact, examining how many students withdrew from the course, the distribution of grades, and the course evaluations to determine if the ratio of students to instructor were on or off for a particular course. Registrars are constantly examining the idea of ideal class size (section) for different types of courses, departments, and college-level students to find the right balance to enhance student success and the overall academic experience on campus (Rooney, 2020).

Pressures affecting class size

Institutions are concerned with bringing students together who have different academic and extracurricular interests. The challenge for admission offices is to balance external pressures for funding and rankings with institutional needs and relationships with on-campus partners (e.g., President/Provost's office, athletics, arts departments, university advancement) in order to define the incoming class size (enrollment). There is often a great deal of pressure from the university administration to finish the admission cycle with a very specific target. As most universities are highly dependent on tuition revenues, meeting enrollment targets is critical. This precise number depends on admission using prediction models based on previous admission cycles and an analysis of the decision-making of prospective students. A higher number of incoming students can negatively impact housing availability in addition to student happiness and retention. A lower number of incoming students affects the institution's budget. Many offices and resources on campus depend on a specific target number being met.

In order to maintain control over size, many colleges and universities utilize a waitlist as a method of managing these precise targets. By enrolling just under the number of students desired in the next incoming class, a strategic admission office is able to fill the spots one by one with candidates off of the waitlist to end up at their precise target without over-enrolling. When an institution increases their class size (enrollment) for the next incoming year, prediction models often fail, and many institutions may over or under enroll at a significant rate.

Changing demographics

High school class sizes (enrollment) are another element impacting the future of higher education today, as changing demographics will make filling classrooms and cohorts even more difficult as we look into the future (Grawe, 2018). Forecasters suggest a significant drop in the number of high school graduates based on birth rates affected by the economic downturn in 2008 (Grawe, 2018). Also, in the years to come there will be important differences in the makeup of the college-going population with an expected boom of first-generation, underrepresented, and rural students (Grawe, 2018).

Many colleges and universities are working now to attract non-traditional adult learners to their programs. Institutions are expanding online education opportunities that they discovered helped to increase access during the COVID-19 pandemic, increasing outreach to different parts of the country, focusing on diversity, and being intentional about outreach to first-generation underrepresented students (Grawe, 2018). These changing demographics require admission offices and marketing staff adjust strategies, plan for the future, and be creative in new ways to attract students to apply and enroll in order to adapt their class sizes (enrollment) to the changing demographics of the United States (Grawe, 2018).

Final thoughts

Class size is a critical element of higher education to be understood through the lens of prospective students, admission officers, and institutional stakeholders. It is not just the number of students in one particular academic class or cohort; it is also the framing of what the community is for a particular college or university. The number of students in a particular environment and the representation of inclusion among various types of diversity on campus within that number are critical for many prospective students, as well as for the staff and faculty. The definitions and the context in this chapter provide additional context on the study and

implications of class size for various stakeholders in higher education. Class size is important to understand when evaluating admission and enrollment, the role of the registrar, and the reputation and accreditation of an institution. For many institutions, much is at stake in the decisions that drive both the number of students on campus, in cohorts, and in class years in addition to those pre-determined class sizes (academic) and offerings.

Introduction

Most universities throughout international higher education offer alternative arrangements for earning college credit outside of classrooms. Three popular mechanisms for awarding and documenting that learning are credit for experience, credit from recognition, and transfer credit. Faculty members award credit for experience when they are convinced that a student has engaged in meaningful educational experiences that were similar to or equivalent to the curricular pathway offered through formal matriculation. An example might be the owner of a printing company who returns to college to complete a degree in small business management. The institution might be inclined to award the student credit for life experiences that the student already navigated as a small business owner. The second mechanism for awarding credit for learning that occurs outside a formal curriculum is credit recognition. Several agencies and organizations measure learning experiences and competencies outside of a college credit matriculation regime. Sometimes universities recognize those learning opportunities and credential them as such. The final alternative credit mechanism is transferring credits earned at another University or country to a destination university.

Credit hours

Universities afford students the opportunity to learn curriculum that teaches them general knowledge, marketable skills, and the opportunity to signal to employers that they are qualified and ready for work in their organizations (Tomlinson, 2018). Typically, progress and completion of a path of matriculation to a degree or certificate is measured by the completion of credit hours (Prashun, 2014). The modern credit hour evolved from a desire on the part of universities across North America to standardize high school curriculums in “Latin, history, or algebra” (National Education Association, 1894, p. 17). Some educational historians have used different years to mark the different periods of the maturation of the credit hour (Prashun, 2014). However, at least two significant writings agree that around 1870 through the early 1900s colleges and universities around the United States were dissatisfied with the dramatically uneven college preparation of incoming first-year students. These recent high school graduates had inconsistent preparation for their collegiate studies. This uneven preparation was a source of considerable dissatisfaction for both students and faculty alike. In 1906 the Carnegie Foundation was established. By 1909, the Carnegie Foundation had built on work accomplished by various accrediting agencies. Further, the provision of a potential monthly pension for teachers by the Carnegie Foundation provided encouragement for high schools and colleges to use the Carnegie Unit to measure high school time on task and as a potential unit to measure how much instruction a potential college student received. Both high schools and colleges throughout much of the United States adopted the Carnegie unit to describe, contrast, and compare high school instruction was widely adopted by 1910 (Prashun, 2014). This period from 1895 through 1920 is defined by some educational historians as the age of “standards”, due to

the fact that so many uncertain and unstandardized variables were coordinated and clarified during this period (Hawkins, 1997). Interested readers are encouraged to consult Hawkins for a more detailed sequence of events, including organizations, motivations, and their leaders.

Out of the age of “standards” arose the widespread adoption of the “credit hour”. Universities attempted to formalize work assignments, course work, and semester duration. The “credit hour” sought to ensure that every college graduate engaged in 60 year-long credits. The formalization of two semesters (fall and spring) led to the breaking down of the 60 year-long credits to 120 semester-long credits (Shedd, 2003). The credit hour continues to factor heavily in discussions of the future of higher education both in the United States and throughout much of the world. Discussion of transferability, international access, globalization of higher education, student choice, and the difference between competency-based and credit-hour based matriculation are great examples of how the credit hour continues to shape the educational landscape. In fact, most of the alternative credit awarding systems below exist as an attempt to demonstrate an equivalence to the North American credit hour system.

Credit for experience

The United States Department of Education asserts that, students should beware institutions that seek to offer a degree based solely or mostly on life experience. Legitimate institutions offering “credit for life experience” use a combination of methods to determine how much credit to award. Those methods include examining the results of standardized tests, a prior learning portfolio of work examples, oral exams, past college credit, and professional certifications. While this information assumes a context within the United States, many universities worldwide describe their processes in similar terms. The US Department of Education urges caution from students when engaging with diploma mills who award credit for experience without also using any of the above listed methods. Most reputable universities award some credit for experience. No reputable university would award an entire degree, or most of a degree, based on previous experiences without the demonstration of additional credentials.

Independent study

Faculty members occasionally or frequently teach students with independent studies. These types of courses take many forms. Students engage in extensive study or designed experiences. The students are then asked to write and/or speak about their study, experience, or work. Increasingly these courses are used in service learning, community engagement, home-schooled students, and for other high school students who want to complete learning outside of the formal curriculum (Rafoth, 2003). Over the years independent study at various universities has included the preceding types of experiential courses, as well as more traditional internships, directed readings, honor’s scholar course projects, and thesis or dissertation hours.

Work experience

If a student has worked in an industry or held managerial positions, then that student maybe awarded credit for certain aspects of their “work experience”. These arrangements are increasingly rare. The development and wide-spread availability of tests and standardized curriculum means that students are more routinely awarded credit because they are able to demonstrate a competency, not because they worked in a certain position for a length of time. A student is much more likely to earn college credit by successfully completing the final exam for a marketing course and demonstrating work examples in a portfolio than by being awarded the credit simply because they managed some marketing functions at their previous job. Most universities will award a small number of credits for introductory courses if they award any credit for work experience at all.

Portfolio demonstration

Students can also use a portfolio to demonstrate that previous course work, life experiences, or work experience deserve evaluation for credit. Obviously, a portfolio with tangible or virtual examples makes discussing previous work products easier. Portfolio demonstrations are often required as part of a “creative” degree pathway in art, dance, or painting. Portfolios are often occasionally required for job placement in coding, graphic design, and video production or editing. When students are seeking credit for work accomplished outside of traditional learning pathways, a portfolio can provide examples of work product.

Credit recognition

Many higher education institutions are offering more non-credit adult courses. Some examples of non-credit bearing courses are high school equivalency courses, co-parenting classes for divorcing parents, non-academic certificates and micro-credentials (e.g., badges) in areas like web page development, floral design, phone application development, or safety courses. These types of courses may or may not involve some element of the university’s community outreach.

These courses encompass broad areas of interest and are often associated with community relevance in assisting life-long learners. These types of courses are often much shorter than traditional academic semester or even trimesters. Additionally, the course maybe designed for the primary purpose of transmitting information via video or text without much student assessment or with limited generative assignments. Examples of such courses are the University of Oklahoma’s “Chemistry of Beer”, The University of Madrid’s Calligraphy “The Geography of the stroke” course, or the University of Tasmania’s “Understanding Multiple Sclerosis” course. Much of this non-credit bearing, community-oriented, life-long learning is happening within Massively Open Online Courses or MOOCs. While most of the preceding courses are not typically offered for credit, they are representative of an alternative

educational resource available to students free of charge. These courses are tracked and occasionally certificates of completion are issued, but these courses are rarely if ever treated as equivalent to on-site learning offered at reputable institutions. Many of these classes are more oriented to community service and engagement rather than transcript-eligible credit bearing courses. While there are multiple instances of MOOCs that are taught for college credit (Stone, 2016), those arrangements are increasing rapidly through mechanisms such as the European MOOC Consortium, co-funded by the EU, and Open Universities of Australia. For nations and universities willing to cooperate the opportunity to recognize the education and instruction happening at other universities grows exponentially each day. Some well-recognized examples of credit recognition are briefly summarized below.

Cambridge International Examinations

According to the Cambridge Assessment website, Cambridge International Examinations is a subsidiary of Cambridge University Press and Assessment. The organization claims to be the 'largest provider of international education programmes and qualifications for 5–19 years'. The aforementioned "credit hour" problem and lack of primary and secondary school standardization was handled differently by the faculty and Cambridge. Rather than creating a standardized curriculum at the K-12 level, the faculty at Cambridge set standards for admission and empaneled a group of local examiners to qualify students seeking admission. In 1858, 370 school candidates sat for the examine. Today, over 8 million candidates in 160 countries have sought endorsement of their learning through Cambridge examinations and assessments.

Excelsior College exams

Excelsior College was founded in 1971 by the New York State Board of Regents. The College was originally formed as the Regents External Degree Program with generous grants from the Ford Foundation and the Carnegie Corporation. In 1998 the College reorganized as a private, non-profit, independent institution. In 2001, Regents College changed its name to Excelsior College. During the institution's affiliation with the New York State system for higher education the College provided high quality independent studies and correspondence courses to working and/or place bound adults. Excelsior College provides online and correspondence options for earning college credit in over 55 different courses. Further Excelsior College offers a distance-based independent study in nursing. Excelsior College provides Applied Associates through Master's degrees in nursing. All students graduating from these courses are still subject to state and national accreditation examines such as NCLEX. Certain components of advanced nursing courses require in-person or web-proctored demonstration of skills by the students.

Completion of other learning opportunities

The American Council of Education (ACE) is a trade/service organization that represents the university presidents of member institutions. ACE reviews a variety of educational opportunities provided outside of formal university matriculation pathways and recommends how academic departments and university registrars should regard those learning opportunities. A cursory examination of ACE's "National Guide" reveals a wide array of educational experiences for which ACE recommends college credit. The National Guide is produced with input from faculty members or former faculty members. The National Guide shows five different pathways for credit recommendations: for colleges and universities, for learners, and for training providers, for apprenticeships, and for the military. Each pathway engages different types of learning and different recommendations for earning college credit through that pathway. ACE is specific to education provided in the United States and in a US context. However, because many non-U.S. residents are trained by the military, at colleges and universities, and through corporate learning opportunities, ACE credit recommendations potentially impact learners world-wide. The ACE refers to some of those sources include trainings conducted by the United States military, corporate trainings, executive leadership programs.

Non-credit adult classes

Over 220 million learners world-wide have participated in at least one Massively Open Online Course or MOOC. These non-credit adult education classes are offered for free through various national and international providers. Two of the top three MOOC providers are based in the US Coursera and EdX. The third is FutureLearn, which is based in the UK. More than 950 colleges and universities have participated in or taught a MOOC. To date, around 1500 learners have earned micro-credentials and around 70 learners have earned actual degrees through these "non-credit" course pathways. The overwhelming majority of content available on MOOCs is for free and doesn't involve any formal credentialing of learning. Micro-credentials and formal degrees are akin to "in-app" purchases. The course content exists as an application. To upgrade for credit or for faculty evaluation and faculty directed and supervised assessment, then the student must upgrade to receive a higher level of service and credentials. MOOCs are a part of internationalization and are because they operate internationally they are helping to accelerate trends toward internationalization and harmonization of education (Stallivieri and Boal, 2015).

Transfer credit

Transfer credit remains the most recognized and dependable method of porting credits from one college or program to another. Transfer credit arrangements are either predicated on a shared expectation of contact and teaching hours, rigor, and content or on shared outcome based competencies. Typically, transfer credit has been predicated on the credit hour. College and universities granted credits to transfer students based on recognizing courses already completed by the student. Students earned full or partial credit in furtherance of their degree program based on course work completed at other educational institutions. Increasingly,

colleges and universities are attempting to coordinate with other universities in their country and throughout their continents. The General Agreement of Trade and Tariffs 2003 trade negotiations focused on portability of education. Out of those negotiations sprang the Bologna Process. The Bologna Process is explained in more detail in the next section.

Europe

In 1987 the European Union formed the Erasmus program to enable the mobility of students throughout Europe (Roper, 2007). The program used bilateral and institution to institution contracts to allow 'study abroad' educational opportunities to appear on transcripts as credit counted toward graduation (Froment, 2003). The Erasmus program was replaced by Erasmus University Charter in 2003. Erasmus membership entitles participating European Universities to secure funding that assists in harmonization of content, standards, and assessments across multiple institutions. As of 2021, the efforts of these universities have enabled more than 9 million people to seek instruction at different universities. In addition to serving the needs of millions of Europeans, the Erasmus program has served as a functional model upon which additional programs and efforts to support international harmonization have been based (Roper, 2007).

In 1992 a 6-year pilot program called the European Credit Transfer System was created (ECTS). The ECTS was a project of the Erasmus program. The ECTS adopted a credit-based system that focuses on required workloads to achieve objectives, learning outcomes achieved, and competencies to be developed. The ECTS is based on students earning 60 credits for full-time enrollment in a typical academic year. The ECTS credit system counts time on task away from class. The US credit system counts contact hours between professor and student. The ECTS count all time on task to achieve a certain level of knowledge or proficiency (de Wit, 2007).

Bologna Declaration/Process was signed June 19, 1999. The Bologna Declaration is primarily a European document but does include non-European members. The principle undergirding the Process is that the best way to ensure credit transferability and portability throughout the European Union was to standardize the duration of academic terms and encouraging similar curriculum. Each of these different components have been adopted by signatory nations. Some nations have done more to implement the accord than others. Many European Union accords and or processes are driven more by the EU or by implementing supra-national agencies; however, the Bologna Process is meant to be a standardization that is encouraged by common deadlines and objectives and less by penalties and restrictions (Westerheijden, 2003).

The Bologna process involves four parts. First, signatory nations are to adopt a 3-2-3 structured system. All units assume academic years. The 3-2-3 system means that European students should be able to earn a bachelor's degree in 3 years; a Master's degree in 2 years; and a doctorate in 3 years. Theoretically, up to 80% of the courses and curriculum would be transferable and portable across all of the European Higher Education Area. Second, the Process will further define for employers what type of degree is needed for a specific occupation. Does that job involve understanding and skills that are more associated with a bachelor or master's degree? Third, the Process will rely heavily upon the European Credit Transfer System to encourage and enable transferability of credits and portability of completed degrees. Fourth, the process encourages transnational cooperation in quality assurance (Roper, 2007).

In addition to the Bologna Process, the Erasmus program, and ECTS, Europe also boasts OpenUpEd. Formed in 2013 as a response to for-profit Massively Open Online Courses provider Coursera, OpenUpEd is a not-for-profit European consortium of Open Universities (Schuwer et al., 2015). Because OpenUpEd is affiliated with and provides a service for a number of European universities, the credit earned on OpenUpEd can be more easily transported to universities in other European countries (de Langen, 2018). The curriculum is designed with an international consumption in mind (van Dijck and Poell, 2015). This consortium also involves partnerships with other universities that are not officially considered Open. OpenUpEd now includes almost 20 partner and affiliate universities throughout Europe, and a handful of universities in North America, Africa, and the Middle East as partners (OpenUpEd "Partners", 2022). OpenUpEd is sponsored and hosted by funds from The European Association of Distance Teaching Universities. Europe's efforts at harmonization have served as a model for other continents (Schuwer et al., 2015; van Dijck and Poell, 2015).

Asia/Pacific

Educational harmonization efforts in Asia date back to 1994. Three different credit transfer evaluation and portability systems emerged since that time. University Mobility Asia was an international consortium of governments and universities. This system was largely limited as was not participated in widely. In 2008, the second system developed from a group called "Asia Cooperation Dialog". That consortium involved 18 countries from East Asia, Southeast Asia, South Asia, and the Middle East (Asia Minor). This group was inspired by the success of the ECTS. They proposed an Asian Credit Transfer System. Finally, in 2009 the Association of Southeast Asian Nations put forth the ASEAN Credit Transfer System, now referred to as the AUN-ACTS (Asian University Network—Asian Credit Transfer System (Hotta, 2020).

Each of these three systems involves different scope, signatories, members, and sponsorship. Japan is included in the ASEAN group. Notably, Japan, South Korea, and China account for more than 3000 of Asia's 7800 institutions of higher education. Many regional solutions that fail to include any one of these countries remain partial and incomplete. Beginning in 1997 the ASEAN community began creating organizations that include China, Japan and South Korea, in the "ASEAN Plus Three" framework. Asia's efforts at harmonization have been directed to making study at other Asian universities more attractive and profitable. Asia's educational harmonization efforts have yet to address inconsistent durations of terms and variable definitions of credit hour/contact hours across different countries. The duration of terms varies across Asia with China preferring 17 week terms and Laos using

13 week terms. Recently the ASEAN Credit Transfer System has been focused on articulating with the EU and the ECTS. ASEAN Plus Six efforts include China, Japan, South Korea, Australia, India, and New Zealand. Some educational theorists believe that the ASEAN Plus Six service area is too large, unwieldy, and culturally diverse to be effectively harmonized (Hawkins, 2012).

Australia

Australia remains a destination for international students. The fact that the instruction is in English and Australian Universities have a good reputation internationally encourages students to study at Australian universities (Hotta, 2020). Australia has done much to harmonize its own educational offerings in the past decade. Much of that consolidation has been accomplished with Open Universities and Open2Study. Open2Study was a catchall consortium for Open Universities Australia. Open Universities of Australia now provides Massively Open Online Courses from one clearinghouse of Australian MOOCs. These courses are sponsored by 21 different Australian universities and provide a tremendous amount of flexibility and portability for their students.

In 2021, Australia reaffirmed its integration with ASEAN by signing a comprehensive trade and cooperation framework. Additionally in 2020, Australia formalized member in ASEAN's Regional Comprehensive Economic Partnership. This free trade agreement includes ASEAN member nations plus China, Japan, South Korea, and Australia. The signatories to this free trade agreement account for 30% of global population and 30% of global gross domestic product. Theoretically, Australia's multiple levels of strategic partnership with ASEAN lays the groundwork for an Australia system of higher education that is more harmonized with Asia than any other region. Australian higher education frequently attracts many students from throughout Asia. Australia has also cooperated with universities in China and Japan to create "twin" campuses in both those countries (Yenchken et al., 2021).

Africa

Efforts at higher educational harmonization in Africa have a long, rich history and are ongoing (Woldegiorgis, 2017). Some scholars assert that 'harmonization' in Africa is often used interchangeably with "regionalization" (Knight, 2017). Colonial rule, uneven national educational systems, inconsistent educational opportunities, and linguistic diversity are all challenges to educational harmonization efforts in Africa. Higher levels of priority to harmonize educational systems between and among neighboring and/or friendly Africa states dates back to the post-colonial era of the early 1960s (Mazrui, 1980). A second era of robust harmonization followed the changing of the Organization for African Unity (OAU) into the African Union (Woldegiorgis, 2017). The first intergovernmental conference of African Ministers of Education was held in Ethiopia in 1961. The conference was well attended by governments and nongovernmental agencies. The Ministers crafted and endorsed the Educational Development Plan, a 20-year plan to improve education on the continent. The plan also set practical goals to increasing intra-African educational cooperation, providing a higher education for up to 20% of Africa's high school graduates, and producing more primary and secondary teachers (Woldegiorgis, 2017). Africa produced almost 300,000 teachers in the following 15 years. The following year in Madagascar, the second intergovernmental dialogue was held in September of 1962. This meeting focused on higher education in Africa. The primary emphasis following this conference was on decolonization of the African university and producing a system of higher education that worked for Africans rather than recreating or perpetuating the university systems of western colonizers (Knight and Woldegiorgis, 2017). In 1967, Africa's Education Ministers created the Association of African Universities, the AAU. The AAU would become an important organization promoting African educational harmonization. In 1981 at the Intergovernmental Education Ministers meeting in Arusha Tanzania, the Ministers agreed to a UNESCO recommendation to adopt a "credit transfer" system. Sadly, despite over 20 African countries signing the accord, as of 2016, no country has ratified the Arusha credit transfer accord. Article 2 of the legal instrument articulates criteria for portability of certificates, credits, degrees, and diplomas (Woldegiorgis, 2017). The African Ministers expressed strong agreement with the proposed framework. The Arusha Accords remain salient in discussions of African educational harmonization. The Accords has been revised at least six times since the beginning of the 21st century. The African Education Ministers had another watershed meeting in 1982 in Zimbabwe in 1982. The result of this meeting was an acknowledgment that despite the a nine-fold increase in attendance at African universities and enthusiastic agreement among national Ministers of education, that little actual educational cooperation had yet to occur (Woldegiorgis, 2017). At this meeting the Ministers endorsed a framework of "regional" cooperation that still resonates throughout many African efforts at educational harmonization. Cooperation with close neighbors was considered more culturally, linguistically, and practically effective. Sharing information, creating educational exchanges, and close cooperation is easier with immediate neighbors. Africa has rich linguistic diversity. Linguists estimate that there are 1500–2000 African languages (Heine and Heine, 2000). The linguistic differences between to neighboring countries are less challenging to overcome than the linguistic differences of two countries on different sides of a continent (Woldegiorgis, 2017).

The second robust effort at educational harmonization occurred after the formation of the African Union in the post-2000 era. The primary stated purpose of the OAU was to decolonize African political governance and to eliminate residual forms of imperialism that diminished self-determination and freedom of Africans. The OAU transformed into the African Union (AU) in July of 2002. The AU is primarily interested in creating a more comprehensive unity including economic trade, competitiveness with the global economy, and creation of knowledge-based economies, and creation of African Economic Areas (Adejo, 2001). One of the central organizing principles of the AU is promotion of education. The African Union created a program to establish and support the development of partnerships in Africa called the New Partnership for Africa's Development (NEPAD). NEPAD has set strategic priorities and designated some universities as centers for excellence in certain disciplines. NEPAD has worked to facilitate exchanges and cooperation among bilateral partners. NEPAD has worked to improve access to internet communication technology. Despite significant meeting and communication, most AU and NEPAD harmonization efforts have not been

fully implemented and remain conceptual with little actual cooperation and sharing to date (Woldergiorgis, 2017). Some scholars and administrators alike are calling for an African Secretariat of MOOCs to help with harmonization efforts (Oyo and Kalema, 2014).

Central, South, and Latin America

Harmonization initiatives throughout Central, South, and Latin America are proceeding similarly to efforts in both Africa and Europe. While harmonization with other providers in the Americas remains underdeveloped, some universities are robustly cooperating in exchange and credit transfer arrangements with universities throughout the United States and Europe. Prior to the 1990s most Central and South American universities were state chartered and sponsored educational institutions. Economic structural adjustment regimens undertaken at the behest of the World Bank and International Monetary Fund gripped most of Latin America in the 1970, 1980s and 1990s. Those developments coupled with the United States abandoning the “gold standard” in the early 1970s lead to a time of extreme governmental spending austerity. As a result of decreased spending, many Latin American universities struggled with inadequate funding (Noel, 2009). Subsequently, most new universities chartered in Latin America since the early 1990s have been private institutions (Teodoro, 2015). Many of those private college were religiously affiliated. In recent years, many of those newer universities have been criticized for inconsistent learning and a lack of rigor. Compared to each of the other continents and/or regions discussed here, Latin America has the least amount of resources devoted to research. Individual universities throughout Latin America appear to have more connections to the European Common Educational Area than to other universities in Latin America.

Despite resource limitations, Central, South and Latin America are proceeding with regional harmonization and in cooperation with the European countries. One significant cooperative development is the launch of the Alfa Puentes. Alfa Puentes was a digital platform that provides a public portal for interface with the public and general public, a closed Intranet for internal collaboration between users, mini-sites and pages for the organization of events and special projects. The Alfa Puentes site was a three-year long pilot project to jump start academic cooperation between Latin America and Europe (Clark, 2014). The site also hosted on-board support for multi-languages. The three languages supported by the site were English, Spanish, and Portuguese. Professors in Central America shared syllabi, a degree sheets, proposed course descriptions, a reading lists, assignments, and course content on the site. Group members were able to evaluate policies, share documents, and engage in textual communication with collaborators. The site has six formal partners in Europe, including the EUA, and man partners throughout Latin American. The sunset and concluding reports of the cooperative efforts are available for review.

Several other attempts at regional credit harmonization, regional assumptions for quality assurance and shared criteria for faculty qualifications have been attempted throughout Central, South, and Latin America for the past 35 years (Noel, 2009). The Adean Community, Mercosur, and the Ibero-American Network for the Accreditation and Quality of Higher Education are prominent examples. Initiatives aligned with or cooperating with the EU or UNESCO appear to produce the most results and/or demonstrate the most staying power.

Finally, while regional harmonization is less robust in Central, South, and Latin America, bilateral agreements and cooperation is comparatively more developed. As much as 20% of Central America’s scientific investment is provided by bilateral cooperative agreement with other countries (Svenson, 2013).

North America

From a credit harmonization perspective North America does will continue to be a destination country with as many as 130,000 international students expected to study at universities in the United States by the year 2025 (Macgregor et al., 2017). The top exporter of students to North America is still China. However, after 2025, India is projected to be the largest source of international students. Canada also attracts a large number of students from China, Australia, and France. Canada is the second largest destination market. Canada is the preferred destination of several countries for post-bachelor’s graduate studies (Yencken et al., 2021).

Universities within the United States continue to harmonize with one another and cooperate vigorously with other campuses on other continents, especially in China, Europe, and Latin America. This “twin” campus phenomenon has gained momentum. This arrangement accurately describes the international cooperation between several North American universities and their Chinese “twin” counterpart campus. Credits earned at one institution typically transfer to the other. Recruiting for faculty takes place primarily in North America. Scores of Chinese universities have direct bilateral affiliations with American universities.

Conclusion

Students in both national, regional, and international contexts have many opportunities to earn college credit through extra-institutional arrangements and through credit transfer. The Bologna Declaration and the development of so many designated Higher Education Areas throughout Europe, Asia, Africa, and Latin America are important watersheds in the mobility of student credit transfer regimes. Because ethnic, cultural, and geographic diversity add richness of experience to all educational pursuits, there is little doubt that transnational cooperation agreements, designated cooperation areas, MOOCs, and the desire to create greater potential for mobility within Higher Education will shape how and where students learn in the future.

Introduction

Curriculum reform, which began in the late 1960s as a systemic change method, targets both subject integration and classroom pedagogy in higher education systems. In Africa, the decolonization of the higher education curriculum, described as opposing domination of the curriculum in which a particular knowledge paradigm exists and is perpetuated, has been widely discussed in the broader literature (Cebekhulu et al., 2006, p. 88; Etieyibo, 2016, p. 404; Masaka, 2019). To interrupt this practice, it is necessary to acknowledge and accept there are competent and authentic knowers and knowledge elsewhere that exists beyond the dominant perspective, in which the traditional curriculum is saturated (Keet, 2014, p. 25). This dominant ideology leads to the attainment of epistemic justice. On the contrary, epistemic injustice is a result of doubting persons to be reliable knowers, which is typically done on prejudicial grounds (Masaka, 2019). Masaka (2019) presents the argument of epistemic justice which ought to surpass the parameter which leads the way in awakening agency of learners in how they contribute to the determination of their own destiny. In Africa, it is suggested that higher education has suffered so much that it surpasses the notion of exclusion of the indigenous people's knowledge paradigms which could be used in responding to prevailing circumstances (Masaka, 2019).

The topics of curriculum change took dimensions of colonization, decolonization, neoliberalism, and black studies in higher education in West Asia, North Africa, and Tunisia (Mullin, 2018). In relation to neoliberal policy, Uganda like many other countries has reformed its curriculum focusing on what students learn and this approach is mainly based on the outcome of knowledge (Alti-nyelken, 2010). The outcome-based approach to curriculum reform has failed learners in Africa (Gumede and Biyase, 2016) because it ignored both the process and contexts in the curriculum transformation processes. Chigbu et al. (2017) evaluated land governance degree programs in universities in Botswana, Ghana, Nigeria, Rwanda, Kenya, Mauritius, Uganda, Namibia, South Africa, and Tanzania and found capacity building as the key to achieving curricular reform in Africa. The capacity building perhaps has helped many Chinese and Asian universities recently to internationalize their higher education curriculum to be among the top universities in the world compared to Latin American universities (Zezele, 2012). Aside from capacity building, the internationalization of higher education curriculum and curriculum reform should fit into the contexts and address issues of epistemic injustice.

A more substantive transformation and decolonization of the higher education curriculum in Africa, for example, ought to go further, to focus on empowering the learners to take a lead in offering solutions to the problems and challenges that countries in Africa face. This means that the mere recognition and acceptance of previously unacknowledged epistemological paradigms—such as that of the indigenous people of Africa—into the epistemological canon are a necessary step to epistemic justice, but not the ultimate goal. Restoration of epistemic status to the paradigms that have previously been considered as lacking epistemic credibility may not lead to authentic epistemic justice (Masaka, 2019). This new curriculum was to be student centered and focused with an emphasis on an investment of students in their learning, instilling a sense of “full, shared ownership” of the curriculum through “respectful, thoughtful, and open-minded listening” (Kuh, 2001). The basic tenets of the new curriculum were connection and infusion. For instance, the history of curriculum changes in South Africa and Germany is different because of the different social issues that the reforms targeted (Chisholm, 2015). In South Africa and the United States, the focus of curriculum change was to address issues of racism, inequality, and epistemic injustice in Historically Black and White Institutions or Universities (Luckett and Shay, 2020). The critical question for Germany is whether the curriculum reform that has taken place between 1990 and 2010 has been able to redress the inequality of the Nazi racial curriculum that taught racism in schools and fostered hatred for Jewish, for instance. For African and Historically Black Universities and Colleges in the United States, the reforms are expected to recognize ways of knowing for different minority and racial groups.

In this chapter, curriculum reform is defined as the process of developing new courses and curricula across all disciplines based on a critical analysis of existing knowledge on various intersecting identities, such as racism, class, gender, disability, religion, sexual orientation, gender expression, and nationality (Schmitz, 2012). There is idea that the new curriculum should place gender and

diversity at the core of the academic program by integrating race, ethnicity, gender, and sexuality into existing courses (Kuh, 2001). Higher education should be exploring the multitude of barriers that are counterproductive to student success and are actively exploring effective strategies to overcome these challenges (Chitiga et al., 2019). As a result of the challenge, a new curriculum was explained in the context of higher education and within the decolonial intersectionality framework.

Decolonial intersectionality

The work discussed in this chapter is grounded in the theoretical framework of decolonial intersectionality. Intersectionality is grounded in the Black Women Feminist Movement and discusses and serves as a key paradigm for the analyses of identity, oppression, and privilege. According to many scholars and researchers, intersectionality has its roots in the Combahee River Statement of 1977 and Kimberlé Crenshaw's analysis of structural and political dimensions of intersectional oppression (Harris and Watson-Vandiver, 2020). The Combahee River Statement is an essay that was written by Black feminists that challenged the White feminism and the Civil Rights Movements as they did not see themselves reflected in those struggles, and as a result, did not promote the liberation of Black women (Harris and Watson-Vandiver, 2020). In the Combahee River Statement of 1977, the collective of Black feminists identified Black feminism as the "logical political movement to combat the manifold and simultaneous oppressions that all women of color face" (p. 264).

Within the "colonial curriculum," there lies the presence of domination which limits the capacity and potential of liberation. Decolonial theorists describe the conventional appropriations of intersectionality as rooted in the coloniality of power, knowledge, and being. Kurtis and Adams (2016) discusses the modern global order, rooted in the harmful legacy of racialized colonial violence that allowed Euro-American global domination, which perpetuates the traditional curriculum. According to Kurtis and Adams (2016), there is a need to disrupt the current domination of the marginalized many for the benefit of the privileged few. A decolonized intersectionality calls upon and elevates the voice of the silenced perspectives, knowing, and being of people in Majority-World spaces to "propose sustainable ways of being consistent with global social justice" (Kurtis and Adams, 2016, p. 47).

In the context of social justice, Chitiga (2019) discussed the purpose and consequences of Historically Black Colleges and Universities HBCUs as it relates to the miseducation of Black communities with emphasis on governance, management, leadership, the academic core, curricula exposure, student development, socialization, and cultural exposure. According to Carter G. Woodson, "African Americans have been educated away from their own culture and traditions, attached to the fringes of European culture, and dislocated from themselves.... African Americans often valorize European culture to the detriment of their own heritage" (Asante, 2003, p. 37). The White, Anglo-Saxon, Protestant, oppression-cleansed narrative is propagated in higher education curriculums while non-White perspectives are marginalized, disrupted, or removed (Harris and Watson-Vandiver, 2020). Henry A. Giroux, *In Pedagogy and the politics of hope*, argues that historical illiteracy is both an "engrained and intentional phenomenon that is a by-product of knowledge control and that engagement with pre-colonial history is transformative in our own self-actualization experiences" (Harris and Watson-Vandiver, 2020, p. 4). Historical illiteracy is counterproductive to the self-liberation and self-actualization of Black people as discussed by Carter G. Woodson (originally published in 1933) in *The Miseducation of the Negro*.

If you can control a man's thinking you do not have to worry about his action. When you determine what a man shall think you do not have to concern yourself about what he will do. If you make a man feel that he is inferior, you do not have to compel him to accept an inferior status, for he will seek it himself. If you make a man think that he is justly an outcast, you do not have to order him to the back door. He will go without being told; and if there is no back door, his very nature will demand one (p. 192).

Because much of African history has not been told or told from a White perspective and overshadowed by Western thought, these stories have been omitted and underrepresented in HBCU curriculums. Chitiga (2014) argues that "many people are not equipped with the necessary knowledge of American political history, democratic institutions, processes, and civic life needed to allow them to become active, effective, responsible, and empowered citizens and leaders of the future (p. 59)". Weber (2010) asserts that "full citizenship rights, for inclusion in the political process, and thus for an equal voice in public policies has been long and difficult" (p. 121). Furthermore, Weber (2010) discusses that "participation in the political institutions of society defines groups' relationships to the policy enforcement institutions (law, criminal justice, the police, and the military)" (p. 121). "Control over the political domain also increases control in the ideological and economic domains by increasing power over the production of controlling ideologies about subordinate groups and by increasing access to greater economic resources" (Weber, 2010, p. 121).

In America for example, because of the overrepresentation of white, heterosexual males in Congress, this group is able to pass legislation that supports the economic dominance (tax legislation, business legislation, etc.) of this particular group. Resources are directed to support this group, along with their constituents. As a result of miseducation, omission, and underrepresentation, there are other domains that are affected that may seem less obvious, such as health. Weber (2010) argues that because resources are typically directed to those that have an elevated voice in decision making, such as in healthcare, the life expectancy and disease rates of communities tend to be higher in those communities of color where there are less people of color on city council. As students learn more about themselves and "participate in developing the pedagogy of their liberation" (p. 48), with emphasis on the democratic proposals of problem-posing education where "men and women develop their power to perceive critically the way they exist in the

world with which and in which they find themselves; will they then come to see the world not as a static reality but as a reality in the process of transformation (p. 12)" in which they can bring about social change (Freire, 1996).

Navigating Whiteness and White patriarchy is a skill that must be a part of the higher education curriculum for students of color to fully understand the world around them and their place in that world, which has led to a decline in Black historical consciousness. Decolonizing the higher education curriculum calls for a form of academic resistance into the White narrative that perpetuates much of higher education institutions, and as a result, the learning experience of many students of color as the counternarrative. Furthermore, it is necessary for higher education globally to examine their own implicit biases, deep-rooted assumptions, and beliefs as it relates to its history and commitment to critical Black pedagogy.

Instructional leadership in decolonizing the curriculum

Transformational leadership is vital to the longevity of public and private institutions of higher learning, specifically, HBCUs in fulfilling their missions and upholding their historical values (Chitiga, 2018). Furthermore, transformational leadership in organizations is necessary to promote, support, and ensure equity, inclusion, and social justice in the interrogation of past policies, practices, and ways of knowing and being. Transformational leadership is at the forefront of driving this change (Chitiga, 2018). According to Neophytou and Valiandes (2013), the curriculum should not be seen as a document that is preplanned with content, outcomes, learning objectives, assignments, activities, and the plan to get there. On the contrary, the curriculum is a living document that serves as a lived experience of the people infused with their meaning and interpretation of that experience as it relates to their knowing and being (Aoki, 1991, 14, cited in Joseph, 2011a,b).

Furthermore, this curriculum should be intentionally, carefully, and thoughtfully created, to include a specific set of ideas that elevate the voice and agency of the knowers. As a result, a curriculum cannot be implemented as a mass of ideas or content, but must be carried out in a diminutive manner, centering the voice of the authentic knowers. The "old curriculum" may be thought of as a cooking recipe where the ingredients, instructions, and therefore, the final product, are predetermined. However, transforming and decolonizing the curriculum requires a co-creation of learning where the knowledge and capacity of the knowers emerges in strength-based approaches to set the path for learning. The higher education then provides the platform for critical Black pedagogy as the Black student then develops the agency to create the learning necessary for liberation. This requires a shifting of power where the student has agency in the ingredients and the instructions of this recipe, which means a different product (of liberation) possibly for each student.

Transformation leadership is an impetus for decolonizing the curriculum. Critical literacy in higher education is necessary for effective transformational leadership in decolonizing the curriculum. Critical literacy supports a holistic meaning of the world in which we live. As an example, texts in critical literacy are designed to facilitate productive dialog as "vehicles through which individuals communicate with one another using the codes and conventions of society" (Robinson and Robinson, 2003, p. 413). However, the challenge then becomes applying critical literacy in a field where there is a saturation of anti-critical monologue (Robinson and Robinson, 2003). Furthermore, critical literacy empowers students and teachers to learn together in a co-creation of knowledge. There is no longer a "sage on the stage." As a result, social constructs are reconstructed with new meaning. Lefkios (2013) describes a critically literate individual as one who has a solid competency in power dynamics and relationships and most importantly, is an intellectual leader who initiates the transformation of a society for liberation of a better future. Leithwood et al. (2004), Wahlstrom et al. (2010), and Hallinger (2011) discuss the importance of defining the school's mission, providing the necessary supports to faculty and staff to accomplish high quality teaching, organizing the school appropriately, and managing the instructional program (Brazier and Bauer, 2013, p. 650).

It is important that higher education institutions are supported in this transformation of leadership as critically literate instructional leaders. It must be acknowledged that many higher education institutions have been socialized according to the "old curriculum" and there is a "renewing of the mind" necessary for effective implementation of this "new curriculum" discussed here. There must be space provided for reflexive practice to hone the skills required for an instructional leader that is facilitating the Black consciousness of students for social change through critical Black pedagogy. Heifetz and Laurie (1997) as cited in Chitiga (2018), posits that transformational leaders strive "to engage in confronting the challenge, adjusting their values, changing perspectives, and learning new habits" (p. 134). Brazier and Bauer (2013) discussed the need for a reimagining of leadership preparation for instructional leaders on the basis of pedagogical content knowledge, educational connoisseurship and educational criticism in the context of leadership.

As noted above, students, teachers, and teacher trainers have already been deeply socialized by prior "banking" models (Shor, 1999). In the banking model, students are asked to uncritically accept information by the individual who possesses the knowledge, the "sage on the stage." The opposite of the banking model is the "problem posing" concept, discussed by critical theorist Paul Freire in *Pedagogy of the Oppressed*, where students are presented with a problem affecting society and are challenged to critically evaluate the problem from a cultural and social perspective (Chitiga, 2014).

In the current climate that many higher education institutions are experiencing, an increase in demands, but a lack of capacity, it is imperative that spaces and opportunities be created for sharing and collaboration among colleagues to improve the quality, vitality, and relevance of transforming curriculums in demand-driven spaces. Because some higher education institutions are required to teach more, research more, and administer more, the World Wide Web (WWW) also offers a plethora of support, research, and resources to assist teachers in their development as instructional leaders equipped for transformational leadership

that the decolonization of the curriculum requires (Engel, 2016). Engel (2016) suggests creating online spaces (e.g. Zoom rooms, Google Meet, Canvas Conferences, Facebook Hangouts) for teachers to share helpful resources, such as subject outlines, lectures, tutorial ideas, simulations, games, readings, and other helpful information. Contributions could be made under a creative common license to allow for modifications and accommodations for those that contribute a required amount of resources, as decided by the group, based on the teacher, institution, and student needs and requirements (p. 564).

According to Chitiga (2018), “transformational leadership is central to empowering leaders and subordinates to mutually engage with each other to ensure the transformation of organizations” (p. 60). For teachers to have the capacity and know-how to empower their students, teachers must also be empowered by their trainers. Those that have the responsibility and opportunity of training teachers must also be acknowledged as transformative leaders of transformative leaders that are leading other transformative leaders, their students (Neophytou and Valiandes, 2013).

Curriculum transformation is directly related to transformational leadership. Transformational leaders support the holistic development of students and are committed to the positive learning experience of students that ensure positive student outcomes, specifically, increased student achievement, which is an impetus for the growth of the institution (Chitiga, 2018). For transformational leadership to decolonize the curriculum, it is necessary for instructional leaders to transition from the banking model, anti-critical monolithic model of education, to a more self-authored, self-defined, student-centered, problem-based learning approach, where students’ agency is increased as the authentic knowers of knowledge based on their lived experiences which will disrupt the dominant narrative found in many curriculums at higher education institutions (Brazier and Bauer, 2013, p. 680). Instructional leadership goes beyond passing tests and achieving minimum standards, but requires critical reflection, the interrogation of pedagogy and practices, leadership knowledge, skills, dispositions, and courage, conducive for transformational leadership. This means continuing down an iterative path of inquiry and continuous improvement as it relates to teaching and learning (Brazier and Bauer, 2013, p. 647).

Curriculum and Blacks in higher education

According to Neophytou and Valiandes (2013), “it (curriculum transformation) is primarily a multi-layered socio-cultural, political, and ethical process (Joseph, 2011a,b) requiring active comprehension and artistry. It is human oriented and human necessitating: it aims toward people and needs people to gain its substance” (p. 415). Engel (2016) suggests adding to the “old curriculum” by adapting current offerings to the “new curriculum” with a focus on student-centeredness as the student as consumer.

As a case, this chapter contextualizes the HBCU within a crucial historical epoch—the 1940s–1960s Civil rights and Black consciousness movement that led to significant legislative changes that were intended to advance the rights of Black people in the United States. It argues that sometime after the Civil Rights Act of 1964, most HBCUs lost sight of their role in preparing critically conscious students. Given the current 2020 revitalization and re-examination of the “civil rights” fight, the chapter provides insights for HBCUs to reinvestigate their relevance by proposing some bold changes to the total curricula.

The majority of HBCUs were founded after the US Civil War (1861–65). While most private HBCUs were formed by Christian church organizations, many were chartered by states led by developed by White politicians, with the support of business owners who largely sought to use education as a tool to socialize African Americans to be submissive and docile workers. As HBCUs began to evolve, they became sites of empowerment for African Americans that produced Civil Rights, Black Power, and Pan African leaders. Until the Reconstruction period (1865–1877), African Americans were prohibited from attaining an education (Weber, 2010, p. 164). Historically Black Colleges and Universities (HBCUs) were created to promote liberation of African Americans through education.

Currently, HBCUs “graduate 25% of all African Americans earning bachelor’s degrees, produce over 30% of Black engineers, 50% of Black elected members of Congress, and 80% of Black federal judges. Furthermore, one-third of Black Americans with a doctorate in science, technology, engineering, or math (STEM) fields earned their undergraduate degrees from HBCUs” (Strayhorn, 2020, p. 7). According to the [Hundred-Seven.org](#), there are currently 107 (56 private/51 public) HBCUs in the United States of America, serving approximately 228,000 students. In *A Pledge of Allegiance to America’s Historically Black Colleges and Universities: Key Priorities of the Biden-Harris Education Agenda*, Dr. Terrell Strayhorn (2020) asserts that “HBCUs have long since been physical manifestations of Black excellence, cultural repositories of the Black lived experience in America” (p. 7).

HBCUs have supported the social and economic mobility of African Americans through education. Weber (2010) posits “the institution of education supports both the political and economic structures of society, but at its core it is an ideological institution, intended to create and transmit the ideas on which society is organized and which will support its continuation” (p. 145). George Kuh asserts that higher education remains more important than ever as social and political issues become increasingly complex (Kuh, 2001). According to Harris and Watson-Vandiver (2020), decolonial education is a force of activism with education’s role serving as an equalizer for change. Dr. Hakim Lucas, President and Chief Executive (CEO) of Virginia Union University proclaims that HBCUs offer students’ academic programs and experiences where they grow and develop cultural, spiritual, economic, and political sensibility which sets them apart as global leaders (Strayhorn, 2021, p. 6). As such, colleges, HBCUs, are “critical in the reproduction of social class and racial advantage” (Weber, 2010, p. 180) and the critical Black pedagogy. The responsibility of HBCUs to support the development of the Black consciousness movement through critical Black pedagogy by decolonizing the higher education landscape for the empowerment of 21st century African American students can be found in mission statements of HBCUs from across the country.

Spelman College, located in Atlanta, Georgia, was founded April 11, 1881, as an Atlanta Baptist Female Seminary by Sophia B. Packard and Harriet E. Giles. According to its mission statement, Spelman College asserts to empower its students to engage the many cultures of the world while inspiring a commitment to positive social change. Similarly, Morehouse College, also in Atlanta, Georgia, founded February 14, 1867 by Reverend William Jefferson White, Reverend Richard C. Coulter, and Reverend Edmund Turney, declares their mission is to assume special responsibility for teaching the history and culture of black people. Xavier University of Louisiana, located in New Orleans, Louisiana, founded October 6, 1925 by Saint Katharine Drexel and the Sisters of the Blessed Sacrament avows its mission to contribute to the promotion of a more just and humane society by preparing its students to assume roles of leadership and service in a global society. Tuskegee University, located in Tuskegee, Alabama, founded July 4, 1881, by George Campbell and Lewis Adams, states their mission is to produce public-spirited graduates who are both competent and morally committed to public service with integrity and excellence. Although not necessarily specifically stated in terms of Black students, Tuskegee reiterates its commitment to producing graduates that are prepared to serve with “sensitivity” and uplift their country through the high leveled training received at the institution. Hampton University, located in Hampton, VA, founded September 17, 1861 by Benjamin Butler and Mary Peake, emphasizes its focus on the liberal arts in the development of character. North Carolina A & T, located in Greensboro, North Carolina, founded March 9, 1891 by the North Carolina General Assembly, discusses in its mission statement its commitment to develop students that have the capacity and know-how to create innovative solutions that address the challenges and economic needs of North Carolina, the nation and the world. Howard University, located in Washington, DC, founded March 2, 1867, by General Oliver O. Howard, specifically states their mission to provide an educational experience of exceptional quality with a focus on educational opportunities for Black students. In addition, Howard University states their commitment to developing “historically aware” students that are equipped to solve human problems in the United States and throughout the world. Claflin University, located in Orangeburg, South Carolina, founded in 1869 by Methodist missionaries, Dr. Alonzo Webster (the university was named after Lee and William Claflin), states its dedication to providing a student-centered, liberal arts education grounded in cutting-edge research, experiential learning, state-of-the art technology, community service, and life-long personal and professional fulfillment.

To reinvigorate their fading relevance, HBCUs must recommit to raising the level of Black consciousness in preparing students to be change agents through critical Black pedagogy. This requires bold changes to the total curricula which involves a decolonization of the curriculum, where culture, student-agency, and understanding of the broader socio-political context that is directly connected to Black history emerges from the institutional curriculum, not a single course. This must be the focus so that students are prepared to be the public-service, social change agents described in the HBCU mission statements above. Black students must see themselves in the world as they help to solve problems of the world for their own liberation. Demonstrated in the mission statements, the emerging themes of raising the consciousness of Black students through the education of Black history rings true throughout many of our HBCUs across the country. With HBCUs housing many Black students, in decolonizing curriculums, our HBCUs have a great opportunity to deliberately empower its students through critical Black pedagogy that raises Black consciousness to promote and empower social change.

Concluding thoughts

The idea in this chapter is that the curriculum should not just focus on skills (McCarthy, 2015) or outcomes but should also promote inclusivity in multiracial societies (Banks, 2015) and close gender gap (DiPrete and Buchmann, 2013) in higher education. Thus, curriculum transformation in higher education should call for the development of inclusive perspectives within interdisciplinary fields such as women’s studies, ethnic studies, queer studies, deaf studies, and studies of multiple different abilities. Teaching these studies in higher education curriculum, throughout academic programs, ensures that all students graduate with a comprehensive knowledge of diversity, inclusion, equity, and social change across disciplines. To support the learning, identity development, self-actualization, and liberation of marginalized communities, culturally relevant critical Black pedagogy, that includes a curriculum that recognizes, appreciates, and celebrates the culture, histories, and aspirations of all groups, is vital for 21st century learners, to the development of Black critical consciousness. Holistic student development and academic engagement depends on a decolonized curriculum where students can see themselves in the world through a problem-posed education. Diverse students, teachers, and faculty are needed to deconstruct power in the classroom so that learning can be co-created through productive dialog.

Introduction

Low rates of retention and completion amongst students from traditionally excluded communities has been a long standing challenge for higher education (HE) globally (Aina et al., 2018; Love, 1993; Vignoles and Powdthavee, 2009). In the United Kingdom, black students are more than 50% more likely to drop out when compared to their white and Asian counterparts (Bulman, 2017). A report by the University Partnerships Program Foundation (Brabner, 2017) also found worrying rates of non-completion amongst those marginalized students targeted by widening participation initiatives in British Universities. A similar trend can be observed in the United States where the Hechinger Report (Sanchez and Kolodner, 2021) found white students to be far more likely to graduate than their African American and Hispanic students in public universities. In Nigeria, a protracted labor relations dispute between academics and the federal government has pushed many students out of the university system (Salako, 2022). Moreover, the disproportionate impact of the Covid-19 pandemic on black communities is thus likely to worsen what has already but an untenable condition for marginalized communities in HE.

In order to mitigate against the exclusion of students from traditionally marginalized communities, governments have identified various student financial aid models to facilitate equitable HE participation with mixed results. The American Pell Grant (Ishitani, 2020), the UK's income-contingent student loan model (Callender and Jackson, 2004) and Kenya's Higher Education Loans Board (HELB) (Mobegi and Kara, 2022) are examples of such interventions. Prominent amongst these financial aid models has been the cost-sharing principle of income contingent student loans (ICLs), a form of student loan that enables fee-free access to HE at point of access with deferred repayment due once graduates begin earning. In South Africa, the democratic government established the National Students Financial Aid Scheme (NSFAS), an ICL scheme aimed at improving the participation and representation of poor and working class students in HE.

Nearly three decades since the end of apartheid, despite bold widening participation targets, by the year 2020, only 5.9% of South Africans between the ages of 25 and 64 had achieved a bachelor's degree from a university (DHET, 2021). When assessed in terms of participation by race, the South African picture remains far from equal, with the university participation rate amongst African youth at 18% compared to 56% amongst their white counterparts (DHET, 2021). This level of inequality deepens when one looks at which universities and degree programmes remain (in)accessible to which categories of students and graduates from which university. The picture gets bleaker when we look at the question of who graduates? And who graduates from where? (Masutha and Naidoo, 2021).

Despite NSFAS's strides, low student retention and completion rates remains a major challenge to South African higher education's pursuit for just and equitable educational experiences and outcomes (Angu, 2019; Bernard, 2018; de Villiers, 2012; Kelly-Laubscher et al., 2018; Masutha and Naidoo, 2021). When access to HE is understood to mean more than the demographic

composition of the student population, regrettably, and of particular concern in this article, the growth of financial aid funded students has occurred alongside very high non-completion rates amongst this group of students. The first ministerial review of the NSFAS scheme revealed that by 2010 (DHET, 2010, p. 51) “67% of 656,000 financial aid-funded students were no longer in higher education; 72% of this 67% dropped out without completing their studies; and only 28% graduated” (DHET, 2010, p. 51). In their 2018 study on factors affecting the success of First-Generation students at a South African university (Kelly-Laubscher et al., 2018), observed how patterns of access, retention and success in South African higher education continue to reflect the country’s patterns of class and racial inequality. They found that:

... even for those participating in higher education, the throughput of African and Coloured students is lower than their white counterparts, with only 20 and 24 per cent of African and coloured students, respectively, graduating within the regulation time for their diplomas/degrees, compared to 44 per cent of white students ... It is clear from these statistics that increased participation by these groups has not resulted in a corresponding increase in graduation rates and throughput.

Kelly-Laubscher et al. (2018, p. 98).

While the challenge of non-completion remains prevalent amongst students from all walks of life, it has particularly paralyzed the HE aspirations and experiences of financial aid funded students, all of whom come from poor and working-class households. In this article, “poor and working class student” refers to a student from a household with an annual income of up to R350 000.00 (21 000 USD) as designated by the South Africa’s National Students Financial Aid Scheme (NSFAS, 2019). These are children of families of unemployed parents, those surviving on social security grants, farm workers, mineworkers, security guards, and entry level public servants (DHET, 2021).

Student alienation, Poverty, financial pressures, mental health issues, a student debt crisis, mismatch between students’ expectations and their subsequent reality of HE are some of the common factors attributed to persistent disparities in student retention and completion rates in HE (Greenfield, 2021; Letseka and Breier, 2008; Moodley and Singh, 2015). However important these factors are, the picture remains incomplete without the voice and narrative accounts of those students who “dropped out” and those who experienced teaching this group of students. Given that students who dropout often disappear without a trace, conventional theories of student non-completion tend to lack the voice and lived realities of students who dropout and academic staff who have experienced teaching this group of students. We know little about the side of the story of those who “dropped out” of HE and those who experienced teaching this group of students. Current representations of the dropout problem are thus incomplete and mainly from the perspective of dominant groups in HE. This article contributes toward addressing this gap in knowledge.

Drawing on data from narrative interviews with financial-aid funded students (who dropped out of university), academic and support staff (who shared their experiences to teaching and interacting with this group of students), this study contributes a counter narrative to the dominant and unjust single story prevalent in common conceptions of non-completion amongst underprivileged students in HE (Flint, 2021; Mallman et al., 2021; Mills and Gale, 2011; Owusu-Kwarteng, 2020). Indeed, continuous critical exploration of this challenge in teaching and learning has its basis and justification on the personal, family, institutional and community-wide costs involved in the educational journeys and aspirations of students from marginalized households and communities being cut short prior to attaining their qualifications. The revolving door of black working-class non-completion in HE also undermines the very idea of (higher) education as a vehicle that should contribute to more just and less stratified futures.

The next section of the article outlines of how Carol Bacchi’s WPR (What’s the Problem Represented to be) approach (Bacchi, 2012) and Chimamanda Ngozi Adichie’s notion of *Danger of a single story* (Adichie, 2009) inspire an alternative and arguably more just approach in disrupting fragmentary and unjust ways in which the dropout “problem” amongst financial aid funded students in South African universities has been *represented* in mainstream narratives, and the adverse implications of such *single story problematization* on marginalized students’ experiences of teaching and learning in HE. This is followed by a thematic analysis (Braun and Clarke, 2006) of participants’ narrative accounts and the lessons that flow from a close up analysis of participants’ first person accounts. For the rest of the article, in addition to illuminating the limits of financial aid in insulating poor and working-class students from unequal and marginalizing HE experiences, this article contends with the increasingly dominant and largely taken-for-granted equal-opportunity theories of teaching and learning that inform the *single story problematization* of low retention and completion rates amongst marginalized students. To the extent that power is the position to not only tell the story of another person, but to make it the definitive story of that person, this article takes back that narrative power and foreground the voices and lived experiences that often go unheard as valid, valuable and critical in theorizing students’ experiences of non-completion in HE.

Chimamanda Ngozi Adichie: the danger of a single story

... to create a single story, show a people as one thing, as only one thing, over and over again, and that is what they become ... It is impossible to talk about the single story without talking about power. Like our economic and political worlds, stories too are defined by the principle of nkali (inequality): how they are told, who tells them, when they’re told, how many stories are told, are really dependent on power ... Power is the ability not just to tell the story of another person, but to make it the definitive story of that person ... The consequence of the single story is this: It robs people of dignity ... I would like to end with this thought: that when we reject the single story, when we realize that there is never a single story about any place, we regain a kind of paradise.

Adichie (2009).

The excerpt above comes from *The Danger of a Single Story*, a TEDTalk presentation that Nigerian novelist Chimamanda Ngozi Adichie delivered in 2009 (Adichie, 2009). Adichie's TedTalk has since been watched 10 million times on Youtube.

Adichie skillfully affirms those who have long embraced counter storytelling "as both a method of telling the story of those experiences that have not been silenced and as a tool for analyzing and challenging the privileging of the majoritarian narratives and making explicit the extent to which they "act as a camouflage for the self-interest, power, and privilege of dominant groups" (Solórzano and Yosso, 2002a). Adichie urges us to get closer to the lived realities of those whose stories are often distorted and silenced in order to understand the dangers of certain people and their experiences being packaged into a single story by those in positions of power. In naming their reality, counter-storytellers provide those in the margins of society with "psychic and emotional barriers against the damage caused by majoritarian stories that, for instance, blame people who are targeted by racism for their own subordination" (Love, 2004).

Carol Bacchi's WPR approach

Bacchi's WPR approach is premised on the idea that what one advances as a solution to certain challenges reveals what that person or institution thinks is the problem or needs to change, and that "policies and policy proposals contain *implicit* representations of what is considered to be the 'problem' ('problem representations')" (Bacchi, 2012, p. 21). For (Bacchi, 2009) "there are no problems separate from the proposals purported to address them", and that in our analysis of various "problem representations" should pose the following questions: (a) *What's the problem represented to be in a specific policy or policy proposal?*; (b) *How has this representation of the problem come about?* (c) *what are the rationales and deep seated assumptions behind the representation of the "problem"*; (d) *What is left unproblematic in this problem representation? Where are the silences? Can the "problem" be conceptualized differently?*; (e) *What effects are produced by this representation of the "problem"?* (Bacchi, 2012, p. 21).

The end goal is to re-problematize "problem representations" inherent in certain policy statements and to subject them to critical scrutiny. Given that certain "problem representations benefit the members of some groups at the expense of others", our task as researchers is "to challenge problem representations that have these deleterious effects, and to suggest that issues could be thought about in ways that might avoid at least some of these effects (Bacchi, 2009). As a researcher, I am committed to this goal. I believe the manner in which the challenge of non-completion amongst financial aid students has been represented is unjust and contains such deleterious effects.

Despite South African HE still operating under the shadow of its colonial self, the following excerpts by South African policy-makers get us close to *the seat of the trouble* (Woodson, 1969), they exemplify the victim-blaming and deficit *single story* through which the "problem" of non-completion amongst financial students is currently "represented" in South African Universities:

In responding to the dropout challenge, the Minister of Higher Education and Training expressed his failure "*understand why people would want to fail twice or even more*" given the "*huge number of pupils who passed matric with flying colors, but sadly cannot afford to go to university*. Is that fair?" he asked (Ncwane, 2020). More recently, his department announced that it was looking to amend the funding progression rules wherein financial aid funded students would be required to pass at least 75% of their modules in order to qualify for continued financial aid (Mkhwanazi, 2021). Echoing the Minister, Professor Adam Habib, former Vice Chancellor and Principal of University of the Witwatersrand, characterized the dropout rate as "*a shocking waste of human talent*" (News, 2016).

The above assertions share rationales and deep seated assumptions that have informed the *single story* through which students who dropout of HE have been theorized as "early leavers from HE" (Davies and Elias, 2003) due to their "course dropping behavior" (McKinney et al., 2019). As (Mallman, 2017) observed, this victim-blaming not only looks at half an already distorted picture, it also induces feelings of inadequacy and illegitimacy, leading some students to view their failure as inevitable. It is therefore important that we critically examine the single story because of its roots in *structures of power* in higher education institutions (HEIs) and its influence in policy making circles (Bacchi, 2000). In doing so, it is important that we remain alive to the ways in which the single story is sometimes deployed to inform and justify punitive forms of pedagogy that obscures the exclusion of vulnerable groups of students (Allen, 2020).

Method

This article reports on a section of my doctoral study that examined narrative accounts of working-class students' experiences of completion and noncompletion across three different status universities in South Africa (a traditionally white university, a traditionally black university and a post-apartheid merger university), and how insights from such experiences can help move understandings of (under)achievement rates amongst financial aid funded BWS beyond the single story problematization. By adopting a qualitative narrative approach to studying the challenge of student non-completion in HE, this study further advances a growing body of researchers who foreground the voice and lived experiences of the unheard as valid, valuable and critical in theorizing of persistent inequality in education (Arbouin, 2018). Stories are not just stories, they are fundamental to illuminating key dimensions of our lived experiences (Hinchman and Hinchman, 1997). It is through storytelling that we as educators come to know what they

know about teaching and learning experiences and this in turn makes narratives one of the most effective methods of understanding and representing educational experiences (Connelly and Clandinin, 1990).

A total of forty-six in-depth narrative interviews with twenty-four financial aid funded black working class graduates and drop-outs and twenty-two academic and support staff were conducted at three different status universities (Traditionally Black University, Traditionally White University and Merger University). A combination of purposeful sampling, maximum variation sampling and snow-balling techniques were employed (Neuman, 2000).

Findings

The untold sides of the single story representations of the dropout challenge in HE

Narratives included in this article are not representative of the entire dataset, I seek not to generalize participants' experiences but rather to illuminate key dimensions of their narrative accounts as they relate to representations of the problem of non-completion amongst financial aid students. Linda and Wadzi are financial aid funded dropouts from Merger University, an urban university based in South Africa's economic hub. I lifted their stories because they highlight the many sides of dropouts that are not captured and in many ways silenced in dominant conceptions of teaching and learning in HE. Narrative accounts of Professor Kigali (Ivory Tower University) and Professor Ngoye (Merger University) were also purposefully selected for analysis because they worked closely with undergraduate financial aid students. Participiant's names have been replaced with pseudonyms throughout this article.

Linda's story

Linda was born and raised in a rural village in Kwa-Zulu Natal Province. In his region there is hardly any economic or industrial activity taking place, unemployment levels are high, and the vast majority of households are dependent on subsistence farming and government's social security grants for pensioners and mothers with children under the age of 18. Neither his parents nor any of his six sisters went to university, making him the first in his family. By the time Linda was six, his mother left him with his six sisters to work as a domestic worker in Johannesburg, about 600 km from their village. His mother sadly passed away in his first year of study at Merger University, leaving him and his sisters orphaned.

Even though Linda knew no one who had ever been to university and very little about what actually happens at the university, he always *"wanted to go to varsity so that obviously the only picture you have in your head is to change your family situation, to change those houses that are made of mud and everything and just, you want a better life ... You want to make your parents proud. And that was the main reason obviously"* he said.

Homeless and new in town

Linda experienced a turbulent transition and hard landing into HE which was due to a variety of hindering factors. His first hindrance had to do with his uncertain sources of funding and lack of familiarity with the funding opportunities available to people of his socio-economic status. He admits that after completing his secondary education he had no idea what to do next. Due to his funding situation, hardly halfway into the first semester of his first year of study, Linda found himself homeless in a town he knew no one. He explains:

LINDA ... we {him and his secondary school mates} had no idea on what to do, how to get to varsity. The only thing we were given were application forms There were no bursaries and I will tell you now that I was one of the students who didn't know how to apply for NSFAS or if there are any other bursaries except NSFAS.

It's funny because I went there (University), I knew no-one, I had no siblings, I had applied for accommodation but I had to pay some fees, a certain amount of money which I felt like I can't pay because I have to pay monthly. Since I haven't got funding, I can't do that. So, I went there and I have no place to stay. So, I think I spent a week or so living at the taxi rank and going to varsity. It was in the early days of varsity still dealing with the registration.

Thrown into the deep end

His lack of familiarity with the university and its institutional cultures and practices was worsened by his non-existent portfolio of social capital. The excerpt below illustrates how Linda experienced the first few weeks upon arrival at the university:

MUKOVHE: ... *When you first arrived at University, what did you know about the University?*

LINDA: To tell you the truth, I had no idea what was expected of me. I mean, I spent the whole first semester without a tutor. Most students were assigned to tutors and I wasn't because I had no idea there are people called tutors ... To tell you the truth, I think the reason why I didn't know about tutors and everything was because I missed out on most of my classes because I was getting lost on campus trying to find classes and everything.

I spent like first two weeks without a timetable because you had to make one for yourself. They say you first have to look into a computer and then ... I had no idea. So, that's two weeks wasted. I have no idea. I just go there to varsity, look around, geez, I don't know what's going on, until some of the students helped me create one ... that was the most painful part, knowing that someone could have helped me with other things, but I had no idea.

The language constraint: "... it was a different experience for me having to hear someone trying to teach me in English throughout the lecture"

Inside the classroom, Linda's struggle with the English language hindered both his confidence and ability to engage with what was being taught. It was particularly challenging for him to transition from having been taught mainly in his home language in school to the university where lectures were delivered exclusively in English. He explained this frustration:

LINDA: And now that I got to varsity, my first lecture was in English. There I was struggling to understand, even scared to ask questions because obviously I was nervous ... it was a different experience for me having to hear someone trying to teach me in English throughout the lecture. I was there trying to hold those words that were difficult to me, trying to jot them down so that I can later on get some sort of explanation and definitions on that.

The English problem then weakened Linda's ability to mobilise and accumulate much needed social capital and access student support services, a reality that further weakened his transition and integration period.

LINDA: It took me some time to make friends and by then I feel like it was already late because I had missed out on a lot of things. And I think University was just confusing for me. I mean, there were buses that I didn't even know about them, the bus is taking students from varsity to town ... I would have saved a lot {of time and money} but I didn't know about that. I only caught up on the second semester.

Lost in a crowd

While struggling to find his foot on campus, Linda battled with an institutional culture he found to be "strict", "rough" and "confusing". Thrown in the deep end, he felt "university has no time" for someone with his slow pace of figuring things out, pace of learning, weak knowledge of technology, etc.

LINDA: I would say that university is so strict and it's even confusing if you're a first-time student in varsity. It's so confusing. Like you get lost and no-one will help you. It's like you are there to study, so you got to figure it out yourself. They don't care if you know the University life or not, you're just there to study. You have to know everything fast and it wasn't easy for me.

So, I was still struggling using emails, I remember that was the first time of having an email and I didn't know that the communication in varsity is done through emails, then even if you're going to have a test, you're going to be told via email and everything is like that. I created my email, but I hadn't checked it and only to find out that when I asked, when I was talking to some of the kids that I was in class with, they were like, "we were writing a test yesterday", and I'm like where and when, how? They told me that they told us through email and that was the first time I opened my emails and only to find out that I've missed two of the tests because I wasn't able to use email and email was just a nuisance for me.

Linda found the university to be impatient and quite isolating to struggling students like him. He constantly sought to highlight to me the evident gap between his learner and cultural identity and the university's expectations of him:

LINDA: And that was, it was so difficult. I mean ... they have no time for excuses, they have no time to hear your side of the story. They want you to be there, they want you to be serious. In fact, when you go to varsity it's like you need to grow up. I don't know, they expect you to be this responsible individual who knows it all, who's capable of catching up fast and who's able to, I don't know, to be responsible enough to be there.

Persistence: down but not out

When Linda's financial aid was disrupted, he was forced to leave the university at the end of his first year of study. He did not quit his higher education altogether, instead he went back to work as a security guard in Johannesburg, saved some money and enrolled at a University the following year.

LINDA: And then I ran out of money. I spent a week not going to school until I called my mom and told her, no, let us discuss, I can't do it, I have to come back because I've run out of money, and she was like, "okay, cool, you can do that because I cannot support you either". Then this was the only option to drop out and I can't live here where I have no family and I have no money, so it's better to be in Johannesburg closer to my family and go to a nearer University.

Let down by the National Students Financial Aid Scheme

Having enrolled for a degree in Public Management and Governance at Merger University, Linda was failed by the National Students Financial aid scheme. With his mother late, Linda's household income was now zero. NSFAS' administrative deficiencies over the past years has resulted in the scheme approving more students that it had funding available, and Linda became one of the victims of this ineptitude. He cries about how his NSFAS funding application status remained "provisionally funded" throughout the year and yet his tuition debt remained on his student account at Merger University. He explains:

I was provisionally funded and by then it was around March. It was around this time when I went to ask them, and they told me that I was provisionally funded, but then because of the fact that the funding was not enough, they couldn't fund us. But it was provisionally funded, we had already qualified for funding, but we can't get it because there's not enough funds.

As a result, Linda's higher education journey crash landed due to NSFAS's administrative deficiencies. Despite his funding constraints, Linda continued attending classes at Merger University under the hope that NSFAS would eventually come through. It did not. At the end of the academic year Linda's academic records were withheld and he was denied registration the following academic year due to "*outstanding fees*". And that is how Linda was pushed out of the field of higher education.

Toward the end of our interview, I asked Linda to look back at his higher education experience and identify that which he wishes he knew about university prior to admission. He wished he known about the significance of "*orientation week*" in aiding transition into higher education, he wished he had made friends earlier and he wished he had known about the help offered by university tutors.

LINDA: I wish I managed to attend the orientation whereby I was going to be able to understand the campus better. But I couldn't be there because I was from far and obviously, I had to find a place to stay, which I failed to get, and I missed out on the orientation. But I wish I had understood the campus better, I had known most of the things about the campus life and what was expected of me as a student. And I wish I was able to make friends earlier and I wish I had a tutor.

Linda's humble beginnings, his grossly under-resourced schooling experiences, turbulent transition and hard landings on campus are consistent with all dropouts in this study (i.e Martin, Naledi, Tali and Wadzi). In this case, their stories were very similar.

Linda's story is also unique and does not fit into the stereotype of unteachable students who are "underprepared" for HE. Each chapter in his life story illuminates extraordinary dimensions of his journey to and through HE, particularly his possession of what (Yosso, 2005) calls aspirational, navigational and resistant capital. His ability and willingness to persist with his studies despite what appeared to be insurmountable barriers is inconsistent with the victim-blaming single story that is central to dominant theories of working-class non-completion in HE. His experience is wholly inconsistent with the simplistic and deficit *single story* representations of the "problem" of working-class experiences of non-completion in HE. Not only did he have to transform himself in order to be enculturated into the field of HE, he was let down by NSFAS when he needed it the most. The deficit single story representation of those who dropout of HE as failing financial aid students who need exit out of the system to make space for others is not only devoid of the extraordinary circumstances he endured, it is particularly silent on the largely inequitable institutional environment and its lack of preparedness to serve the educational needs of a diverse student population as some of the drivers of hindrances that Linda experienced on campus.

Wadzi's story

Although born and raised in very different parts of the country, Wadzi's story is very similar to that of Linda. Wadzi was born and raised in Hillbrow in a largely degenerated and working-class section of the city of Johannesburg. efore her passing, Wadzi's mother worked as a security guard while her father sold food to manual labourers for a living in order to pay rent and send Wadzi to school.

Once registered at Merger University, Wadzi's transition into higher education continued to be haunted by her outstanding NSFAS funding status. She could not measure her academic progress because the university, as part of their standard practice, withheld the grades of students whose tuition fee was outstanding. Toward the end of her first academic year at Merger University, Wadzi and the rest of NSFAS provisionally funded students were informed that NSFAS at Merger University has run out of funds and that they must try the following year. This effectively pushed Wadzi out of the university. The following year her NSFAS funding was once

again approved but she was prevented from registering until she cleared “her historic debt”. Unable to come up with the money, Wadzi was forced to drop out of Merger University. Until this day she has no idea how she performed academically as her grades remain withheld due to outstanding fees.

The University’s refusal for Wadzi to register for her second academic year left her father particularly devastated. *“So my dad was sick and tired of explaining to people. So he was quite disappointed. At some point I think he felt like he’s failing.”*

Their disappointment was worsened by how, whilst in ques for help at NSFAS offices on campus, Wadzi recalled witnessing fraud, favouritism and general disorganisation. A class mate informed her of a guy who was helping students secure NSFAS funding provided she brought a R1 000 bribe. She failed to raise the bribe amount and the girl who paid the bribe was sorted ... *“she went there and then now she’s studying; she’s doing her third year, she got NSFAS”*.

Today, given her experience with NSFAS at Merger University, Wadzi is not just disappointed that her educational journey crash-landed, she wants nothing to do with NSFAS.

You can’t even count on NSFAS. Don’t trust it ... I discovered that my problems were not even big problems. When I go to talk to people, people thought of bad things, some people even think of committing suicide because they’re failing. So one student’s mum was working as a domestic worker and then she failed, she failed dismally, and then at some point she thought of taking her life because she can’t face the disappointment. We all have our own stories to tell.

(Wadzi, Dropout, Merger University).

Teachers’ viewpoints: “NSFAS needs to go beyond just providing funds. NSFAS needs to look at the broader context”

Professor Kigali, a Lecturer at Ivory Tower University, reflected on the irony of the institutional violence directed at students like Linda who are excluded from the university despite their willingness to persist with their studies:

So, for me that {pushed dropout} presupposes certain things. It presupposes that this person is not teachable. That is the bottom line. And then the question becomes, who is not teachable? It presupposes that we have done everything that we can do as an institution to teach this person and when have we ever done that? So, fundamentally I would be opposed to this idea of exclusions because those two things are not evident, that a person is not teachable and that we have done everything that we can to teach but funny enough, even that exclusion thing is violence. That’s it. It is symbolic violence that results in real violence because you’ve conferred an identity on this person; you are not teachable. I mean, conferring that identity you are sentencing them to something, to a life where they’re not able then to meet the demands of the market society that we exist in.

(Prof Kigali, Ivory Tower).

Professor Kigali added that:

I think we also need to be careful about the values that are in our curriculum, the unspoken values in the curriculum that we take for granted I think even when we assess students, we are not just assessing how much they have memorised the contents, we are assessing how well they are able to produce it in the language that we want ... I think we take for granted that our pedagogy is not just the readings that we prescribe. Our pedagogy is the values that we promote.

(Prof Kigali, Ivory Tower).

Professor Ngoye sought to highlight the side of the financial aid student non-completion that is often silenced and thus not forming part of the single story representation of the problem of student non-completion. As a Lecturer in both historically black universities (HBUs) and historically white universities (HWUs), Prof Ngoye reflected on the varied ways (inadequacies) the NSFAS scheme was failing its beneficiaries and thus achieving the opposite of its stated objectives. HE felt that the scheme was not comprehensive enough:

if you look at the {financial aid} package as well, of what they approve ... If you travel from a rural province like your Limpopo, your Eastern Cape, your KZN, your Free State, you arrive in Johannesburg, you need accommodation, you also need food for you to survive. You need stationary, you need books, you need all sorts of things. You also need an iPad because our Universities require that by the time you arrive here you will be able to type assignments and those types of things ... NSFAS needs to go beyond just providing funds. NSFAS needs to look at the broader context. For various learners come from various backgrounds. They don’t just need funding, but they also need advice and guidance. And that is what NSFAS is not seeing. A roadshow in my view can be very useful. All NSFAS students are given funding and also being given some kind of orientation into the University life”.

(Prof Ngoye, Head of School, Merger University).

Prof Ngoye further identified NSFAS’s administrative deficiencies and mismanagement to adversely financial aid students’ transition, adjustment and integration at higher education institutions. Given that the academic year in South Africa commences in February, the delayed payment of financial aid packages was highlighted as some of the factors adversely affecting students’ transition and odds of completion.

With regard to the dropout rates of NSFAS recipients ... generally NSFAS applications are processed very late. At this point in time when we have commenced term two but you still have students who were supposed to have registered in January, NSFAS only approved their funding right now. It's better if the funding is secured and confirmed at least at the beginning of the year already, so that you start the term ... some people are from rural areas, they still need to learn how to use Blackboard (university's online platform), they still need to learn how to type their assignments and most of those interventions happen at the very beginning of the year. So, if you come now, you're assisted by a tutor to catch up. You've already missed the term's work and that really creates problems. If they can allocate the resident fee at least while they are processing the rest ... Its April now and there are some people who have just gotten an approval from NSFAS a week ago. They have not registered. They were not in the system. They will catch up with all the term's work

(Prof Ngoye, Head of School, Merger University).

Participants' (Linda, Wadzi, Prof Kigali and Prof Ngoye) narrative accounts present a composite counterstory that illuminate some of the key issues that are often silenced, omitted or ignored in dominant single story representations of the "problem" of high rates of non-completion amongst financial aid students in South African HE. The thematic thread highlighted across all these stories is consistent with the findings of the first Ministerial Review Report (The Balintulo Report, 2010) of the NSFAS Scheme during the year 2010. In addition to an array of administrative inefficiencies, mismanagement and corruption, the Balintulo Report found that:

NSFAS's major shortcoming is that the amount of funding available, despite steady annual increases, falls far short of demand. Current estimates are that NSFAS has only half of the funds it would need to meet the demand for student financial aid from qualifying applicants ... Some institutions choose to enhance the principle of access by awarding some NSFAS funding to all qualifying students resulting in students having to settle the difference between the award and the actual cost of studying.

DHET (2010, p. 73).

This practice, also known as "*top slicing*", resulted in many students incurring historic debt and therefore prevented from registering in order to proceed with their studies. Top-slicing also maintained financial disparities between expensive historically white universities (HWUs) and under-resourced and working-class serving historically black universities (HBUs) whose cost is far lower than the former. And yet, such critical reflections on the limitations of the scheme are often left out in the colorblind and meritocratic theories of the challenge of student non-completion in HE.

Applying Bacchi's WPR approach to representations of the dropout problem amongst financial aid funded students

When some of the key questions in Bacchi's WPR approach are applied to the student dropout problem, we get closer to seeing the limitations of the stereotypical *single story* through which the problem of students' non-completion has largely been represented. In advancing his failure "*to understand why people would want to fail twice or even more*" and bemoaning such expectations as *unfair*, we identify what the problem is represented to be. The Minister represents the problem as "*people {who} would want to fail twice or even more ... people who do not want to complete their courses and graduate in record time*". The proposed solution, as seen in the Minister's statements above, is that students who fail to pass a specified number of modules (e.g 75% of their modules in an academic year) should be academically excluded in order to make space for others to benefit and to make the system "fair".

Here we can see that the Minister's statement is anchored on a flawed and increasingly taken-for-granted idea of universities as equal-opportunity and meritocratic spaces (Gillborn, 2019; Ladson-Billings, 2006). The punitive side of the Minister's rationale (i.e. forced dropouts) is consistent with what (Drake, 2022) referred to as the criminalization of failure in education spaces. The rationales and deep seated assumptions behind this representation of the problem of non-completion has been thoroughly and correctly critiqued and discredited as mythical and the basis of perennial patterns of inequality in HE attainment (Arbouin, 2018; Boliver et al., 2021; Gallagher, 2003; Littler, 2017; Lucido et al., 2019). Writing for *The Conversation* (Lucido et al., 2019), identified the "the myth of meritocracy in higher education" as a key factor behind persistent inequality of access and outcomes to higher education. They added:

The most damaging myth in American higher education is that college admissions is about merit, and that merit is about striving for – and earning – academic excellence. This myth is often used as a weapon against policies like affirmative action that offer minor admissions advantages to low-income students and racial and ethnic minorities. The deck is stacked in favor of affluent parents who use their privilege and exploit these institutional needs to find their children a way into elite colleges.

Lucido et al. (2019).

As Ladson-Billings (2015) cautions, we often have plenty of verifiable facts about the extent of racial and class disparities in educational experiences and outcomes, but little in the way of the context in which we can make real sense of those facts. The colour-blind meritocracy single story serves to explain *what is wrong with financial aid funded students and their interaction (non-completion)*

with south african universities while silencing the question *what is wrong with the South African field of university education and its interactions with financial aid funded?* (Jackson and Moore, 2008). The role of South Africa's largely untransformed educational institutions with well known histories of excluding black working-class students (Naidoo, 2004) is left *unproblematic* and *silenced*.

As foregrounded in Wadzi and Linda's story, the student non-completion problem can be *conceptualized differently*. Are South African universities able to serve students from diverse social origins and with diverse social and educational needs? If not, what can universities improve their teaching and learning methods to address this gap in pedagogic relations? By looking beyond what this group of students is perceived to lack, this article makes visible the power imbalances and injustices that result from reducing marginalized groups through a single story and stereotypes (Adichie, 2009).

With much of the debate around inequality of access having focused on who gets to access HE in general (Boliver, 2013), suggest that we expand the scope of the debate from whom goes to university to who goes to which university? Who studies what at which university? This is particularly important given that inequality of access has been particularly striking in highly selective higher education institutions, with elite universities largely remaining a natural educational destination and preserve for children of the privileged middle and upper classes (Reay et al., 2001). As seen in participation's counterstories, what is also left unproblematic, despite being evidently problematic, is the impact of NSFAS's underfunding, administrative deficiencies, mismanagement and the adverse consequences of these institutional barriers on teaching and learning.

Conclusion

In this article, inspired by Carol Bacchi's WPR (What's the Problem Represented to be) approach and Chimamanda Ngozi Adichie's notion of *Danger of a single story*, i set out to challenge and hopefully disrupt a dangerous deficit, victim-blaming, colourblind and meritocratic *single story* through which the "problem" of high non-completion rates amongst financial aid funded students in South African HE has been *represented* amongst scholars, media and policymaking circles, and the implications of such *single story problematization* on experiences of teaching and learning in HE. Consistent with Adichie (2009), I conclude that how the stories of student non-completion are told, who tells them, when they're told, how many stories are told, are really dependent on unequal power relations prevalent within the field of HE.

Power is indeed the ability not just to tell the story of another person, but to make it the definitive story of that person (Adichie, 2009). Consistent with (Arbouin, 2018; Love, 2004; Yosso *, 2005), I call on researchers and policymakers working in unequal and complex contexts to look beyond the single story through which marginalized students are framed in majoritarian narratives. By centering Wadzi and Lida's story, this article takes back this power and foregrounds the voices and lived experiences that often go unheard as valid, valuable and critical in theorizing students' experiences of non-completion in HE.

Consistent with (Boliver et al., 2021; Carnevale et al., 2020; Littler, 2017) and others, I further advance that both formal and epistemic justice will remain elusive for as long as dominant notions of teaching and learning remain anchored on the mythical equal opportunity, victim-blaming, colourblind, meritocratic master narrative. As Wadzi and Lida's stories show, their lived realities in the field of HE were far from neutral or equal. New voices are needed to tell multiple versions of the stories of those who remain in the margins of HE's institutional logics (Griffin et al., 2014; Mills and Gale, 2011; Solórzano and Yosso, 2002b). This article is part of their counter-story.

In the words of Chimamanda Adichie:

Start the story with the arrows of the Native Americans, and not with the arrival of the British, and you have an entirely different story. Start the story with the failure of the African state, and not with the colonial creation of the African state, and you have an entirely different story ... I've always felt that it is impossible to engage properly with a place or a person without engaging with all of the stories of that place and that person.

The approach adopted in this study shows the value of listening to stories of those who often disappear without a trace from our campuses. Their stories are rich with lessons for educational researchers, policymakers and practitioners involved in transforming participation in South African HE and elsewhere in the world. Indeed this should fundamentally further problematising narrow and exclusive theories of low working-class retention and completion in HE that are devoid of their voice and those who have experienced teaching them. Further research needs to go into the social and education destinations of students who are forced out of the HE system despite their willingness to continue with their studies (Mathebula, 2019). makes a case for HE researchers and educators to recognize poor black youth as both givers and takes of knowledge or "epistemic contributors", and that doing so constitutes an ethical response to the structural inequalities that limit equitable university access and participation. Given the challenging circumstances embedded in participants' stories, I hope that participating in this study was at least of therapeutic value.

As shown in the work of (Brabner, 2017; Bulman, 2017; Sanchez and Kolodner, 2021), Linda and Wadzi's experiences are not unique to South Africa or developing countries. Marginalized educational transitions and intersectional disparities in rates of HE attainment are a global phenomenon. Given the acceleration of global inequality across class, gender and ethnic lines, South Africa being one of the most unequal societies in the world, can be seen as an extreme case of global patterns, and thus offers important insights for other contexts.

“Widening” access

Efforts to widen access to and build participation in higher education (HE) are largely concerned with redressing the historical and persistent underrepresentation of certain social groups in HE. The particular social groups recognized by policies have often been explicitly defined, although this is not consistently the case. For example, in Australia there are currently six “equity groups” identified by the Australian Federal government,¹ with a primary focus on students from low socio-economic status backgrounds; in China, policy has largely focused on rural and remote groups; in the United States a key policy emphasis has been people of color; in England it has been lower socio-economic groups, low-participation neighborhoods and people with disabilities (Ding, 2007; Gale and Tranter, 2011; Baptiste and Villa, 2012; Burke and Kuo, 2015); and in South Africa recent decades have seen significant change in policy and practice since the end of apartheid, including new forms of access for historically excluded groups, yet also much ongoing challenge and contestation (Nyamnjoh, 2012; Lockett, 2016). Yet across these countries, questions over who should be targeted varies and there are ongoing struggles over which groups become visible or invisible through different policy discourses.

Policy and practice relating to widening access are often associated with social justice but is commonly underpinned by meritocratic notions, for example the premise that initiatives should provide access to higher education to all who can benefit from it, regardless of social background. Research on HE has shown that it is a changing landscape reshaped by globalization, diversification and neoliberalism (Burke et al., 2017). Projects of access and accountability are increasingly shaped by these forces, with neoliberal commitments in particular creating the new conditions of HE differently in each social context. This ‘neoliberalisation’ of HE is an ongoing intensification of a strong valuing of individualization, choice, market security and minimal government (Slaughter and Leslie, 1997). It is also an intensification of embedding forms of power guiding people to orient themselves toward entrepreneurial and competitive dispositions. These orientations then support efforts to privatize and deregulate, rebuilding and blurring notions of ‘the state’, ‘the market’, ‘public’ and ‘private’ (Ball, 2012). The intensification of neoliberalism is important because, despite a perceived increase in institutional autonomy, these commitments to open markets, free trade, reduced state intervention and the value of increased competition work directly to shape approaches to access and accountability taken up in contemporary HE (Savage et al., 2013).

HE policies across many national contexts now prioritize the development of human capital and a highly skilled workforce to create competitive knowledge economies in the wake of deindustrialization in the global north. Access becomes linked to the imperative of national economies as its primary aim (Olsen and Peters, 2005). With the massification of HE, huge levels of growth in participation over many decades and a shift away from an elite system, access and the attendant accountabilities are reconstructed as about “the numbers”. As more students enter higher education, there is greater attention to financial considerations which has led to increasing student fees. As this has happened, HE has been seen largely in terms of individual investment, rather than broader notions of HE for the public good, and this has placed emphasis on individual choice, responsibility and reward. The idea of students as consumers has grown to shape the HE policy and practice landscape in many contexts, with students from disadvantaged social groups positioned as vulnerable or weak consumers in need of special support via commodified systems. This has tended to rationalize student fees in terms of the financial return to the individual graduate, where participation in HE is often portrayed as primarily a project of self-investment. This is used to justify moves toward charging student fees as an important aspect of providing a form of access, with claims often made of positive ramifications for social justice. Increasing student numbers, and therefore growing the market of higher education, is also seen as generally desirable by some policymakers as the funding of HE has shifted from public investment to provision through individual student fees (Carpentier, 2012).

¹The six equity groups are: People who identify as Aboriginal and/or Torres Strait Islander; People who are from low SES backgrounds; People with a disability; People from non-English speaking backgrounds; People from regional and remote areas; and Women in non-traditional areas. These groups are currently under review.

Fees and funding

Access agendas are entangled with wider HE reforms that play out differently in varied national contexts, with different implications for questions of accountability. However, the overarching forces driving change across different national contexts tend to be characterized by globalization and neoliberalism, with significant shifts toward market-based approaches.

Strong market-based systems blur the lines of accountability for access, locating it largely in the “choice” of the individual. It has been argued that the market system of HE operates most strongly in the United States (US). Financial aid is a major strand of policy approaches relating to access and participation in the US with extensive numbers of undergraduates requiring scholarships to afford the high cost of HE study (Mohrman, 2009; Zaloom, 2019). The preference for scholarships is driven by moves toward a market system and the race for HE institutions to be positioned at the higher ranks of university league tables. Merit-based financial aid has been identified as a strategy to support institutions to attract those students with strong academic records or those seen to have specific athletic or musical abilities. Students tend to opt for the institution offering the highest amount of financial aid even if that university or college is not their top choice. The process escalates as students seek larger scholarships and institutions spend more in the competition to select those applicants seen as most desirable or most deserving.

In the UK context, discourses relating to widening access were explicitly drawn on to create support for the reform of student fees from 2012 to 13 onwards. Those HE institutions wishing to charge home/EU students more than £6000 per annum became locked into a system for the control, accountability, and regulation of access-widening activity. A tie-in between permission to charge fees above the £6000 baseline and efforts to widen access and boost participation constituted a financial control mechanism for national government to steer HE at a distance, with the capacity to determine, through regulation, how access was enacted. In the UK, access-related activity is tied to government performance indicators, creating a form of accountability at the institutional level. Responsibility for strategies relating to access and participation funding in England is with the Department of Education through what was the Higher Education Funding Council for England (HEFCE) and the Office for Fair Access (OFFA). In 2018, HEFCE and OFFA became the Office for Students (OfS), with the remit to “put students at the heart of higher education”. The Department of Education as the ministry responsible for HE, sets high level policy and decides on access and participation funding allocations, which are then distributed by the OfS. In addition, HE institutions are required to use a portion of fees charged over the baseline to support student access, success and progression by developing dedicated infrastructure and activities. This needed to be evidenced within the institution’s “Access Agreement”—detailed institutional plans approved by the non-departmental body responsible for safeguarding “fair” access to higher education in England. As a regulatory body, OfS has powers to fine a university or suspend part of its grant if it deems an Access Agreement unacceptable. A refusal to approve an Access Agreement would prevent the institution from charging above the baseline fee. Overall, institutional expenditure on this area has been shown to vary greatly, as does the design and implementation of access-related activity. A new but similar regulatory system in the UK has recently come into place with “Access and Participation Plans”, which are monitored by the OfS to ensure that HE providers meet the commitments made to students in their plans. The plans must set out how the HE provider will improve equality of opportunities for underrepresented groups, including a vision for change, and the investment that will be made to reach this desired change with specific targets identified.

There is an ongoing policy tension between HE institutional autonomy and demands from policy and funding bodies to develop forms of accountability around access agendas. For example, there is increased pressure to develop “better” monitoring, evaluation and regulation of activities designed to expressly widen access to HE in the UK context. For instance, measures were taken in 2014 to ensure that HE institutions moved away from using additional fee income to provide financial support directly to students in the form of bursaries and/or scholarships, and toward investment in infrastructure and activity designed to support student access, success, and progression through an emphasis on the entire student lifecycle. This was justified as the deferral and income-contingent character of student loan repayment with the aim that no-one is excluded by virtue of financial circumstances from participation in HE. Rather, efforts would be directed at providing quality advice, guidance and information to potential students from underrepresented groups and then supporting them practically to progress and succeed through and from HE. Since 2014, there has also been greater attention to evaluating and demonstrating evidence of outcomes. Initiatives such as the HEAT (Higher Education Access Tracker) and the NERUPI partnership (Network for Evaluating and Researching University Participation Interventions) are products of such attention. At times, tense debates circulate regarding which approaches and methods are best suited to understanding these educational dynamics, leading to a challenging environment for notions of accountability around this policy and funding to hold together in any coherent way.

In Australia, Denise Bradley delivered a major federal review of HE in 2008 with an explicit policy focus on setting the target of 20% of the student body to be composed from low socioeconomic status backgrounds and 40% of 25–34 year olds to hold a bachelor-level qualification by 2020. Funding was provided to support the deregulation of the HE system with the aim to create more undergraduate places. To complement this new “Demand Driven System”, the Higher Education Participation and Partnership Program (HEPPP) was introduced in 2010 as an annual fund given to universities to increase the participation of students from low socioeconomic status backgrounds, and to develop partnerships with local schools, vocational and educational training (VET) providers and other universities to develop initiatives that supported the intention of the policy. A National Priority Pool (NPP) was also part of this policy suite, offering grants to support the development and implementation of initiatives and to develop an evidence base to guide the emerging field. Research in the Australian context has uncovered

how the responsibility and benefits of access and participation related work has shifted toward a market-based system as in the US and UK. Australian student fees for home/domestic students vary across HE institutions but are largely subsidized through the Higher Education Loan Program (HECS-HELP) for what are known as “Commonwealth Supported Places” or CSPs. To be eligible for HECS-HELP a person must be studying in a CSP as an Australian citizen who meets the residency requirements or a New Zealand Special Category Visa (SCV) holder or permanent humanitarian visa holder and meet the residency requirements.

Recent years in Australia have seen increasing uncertainty in relation to access and participation agendas as a conservative Liberal/National Party coalition government introduces new national HE reforms, making the field a precarious one for those tasked with managing this area of university responsibility. In late 2020, the “Job-Ready Graduates” package passed federal parliament. Australian HE was already amid a crisis brought on by the global coronavirus pandemic. With the sharp decline in international student enrollment in the Australian sector, a major income stream for universities, Australian HEIs were already facing dramatic restructuring to make up what amounted to a significant financial shortfall. The job ready graduate reforms were an extensive re-shaping of the way particular degree areas would be funded, attempting to direct student participation toward areas of nation-state productivity. An important aspect of these reforms is a move toward what has been termed the IRLSAF (Indigenous, Regional and Low SES Attainment Fund) which will fund universities to support Indigenous students and students from low SES and regional backgrounds. The establishment of this fund, which will incorporate HEPPP, is part of a growing focus on regional, rural and remote students as part of the access and participation agenda in Australian HE. The reforms have experienced extensive critique from many analysts of HE. One area of concern is to what extent Australian “Enabling Programs” (non-traditional, open access pathway programs) will be funded over the long term, despite this providing a major accessible entry route for students from historically under-represented communities.

Accounting for access

Despite the dynamic and contested character of access-related policymaking outlined above, the funding explicitly identified for access and widening participation requires clear lines of accountability to ensure appropriate use of these precious resources. Access and participation activity occurs however at the nexus of a complicated mix of social processes, governmental responsibilities, and value-systems that are guided, often implicitly, by the framing of the purpose of HE participation. This has led to contestation over the different perspectives regarding the purpose of HE participation, framed differently as they are by commitments to social justice, social diversity, social mobility, meritocracy and neoliberal perspectives, among others (Whitty et al., 2015). The framing of the reason to invest in access and participation comprises markedly different activities related to the macro and micro contexts in which the activities are designed. Examples include building partnerships between local communities (often with a focus on schools) and the university, with activities designed to “raise aspiration”, outreach programs that focus on advice, guidance and information about how to access HE, various scholarship schemes and student support activities such as counseling, study skills and peer mentoring (Bennett et al., 2015). Over time, and with some critique of the focus of these activities on “the problem” of access and participation as being outside of the HE context, there have been increasing efforts to create inclusive curricula and teaching practices with a focus on supporting student retention, completion and success. An increasing concern has been to invest funding in larger scale and more diverse programs of evaluation to ensure that the use of funding and resources are appropriate, effective, with efforts to understand “what works”. Yet this particular aspect of what might be considered accountability has largely focused on dominant perspectives of the purpose of HE participation, with evaluation often ignoring marginal value-systems altogether. Instead, evaluation is often designed to consider only that which is easy to measure (Harrison and Waller, 2017). This primary accountability focus of evaluating the “measurable” has been critiqued as decontextualizing the programs or community members involved, and/or ignoring the complexities involved in understanding why something “works”, for whom, over what duration, and why (Burke and Lumb, 2018).

If accountability in this context is to be taken seriously, it is important that increased attention is given to the methods by which resources and opportunities can be differently targeted to those who have suffered long-standing forms of social, educational and economic inequality. This has been described in research as a key opportunity of access and participation efforts through processes of redistribution, pushing beyond dominant forms of accountability toward an ethical responsibility of HE to redress historical exclusions and injustices. Research in this area has pointed to a tension requiring careful consideration when developing approaches to targeting resources toward groups or individuals. This tension lies in the requirement to identify the “appropriate” target groups (i.e., those who have experienced social disadvantage and inequality) while simultaneously avoiding constructing classifications that reproduce derogatory depictions of groups through deficit discourses (including flawed assumptions that the problems lie in a form of lack within those groups being targeted by access and participation activities). Some have referred to this as a process of misrecognition that distorts the framing of the challenge of access and participation through a lens of deficit (Burke, 2012). Misrecognition contributes to processes that objectify, dehumanize and/or homogenize people and groups through instruments of classification and categorization. Finally, if we are to grapple with the notion of accountability in relation to access and participation, we must consider questions relating to social power, influence and decision-making. Representation of the issues at stake by those in

positions of authoritative power lead to a distorted focus on individual attitudes and flawed assumptions of what those targeted by policies lack, rather than on redressing historical, systemic, structural, economic and cultural inequalities that reproduce educational disadvantages despite efforts to widen access and participation. Thus, attention must be paid to the interconnections between redistribution, recognition and representation when considering access and accountability.

Access on the peripheries (of institutions and systems)

Research has shown that work within institutions to build new forms of student access is often peripheral, and that the access constructed is on the peripheries of HE systems themselves, providing limited participation to more elite degrees and/or organizations (Burke, 2012). Concentrated work attempting to build access for historically underrepresented groups is not commonly seen as “core business” and tends to be located at the peripheries of institutions rather than the project of access being embedded in institutional structures and practices. In countries where there is dedicated national funding, specialized units, centers or departments emerge at HE institutions with professional staff responsible for developing new strategies, infrastructure and activities that aim to facilitate the intended access and participation outcomes. In this way, access and participation can be relatively detached from the main focus of universities (Jones and Thomas, 2005). This dramatically reduces the potential for institutional, structural, and cultural change. Furthermore, the new programs and practices designed are often different in each HE institution with vastly variable staffing profiles, initiatives, and general resources. Clearly it is important for initiatives seeking to engage and redress historical underrepresentation to address the specific local conditions in which the work is situated, yet the structures in place have implications for the representation of access and participation issues across the institution, the status of initiatives and the persons and groups held accountable. This has implications too for the quality of material and opportunity made available to students and communities. Units located more centrally within institutional structures and hierarchies carry status and authority in terms of strategy and investment in agendas for creating greater equity of access and participation, compared to units with little influence on senior level decision-making. Furthermore, the peripheral positioning of access units and programs, and the notion that the responsibility for access and participation efforts lies with units outside of academic faculties, can mean that practices of teaching and research are disconnected from these efforts. This has implications for developing new knowledge and broader expertise across the domains of higher education (e.g. research, teaching, curriculum development, assessment, admissions, student support), limiting opportunities to build embedded institutional approaches whereby agendas relating to equity, access and participation are held as a responsibility of all staff members. This kind of ‘embedded’ approach requires however close attention to institutional structures which are historically and socio-politically formed, and it is an approach which must include capacity to support high quality professional development across the institution for understanding of the issues relating to organizational and community contexts. This approach also requires carefully developed governance structures and evaluation methodologies.

Governance and evaluation

Access and participation agendas have produced significant government investment and national campaigns, yet there remains a lack of research investigating governance of these agendas and related questions of responsibility and accountability. Scholars of HE have argued that the limitations of current governance and management necessitates developing more effective structures and practices, particularly in when it comes to establishing more equitable systems of tertiary education. Countries such as Australia and England for example have established policy frameworks yet stark disparities of access and participation endure within and across nation state systems. In many contexts there are calls for rigorous evaluation approaches to understand the impact of different access and participation structures and activities, and whether current governance arrangements are appropriate. For example, scholars in the South African context have advocated for more sophisticated frameworks of evaluation in higher education that are capable of engaging deeply embedded historical inequality structures (Bozalek and Leibowitz, 2012). Many institutions consistently fail to meet benchmarks despite regulatory mechanisms and qualitative research highlights that the structures, activities and support that seek to redress inaccessibility are highly variable in terms of quality across institutions, regions and localities.

Due to the paucity of research regarding how and with what effect access and participation efforts are governed, structured and supported, precisely how allocation procedures operate and what forms of resource accountability there are at the institutional level is largely unknown across the sector. It could be argued that there is insufficient oversight into questions of to whom or to what institutional policymakers are accountable when deploying these public resources, although this varies across different nation-state contexts. There is a scarcity of analysis in terms of, for example, how the stratification of HE institutions maps onto policy and practice and how that differently (and potentially unequally) impacts on local and/or regional underrepresented communities across the wider sector. Relevant data is collected through different bodies but rarely combined, analyzed or presented in a coherent manner. This points to a need to develop ethically formed and contextualized research and evaluation methodologies that can generate richer understanding of access and participation patterns to inform structures and practices across local, regional, and national scales.

Surrounding access and participation agendas there is a problematic “politics of knowledge” that tends to endlessly foreground the historical prominence of dominant social groups. This dynamic plays out in a myriad of ways, some of which is explored in the next section of this entry relating to “Epistemic Access and Accountability”. One way this problem plays out though is in a medical, clinical, and experimental mode of knowing that has come to colonize evaluative research in relation to educational effectiveness. Randomized control trials (RCTs) have in many contexts been turned to as a potential evaluation approach in the context of understanding “what works” when it comes to access and participation investments and initiatives. This has however been extensively critiqued as not even remotely fit for purpose (Gale, 2017). RCT research design pays scant attention to context and is ill-suited to understanding how social inequalities operate in relation to education due to a distorting emphasis on cause and effect. RCTs are unable to shed light on how students make choices and decisions, develop their sense of aspiration and capability, experience themselves as learners, feel inspired, excluded or valued. Students do not choose to study simply through “rational choices” but are guided by an array of different circumstances and experiences within their lives that escape simple metrics and measurements (Brynin, 2012). Lived experience of inequalities and exclusions cannot be measured, nor can the pleasure of learning or the sense of belonging. These require methodologies that can generate insight beyond that which is readily observable and/or reducible. Evaluative research must therefore attend to relational, dynamic, contextual and embodied dimensions of education and engage the complex formations that develop the potential for parity of participation in HE. Without methodologies that enable a form of critical analysis, the reduction of evaluation surrounding access and participation agendas to methods of measurement is likely to reproduce representation of inequalities through instruments that effectively divide, measure and classify. If the notion of access is to hold the possibility of transforming HE systems and institutions toward more inclusive and just patterns and arrangements, evaluative research needs to be led by the perspectives of those whose judgments and values have historically been disregarded or under-represented. This will ensure that the assessment of what is valuable about access and participation is not simply an ongoing reflection of those in relatively privileged social positions.

Epistemic access and accountability

The concept of access is primarily defined to mean “formal access”, i.e., being granted means to formally enter a higher education study pathway leading toward a formally recognized qualification. These qualifications follow national guidelines, and thus curriculum are composed in accordance with national regulations, policy and expert bodies. A student granted access will meet a series of academic basic requirements that will have been attained in previous education. However, HE scholars have continued to draw attention to forms of access beyond this rigid definition. The formalized means of assessing potential HE candidates upholds a restrictive understanding of personal ability and aptitude. This produces extremely narrow conditions for entry that can be leveraged through privileged access to social networks and services to effectively “game” HE access.

In contrast, many potential students have not had the same level of access to resources, including money, tutors, networks, support and time for building the basis to respond to traditional access criteria. Even though globally there have been shifts in the make-up of student populations on the basis of previously ‘under-represented’ groups (such as along ethnic, gender and class lines), there has been little shift in what constitutes legitimate knowledge, skills and attributes to be granted access. The denial of formal access for disadvantaged groups is thus on the basis of lacking the narrow forms of “cultural capital” deemed appropriate for competence within the forms of knowledge that are seen as legitimate within higher education. Even countries with a sustained agenda for widening formal access have largely ignored questions of the criteria used to determine who has the appropriate academic capability. Moreover, as mentioned above little mapping has been completed to understand the relationship between access criteria and assessment and the distribution of access to elite institutions.

A further and connected issue of access is what is often referred to as epistemological or epistemic access. Starting with Morrow’s (2009) concept of “epistemological access”, HE scholarship has extended its focus from formal access to consider what forms of knowledge and knowledge production are being accessed. Higher education disciplines contain what can be called “systematically organized knowledge”. Epistemological access is seen to be divided by contextual knowledge and theoretical knowledge. Contextual knowledge is understanding the facts of knowledge as they exist and pertain to specific real-world situations. Theoretical knowledge refers to understanding the way that information and data has been collected and collated, and the often-unwritten normative rules that allow for recognizing historical processes of producing knowledge and for assessing new claims to knowledge (Muller, 2014: 262). This then provides access to the production of knowledge, and to assessing claims to knowledge specific to a discipline.

Epistemic access has been signaled as a concern in the movement of higher education toward outcome and employment as the basis of curriculum design. Many authors have argued that policy emphasizing outcomes at the expense of theoretical knowledge is changing what is being accessed within higher education (Shay, 2013). Outcome focused HE (such as in policy like the Australian Job-Ready Graduates Package, DESE, 2020) risks producing new divides in HE between those who are trained only to put knowledge into practice, and those who can make claims to knowledge. This is an important way in which inequalities are perpetuated, as epistemic access has historically run across gender, ethnic and class lines (Wheelahan, 2012).

This leads into a broader question of epistemic monism and pluralism. Higher education contains a series of disciplines that are tightly defined ways to produce knowledge. These typically maintain a monopoly over the legitimate knowledge pertaining to an area of study. These disciplines have a colonial history that stems from Europe and now extends globally in the recognition of its claim to legitimacy. Because of this, many knowledges and ways of knowing have not been sanctioned as legitimate higher

education knowledges. This raises the question of the legacy of colonialism on the consecration and codification of Western knowledges while denying knowledges, or even producing “epistemicide” (Santos, 2014) of knowledges from Indigenous groups and the global South.

Calls for change in who is given epistemic validity, and how this is sanctioned and valued, have become increasingly prominent. For example, in South Africa the Rhodes Must Fall Movement has underlined the need to adopt different curricula, pedagogy, symbols and institutional structures that incorporate a broader array of different epistemologies. These calls see claims to diversity and inclusivity through practices like representation as achieving very little in providing access for other ways of knowing. Providing a decolonial approach to epistemology and curriculum requires the dismantling of the universal/monopolizing claims to knowledge that higher education disciplines maintain, opening the space for an epistemological plurality in how forms of knowledges are legitimated (see Mignolo, 2007, 2011; Escobar, 2010).

Conclusion

Widening access and participation has been a key theme of higher education policy over many decades, with an explicit policy focus in some parts of the world. Although the concept of access is contested, the policy and practice of widening access and participation is increasingly driven by the forces of globalization, neoliberalism and marketization. Furthermore, policy interventions have involved both fiscal and human investments and have raised complex challenges for issues of accountability. Who determines how funding is allocated? What methods are used for the distribution of resources and who decides? Who is accountable for the methods by which funding is allocated? Who is held accountable for the effectiveness of the use of funding? Who gains epistemic access and whose knowledges count? These questions are challenging for higher education institutions and governments and have been considered in different ways, including through evaluation and measurement instruments. Increasingly, where there is specialist funding attached to widening access and participation, higher education institutions are being required to evaluate the effectiveness of their activities as a regulatory measure of accountability.

Introduction

Concern about student completion rates is relatively recent in the history of higher education (HE) and tends to be associated with an expansion in undergraduate student participation. As the proportion of a nation's population studying for a bachelor degree increases, so too does concern about suboptimal rates of completion, or what some pejoratively refer to as "drop out." It has become a particular concern for OECD nations (OECD, 2019a). The context is important for understanding why.

Since the mid twentieth century, a defining feature of higher education systems of the global north¹ has been the steady increase in their student numbers, particularly undergraduates. Trow (1974, 2006) characterizes the phenomenon as a shift in student participation from elite to mass to universal levels. For example, in Germany there were 836,002 students studying for a university undergraduate degree in 1975, increasing to 1.74 m in 1990 and to 2.9 m in 2020 (Óhidy, 2018; Statista, 2021). Illustrated in these figures is that the rate of HE's expansion across most of the global north gathered pace early in the 21st century. For example, in Australia the number of undergraduate students in the 10 years from 2010 to 2019 increased by about 30% or an additional 183,410 students (DESE, 2020).

Initially—in the mid to late twentieth century—much of the increase was prompted by an "unmet demand" for HE by "baby boomers" who were predominantly middle class (or aspiring) and while they qualified for university entry, there were insufficient places and/or the funds at their disposal were inadequate to secure their participation (Gale and Tranter, 2011). Over time, governments in the global north have sought to rebalance HE demand and supply through the introduction of a range of measures, including: financial support to enable participation by students with minimal financial means; increased funding for universities to grow the number of student places; building new universities and repurposing other tertiary institutions as universities, thus creating more university places; and extending HE provision to include bachelor and associate degrees at vocational tertiary institutions, although uptake of these has been relatively slow (Knight et al., 2021).

Justification for implementing these measures has often been couched in terms of social justice and "fairness" (Rawls, 1999). At first, at least in some jurisdictions, these were coupled with a Keynesian economic logic; that is, meeting current social demands, financed on the expectation of future economic growth. Later, the national cost of expanding HE provision was offset against expectations of "social mobility" and other individual benefits associated with obtaining a bachelor degree, for which students were obliged to financially contribute, often through schemes that deferred payment until graduates secured paid employment (Gale and Parker, 2018). The latter was framed by a neoliberal logic, which also informed the ambition of nations in the global north to become leaders in a competitive global knowledge economy (requiring an investment in human capital), to rival the global industrial economy in which their dominance had begun to dissipate. Thus, while social justice often featured in the rationale for HE's expansion, it was nonetheless secondary to economic and political considerations.

This was evident even in programs ostensibly aimed at increasing participation by under-represented groups. Widening Participation (WP)—as the strategy became known in the UK and which is now the term that tends to be used more globally—became more prevalent mid to late in HE's period of expansion (1960s–2020s), resulting in increased numbers of students from low socioeconomic-status (SES) backgrounds and from other marginalized groups taking up university study. In some jurisdictions, the proportion of these students studying HE also increased. For example, in England in 2014/15 there were 159,015 students enrolled in HE from the most deprived backgrounds, representing 17% of all undergraduate enrollments, which increased to 191,305 or 19% of enrollments by 2019/21 (HESA, 2020, 2021). Similarly, in Australia, from 2010 to 2019 the number of university students from low SES backgrounds increased by 33% (33,165 students), compared with the 30% increase in all university students (DESE, 2020).

¹In a similar manner to how Connell (2007) uses "global north" to signal the dominance or centrality of particular (academic) cultures in the realm of knowledge, we use the term to refer to nations that are more centrally located in global fields of economic and political power, rather than to their respective geographical locations. For example, while Australia is geographically located in the global south, it is more closely aligned with the economic and political interests and influence of the global north.

However, the driver for this growth in the proportion of HE students from under-represented groups was predominantly economic. This was most evident in Australian HE following the Global Financial Crisis (GFC) of 2007/2008, when the government introduced what became known as a “demand-driven system” (Australian Government, 2009). Australia was one of the few global-north nations not to experience a GFC-induced recession, placing it in a strong position to invest in HE provision (among other things). Such investment ushered in the nation’s “fourth wave” (Gale, 2021) of WP differed from previous government interventions in that instead of responding to unmet demand, it “sought to create demand [particularly among under-represented groups] to meet ambitious (and eventually unachieved) HE participation targets” (26). Pre-GFC, other global-north countries held similar aims (e.g. in England, a target of 50% was set for 18–30 year old HE participation by 2010)—with WP seen as a major strategy to achieve this—with the view that HE’s “contribution to the economic and social well-being of the nation is of vital importance” (DfES, 2003: 10).

It is this context that frames student completion rates in higher education in the global north. As more students have entered higher education, including more from disadvantaged backgrounds, completion rates—or, more specifically, rates of non-completion—have increasingly been described as a problem. In one illustration of this, in 2013, Jan Truszczyński, Director-General of the European Commission’s Directorate-General for Education and Culture, observed that:

Currently too many students in the EU drop out before they complete their higher education degree. Students from a lower socio-economic background and other disadvantaged groups are the most likely to drop out. This is a problem across the EU.

Truszczyński (2013: 7).

Responding to such assessments, the following problematizes simple accounts of “dropping out” as problem. This is not to suggest that non-completion is nothing to worry about, but rather we identify problems with: the characterization of non-completion, in ways that tend to benefit some institutions and social groups more than others; the location of the problem within student groups with higher rates of non-completion, rather than in institutions and systems; the assumption that 100% completion is the only positive outcome so that all non-completion is regarded as negative for students, institutions and systems; and the limits on comparisons of student completion rates across institutions and systems, given their different definitions, parameters, options and societal expectations of HE student completion. As well as identifying these problems with the problem (of non-completion), we conclude that non-completion might not be the problem imagined if less emphasis is placed on what institutions and systems lose by way of non-completion and more emphasis is placed on the benefits of HE from the perspective of students.

We begin, though, with how “drop-out” has been conceived as a problem and, because of its construction, the solutions that it suggests.

The completion problem for particular students and institutions

With HE student numbers rising, particularly as a proportion of the wider population and particularly including students from disadvantaged backgrounds, two concerns have been raised by conservatives. Reasons for their concern is a perceived threat to HE’s quality (i.e. an assumed lowering of academic standards in order to facilitate the entry and progression of the less able) and/or the financial and emotional distress experienced by students (especially from groups most likely to drop out), who fail to meet HE’s high standards and subsequently fail to complete, which could have been avoided if they had not been granted access in the first place.

These concerns tend to be most prominent among high-status higher education institutions (HEIs) and conservative media. The general tenor of the complaints is that it is unfair to enroll students who performed poorly in school, i.e. typically students from disadvantaged backgrounds. To do so is “setting them up for failure” (Cervini, 2012, in Gale and Parker, 2017), causing unjustified heartbreak as well as creating additional expense for institutions (Gale and Parker, 2017). The argument is that it would be unrealistic to expect these students to be sufficiently prepared or capable for the rigors of university study: “He or she didn’t do well at school, so why is higher education going to be any different?” (Hare, 2015).

These are claims based on an apparent correlation or association between students from low SES backgrounds and their comparatively high rates of non-completion or attrition. Yet closer examination of the data often reveals that in HEIs where the retention of students from low SES backgrounds is lower, retention for all students is also lower, suggesting that the assertion *low SES = high attrition* is more complex than it is often made out to be (Gale and Parker, 2017). With the evidence not matching the claims, resistance to higher levels of low SES enrollments might be interpreted as prestigious institutions seeking to maintain their status and distinction (cf. Gale, 2021), to differentiate themselves from other HEIs with higher rates of low-SES participation. This was exemplified in 2009 when the then Executive Director of Australia’s “Group-of-Eight” universities, Michael Gallagher, branded recommendations to expand participation in HE as “a drift to mediocrity,” and reasserted the need to maintain a stratified system in which elite universities can focus on “achievement of research excellence” (Gallagher, 2009, in Gale, 2011: 13).

A second set of explanations for the non-completion problem has led to a different set of solutions. Faced with what HEIs perceive as an ever-growing cohort of under-prepared students, equity practitioners have devised a range of support measures to assist students with their “transition” (cf. Gale and Parker, 2014) into and beyond the 1st year of HE study. A key premise of

this approach is that “access [to HE] without support is not opportunity” (Tinto, 2008). That is, it is not sufficient to merely expand access to HE to disadvantaged and other marginalized groups; there needs to be a high level of coordinated support to ensure that students can appropriately adjust to university life and be inducted into institutional ways of studying and being (Gale and Parker, 2014). Indeed, institutional support to aid retention and completion is increasingly seen by the European Commission (2015) as essential.

There are several broad groups identified as needing support in the 1st year and beyond:

- Those from disadvantaged groups (such as low SES students and minority ethnic groups) that are traditionally the focus of widening participation initiatives; with students from low SES groups regarded as the most likely to discontinue their studies (Quinn, 2013).
- Students from diverse groups who are not necessarily associated with WP. Indeed, “drop-out” is not always neatly associated with WP policies in European nations, instead often attributed to a “lack of attention to diverse student needs” (Quinn, 2013: 58; European Commission, 2015), reflecting a “more general experience of difficulties in making sense of HE” (Ulriksen et al., 2017: 56).
- First year students in general (e.g. Kift et al., 2010). Some consider that simply being in the 1st year of HE study equates to membership of an “equity group.”

What these have in common is the perception that HE students associated with population groups most likely to drop out, need extra support not provided by traditional HE pedagogies and curricula. Throughout the UK, Europe, the USA, and Australia, academics and equity practitioners champion and implement a range of support structures aimed at enhancing student engagement, to help integrate students into, what is for them, an alien culture of higher education and to ease their transition (Zepke, 2021; Tinto, 1993; Gale and Parker, 2014). The nature of the support and engagement varies from context to context, but includes efforts to increase the cultural capital of students from non-traditional backgrounds (e.g. Thomas, 2002; Zepke, 2021), providing institutional information, and offering additional tuition to enhance academic skills (Thomas, 2021).

These approaches to support and engagement are largely “bolt on” strategies, in that they are in addition and separate from mainstream HE curriculum, pedagogy and assessment. Equity practitioners and sympathetic academics have also developed what they term a “whole of institution” approach to improving retention and completion, particularly among those from non-traditional backgrounds. In these approaches, the institution is required to provide embedded, consistent and targeted support that engages with the needs of a diverse cohort.

This whole-of-institution approach includes changes to admission processes, modified modes of course delivery, flexible organizational structures, and re-timetabling of courses (Thomas, 2021). In terms of strategies aimed directly at students, the so-called “transformative” approach includes more student-centered pedagogies granting better access to the curriculum, direct learning support, co-curricula activities, making explicit the hidden curriculum of HE (e.g. Thomas, 2021).

However, despite being described as “transformative” and “whole-of-institution” (Thomas, 2021; Kift et al., 2010), these approaches tend to leave HE’s existing ways of learning, dominant forms of knowledge and epistemic hierarchies unquestioned.² In short, they aim to “mediate diversity”; i.e. compensate for or overcome students’ differences from the norm. There is little to no recognition of students’ backgrounds and living conditions as sources of valuable knowledge rather than mere impediments’ (Rios-Aguilar and Kiyama, 2018: 5; see also Moll et al., 1992) to learning and success in HE.

The completion problem for particular higher education systems

As well as locating the completion problem in particular student groups and HEIs, supranational organizations (such as the EU and the OECD) also attribute completion problems to particular HE systems. But there are problems with such comparisons, even with the creation of measures for comparison such as a degree’s “theoretical duration” (TD). Table 1, derived from recent OECD (2019a,b) reports, is a good example of the differences and the problems such data present for meaningful comparisons.

Reporting 2017 data in columns two and three, the Table purports to provide a comparison of HE degree completion rates in OECD countries.³ The problem with the data becomes apparent the more one delves into their points of comparison. For example, included in the Table are all graduations from cohorts that commenced a bachelor degree, even if the qualification obtained was not the same as the bachelor degree they commenced.⁴ These can still be regarded as completions given that the students were neither still studying nor did they withdraw. Contrary to concerns noted above of the problems of under-prepared students and their potential for non-completion, the more general point is that non-completion—whether that relates to the degree in which a student was

²For critiques of these, see respectively Gale et al. (2017), Connell (2007) and Bernstein (1999).

³Note that the OECD (2019a) report does not include all OECD countries, only those with available completion rate data.

⁴This includes “short cycle tertiary” programs that extends to those transferred to/graduated from master’s or doctoral programs, as well as those that transferred to a “master’s long first degree” (e.g. an undergraduate masters) (OECD, 2019a: 227). These amount to a very small proportion of students and but also represent system differences in terms of what is transfers between programs are possible and permitted in a given system (e.g. undergraduate masters programs do not exist in Australia, while transfer to an Further Education college is possible in England).

Table 1 Degree completion rates in selected OECD countries, compared with PISA 2018 scores in reading (by social background) and the score difference between least and most disadvantaged students.

Country	Completion rate by the Theoretical Duration (TD) 2017	Completion rate by the Theoretical Duration plus 3 years (TD+3) 2017	PISA 2018 equity in reading by social background classification	PISA 2018 reading score difference between advantaged (top quarter) and disadvantaged (bottom quarter ESCS)
United Kingdom	72	85	Around OECD average	80
Ireland	63	81	Better than OECD average	75
Lithuania	61	65	Around OECD average	89

initially enrolled or that no qualification was awarded at all—can result in positive outcomes for students. Representing all non-completion as a problem effectively imposes institutional and system interests onto students.

An examination of student completions in UK⁵ HE systems provides a further example. These data show that the UK appears to fair quite well in terms of student completions when compared with other OECD nations, with 72% of the cohort graduating within the TD of their undergraduate degrees (3 years in England, Wales and Northern Ireland; four in Scotland). Whereas Switzerland appears to have significantly below average student completion rates. However, when the time taken by HE students to complete their degree is extended to the TD of their degree plus 3 years, the UK (with an 85% TD+3 completion rate) is much more on a par with other nations. By the same metric, Switzerland has an 81% TD+3 completion rate even though its TD student completion rate is comparatively low. The data suggest that when provided with more time, most students within a system do graduate. Perhaps more time spent in HE allows for more support although the reasons are likely to be more complex.

Indeed, explanations for differences between completion rates within TD and TD+3 are difficult to pin down, partly due to the enormous variation between HE systems in OECD nations. For example, because of privacy laws, German universities do not track the progress of individual students but only record progress at a cohort, year or degree level. Thus, they are less able to identify students in need of support before they drop out. A less specific reason for TD/TD+3 differences in Table 1 countries might be that less flexible systems—for example, those that mandate completion within a set period, or those that limit the amount of “time out” that can be taken as leave from study—might require students to complete sooner. Similarly, nations that charge relatively high tuition fees, or those that have dramatically increased their fees, incentivize students to complete sooner. This may go some way to explain why the UK has a very high completion rate within a program’s TD, with annual tuition fees of around £9000 for English universities. The change in approach to fees in England—before 1998 no tuition fees were charged; at their introduction they were a modest £1000 increasing to £3000 in 2006, and then rising dramatically to the present £9000 in 2012 (Riddell et al., 2018)—might influence how students now perceive the costs of prolonging their studies or of not completing at all. Yet, high

⁵The UK does not have a unified HE system but four systems, one in each of its four nations, which is not reflected in the OECD data. Granted, the systems in Wales and Northern Ireland are small and tend not to vary greatly from what occurs in England. HE in Scotland probably differs the most: with four-year undergraduate degrees the norm and fee-free student tuition, it is larger than Wales and Northern Ireland combined, and older, with several of its universities predating most in England. Grouping them together in the data as one system might be convenient, but it is also illustrative of the larger problem of making country comparisons.

tuition fees and student loans in the USA (as onerous as they are) have endured for decades, without a comparable effect on student completion rates (see [Table 1](#) for USA TD and TD+3 rates). And, if tuition fees do influence student completions within a degree program's TD, what is the effect on the accuracy of reported UK completion rates, of combining England and Scotland HE systems when Scotland does not charge fees for undergraduate courses?

Another possible explanation for differences in HE student completion rates relates to the extent to which OECD nations' schooling systems are equitable. The OECD's PISA (Program for International Student Assessment) measure—of 15-year-olds' ability to use their reading, mathematics and science knowledge and skills to meet real-life challenges—uses the term “equitable” to refer to the distance between the highest performing 15-year-olds and the lowest performing, within a schooling system. The smaller the score difference the greater the equity in the system; the greater the score difference the greater the inequity of a system.⁶ We might surmise that in more equitable systems, school students who perform at the lower end of recorded PISA scores have acquired more of the “cultural capital” privileged by schooling ([Bourdieu, 1986](#)) than students within less equitable school systems, and this is thus more likely to translate to higher student completion rates in HE. In columns four and five, [Table 1](#) includes this PISA data for *reading* by students' social background classification, for each of the country HE systems compared by the OECD. Also included are PISA score differences between the top (most advantaged) quartile, and the bottom (least advantaged) quartile. It is 2018 data, illustrative of PISA assessments generally recorded in these countries in the 2010s. According to the data, the least equitable schooling system in [Table 1](#) is Israel, with 121 points difference between its highest and lowest PISA scores, along with a below average equity score in reading. Yet its HE system has relatively high student completion rates in HE. Conversely, Estonia has a more modest 59% HE student completion rate (even after TD+3) but has the most equitable schooling system of all nations listed in the Table (with a 61-point difference between the most and least advantaged students). In short, PISA data do not appear to be predictive of HE student completion rates and do not appear to be a good indicator of school students' levels of accumulated cultural capital, which would contribute to their HE completion.

Reimagining the problem

What stands out in the “solutions” above is the superficial, narrow, reductive constructions of the completion problem. These are largely built on comparisons and assumptions about students, degrees, institutions and systems informed by limited and sometimes questionable data about “the other,” particularly data that appear to be comparable (e.g. when the same terms are used but they mean different things to different people in different contexts or when variables are standardized in order to shoehorn data into a form that allows for their comparison). As we have suggested, the reality of non-completion can be quite different and far more complex.

To reiterate, non-completion can be a positive outcome for the student who decides mid-stream to switch from a teaching to a journalism degree, or a necessity for the student whose personal circumstances require them to commit their time to doing other things (e.g. secure paid employment; care for a family member; etc.) and so on. Students are not all the same; one set of circumstances and how students respond to them are not representative of all. Even when non-completion constitutes “failure” in HE terms, that is not always a bad thing; it can lead to considerable reflection and personal growth. It becomes more of a problem when particular kinds of students—i.e. population groups—are over-represented in non-completion statistics. It is exacerbated when the problem is attributed to the population group rather than to institutions and systems.

Similarly, degrees do not differ just in relation to their duration. They also vary in the transfer options available to students and in the fees students are charged for undertaking a degree. Perhaps more importantly, degrees vary in form and function ([Gale, 2021](#)): what is valued within the degree, how that is represented, what participation looks like, and what the degree's purposes are. To complicate this further, the form and function of degrees vary *within* disciplines, institutions and systems as well as *between* them. Degrees are not all the same and the student experience of undertaking a degree is not uniform. Consider, for example, the cohort mentality (e.g. “the class of 2025”) culturally instilled in HE students in USA HEIs, particularly in prestigious Ivy League universities and the Association of American Universities, which creates a “completion ideation”: i.e. a “psychological contract” ([Argyris, 1960](#); [Rousseau, 1989](#)), a commitment to one another, facilitating completion.⁷ This is quite a different way of being a HE student compared with some other HE systems. For example, compare the different expectations and experiences of HE students in England and Australia. In the transition from school to university, the majority of Australian HE students tend to continue living in the family home, commuting to their HEI on a daily basis. Whereas in England, especially for the middle classes, part of the university experience is to leave the family home and set up accommodation close to one's HEI, sharing house or university student “dorms” with one's peers. It is a rite of passage that goes hand in hand with the school-university transition. These comparisons contribute to a broader understanding of HE students “navigating change” ([Gale and Parker, 2014](#)), though not always in the same way.

In a further comparison, juxtapose the psychological with the “social contract” ([Rawolle, 2013](#)) of HE, between student and institution/system/nations, which purports to offer students who complete their degree with certain benefits: e.g. social mobility; better employment opportunities and conditions, including higher than average wages; better than average health and life

⁶These are relative assessments of system equity rather than an absolute measure of equity comparable across nations.

⁷We are indebted to Lizzie Knight for her observations of cohort mentality, psychological contracts and completion ideation, and how these play out in different HEIs and systems.

expectancy; and so on. Indeed, several HE systems justify their student fees based on these promised benefits (e.g. the rationale for differential fees in Australian education until 2020; Gale and Parker, 2018). Increasingly, though—especially for “late-comers” (i.e. marginalized groups)—the “democratization” of HE (i.e. WP) delivers a “blighted hope or frustrated promise” (Bourdieu, 1984: 150). Whereas students once entered university with “high hopes of what the knowledge economy has to offer, fueled by the expansion of higher education ... the labor market cannot keep pace with social expectations of work, rewards and status” (Brown, 2003: 150). There is no longer certainty that a simple undergraduate degree offers a positional advantage. With the social contract between HE student and institutions/systems/nations undermined, incentives to complete are diminished.

Yet even to broaden out understandings of HE completion, to complicate things, to include what it means for students (not just for institutions, systems, nations), does not delve deep enough into why non-completion has become a problem in the first place. The place to begin that investigation is from the perspectives of students, especially those from disadvantaged, marginalized groups. Instead of explanations for why some students drop out and what can be done, we should be asking why students would *want* to participate in HE, what is in it for them not just what is in the national interest, and what HEIs and systems can do about that. This is more than just including explicit accounts of how to engage with HEIs, how to negotiate their systems and cultures, what to do to be successful, to complete. Those are supports essentially framed by the interests of HEIs and their systems.

The disjuncture between what HEIs want (high completion rates) and what some students experience (an alienating HE) could be likened to what Connell (2007) refers to as power relations in the realm of knowledge; center-periphery relations between global north and south. Even with all the support, with a whole-of-institution approach, students from marginalized groups can feel as though they are not wanted, that to stay means to reject their own cultures and histories. Indeed, for these very reasons some young people decide not to participate in HE at all. Drawing on Sen (1999), Watts and Bridges (2006: 287) observe that some young people “reject HE because it does not enhance their freedom to lead lives that they value and have reason to value.” That is a reasonable position to take but it also conveniently leaves HEIs and their systems without the need to change very much. Instead, what if HE *did* enhance students’ freedoms to lead lives that they value and have reason to value, not just for mainstream students but also those from disadvantaged backgrounds? What if HE afforded them a compelling reason to participate? That would require HEIs to focus on what students are participating in; what the HE equity literature describes as a concern for “access to what” (Gale, 2011).

If we were to focus on that, perhaps HE student completion wouldn’t present as such an issue.

Acknowledgments

Thanks to Laela Adamson for chasing up the data for the Table and her related contributions to our thinking. Thanks too to Lizzie Knight for her reflections on psychological contracts in the context of HE student completions. Of course, responsibility for any shortcomings in the essay remains with us.

Introduction

My original intention when I began this chapter was to use Butler's (1990) notion of performativity to interrogate the ways in which women academics perform gender in higher education institutions. In *Gender Trouble*, Butler (1990) questions whether, "if gender is constructed, it could be constructed differently, or whether its constructedness implies some form of social determinism, foreclosing the possibility of agency and transformations" (pp. 10–11). The question she poses rests on the recognition that "there is no gender beyond the expressions of gender" (Butler, 1990, p. 34); that identity is constituted through performativity, that is, "a set of repeated acts within a highly rigid regulatory frame" (Butler, 1990, p. 45). My intention was to use the data collected from interviews with twenty South African women academics to examine how, if at all, women academics were performing gender in ways that sought to champion and/or change their epistemological, ontological and gendered occupation of higher education institutions. But as I worked through an extensive literature review, I found myself embedded in narratives of exclusion, inclusion and seclusion that permeated the journeys of women's presence in higher education institutions. Given the demands of a handbook to be all-embracing, I opted instead to pursue a literature review that focused on the leitmotifs of exclusion, inclusion and seclusion that repeatedly rear their heads in the literature. In making this decision, I doff an apologetic hat to Butler¹ and the women I interviewed, whose stories I shall tell in a different setting.

Structural framework

I begin this review with an affirmation of my political positionality as a feminist black² woman researcher from the Global South. I identify standpoint theory and intersectional feminisms as foundational heuristics that guide my positionality. In this context I make an unapologetic decision to foreground literature about women academics from the Global South. I use the term Global South as a metaphor for underdevelopment which "marks a shift from a focus on development or cultural difference to an emphasis on geopolitical power relations" (Dados and Connell, 2012, p. 12).

I then provide a brief description of the concepts of inclusion, exclusion, and seclusion which serve as broad thematic frames in the literature on women in academia. I show that inclusion and exclusion are used to illustrate that while women are unequivocally *in* higher education, they remain largely *out* of positions of power. I show that acts of seclusion are used by women and institutions as strategies to blur or conceal aspects of women's gendered identity, for example of motherhood, and gendered experiences, for example of sexual harassment, at universities.

Guided by the broad frames of inclusion, exclusion, and seclusion, I identify three prominent themes in the literature on women in academia. The first is that women academics have staked an unshakable and permanent place in academia. The second is that

¹In doffing my hat to Butler, I pay respect to the importance of Butler's notions of performativity but also recognize that it will not adequately serve the purpose of this article. Instead, I plan to return to Butler when I write the stories of the women I interviewed.

²I purposefully use the term black women and women of color interchangeably as a linguistic strategy of inclusiveness. The choice of identifying as a black woman or as a woman of color is arguably rooted in one's own political positionality and context. Given the broad scope of this review, I do not choose a single descriptive term. Suffice to say that I self-identify as a black woman, knowing full well that other women may not perceive me as such. My upbringing and identification in the anti-apartheid struggle as a black woman is a political position that is irrevocable. I also use the terms interchangeably as a form of respect to the writing being referenced at any given point in the review. Simply, I echo the term that author being reviewed uses. I acknowledge that both terms offer limited markers of marginalization and that women's experiences of marginalization is complex, multi-layered and contextually nuanced.

their absences in positions of leadership, in research, in the professoriate and in selected disciplines, persist. The third is the competing demand of work and family responsibility. It is arguable that these themes have validity for all women academics, irrespective of race, class or location in the Global South or Global North, albeit to varying extents and ways. However, being a black woman in academia is imbued with its own challenges. I therefore focus on some of the specific challenges experienced by black³ women academics. In the wake of Covid 19, I examine women's responses to the inescapable condition of working from home. In the final section I provide brief examples of women academics' strategies to build their careers and claim professional authority.

The politics of being a feminist researcher

This review is guided by two mutually supportive heuristic frames, that of standpoint theory and intersectional feminism. Fundamentally, Harding's (2004) standpoint theory is rooted in the idea that the standpoint of women is not simply a different perspective from that of a normative masculine world, but that it is a perspective that is imbued with particular moral and political commitments and that everyday experiential accounts of historically marginalized people are a legitimate site of scientific knowledge. Collins (2004) fortified the notion of marginalization through her focus on women of color, albeit, in the main, a focus on African American women. Intersectional feminism extends standpoint theory in that it acknowledges and addresses the differences between women. Davis (2008) argues that the strength of intersectional feminism is that it has been "devoted to understanding the effects of race, class, and gender on women's identities, and struggles for empowerment. It has especially been concerned about the marginalization of poor women and women of color within white, Western feminist thought." Furthermore, intersectional feminism's embrace of postmodernism provides the opportunity to welcome the notion of "shifting and multiple identities" (Davis, 2008, p. 71). In sum, my political positions shaped by, inter alia, my location as a black feminist from the Global South, are etched in this review, consciously or unconsciously, informing the inclusions, exclusions and seclusions I opt for.

As a feminist researcher I accept few certainties. One of them is that research is never innocent or apolitical. As an intersectional feminist and a black from the Global South, my research will always be driven by these immutables. Simply, I rely on Davis's argument that one's feminist location(s) is an analytic resource, not just a social marker. (Davis, 2008, p. 72), I contend that my location in the Global South is an analytic resource that is instructive of how I tell the story of women's exclusion, inclusion and seclusion in higher education.

As an intersectional feminist from the Global South, I am painfully conscious that, globally, research about women frequently tacitly and explicitly excludes women of color and women from the Global South. These are not innocent mistakes or accidental exclusions. I do not expect all research about women to be inclusive of all women, nor do I suggest that this is feasible. However, in my experience, I find that the research produced and published in the Global North, with a few exceptions, makes little to no effort to include research from and about the Global South. Those of us in the Global South have to find our own ways of talking and thinking about how to find a fit for ourselves in this world that consistently excludes us. For example, I was excited when I saw the title of a doctoral thesis: "Women being and becoming academics: exploring gendered career journeys and their implications for career development."⁴ It seemed to have strong resonance with my research and I was eager to read a study about women's academic journeys, only to discover that the study was of five women academics in the United Kingdom. The lure of inclusion implied in the title took me to the same old place of exclusion. The racial identity of participants is not offered which left me believing that they may well be white, given the established normativeness of whiteness and the otherness of being black.⁵

In their study of articles of women in higher education in 15 selected education journals published between 2000 and 2013, in Australia, the United Kingdom, Europe and North America, Cama and Jorge (2016) identified four themes. The first was aimed at analyzing sex differences in faculty tenure and promotion, the second examined women in higher education leadership and management, the third was related to gender earning gaps, and the fourth was linked to policies aimed at promoting gender equity. The journals selected were exclusively from the Global North and provided no recognition of the challenges experienced by women from the Global South. Despite the probability that there may well be several points of resonance and recognition between women from the Global South and North, the disparity in geopolitical power relations and knowledge production meant that women from the Global South were left to fend for themselves to find resonances in a study that explicitly excluded them.

Over the years experiences of exclusion have become a familiar and I have to constantly caution myself to expect less. Simply, unless research consciously signals that it is inclusive of women from the Global South or about women of color, it is rarely about us.

It is in this context that I make a clear political decision as I write this chapter: that is, to make every effort to foreground research produced by the Global South about the Global South. I believe it is time for the Global North to make its own efforts to find resonances with the Global South. As an intersectional feminist, it is my responsibility to disrupt established, invidious and entrenched norms of disempowerment. I argue that research that fails to pay even scant attention to writers of the Global South is a conscious act of disempowerment. In so doing, I contend that the scope of intersectionality should extend beyond the commonly held

³I use black women here to refer to all women of color. I note that not all women of color describe themselves as black women.

precepts of race, class, age, gender, sexuality and religion to include the vast differences in access to knowledge and knowledge dissemination between the Global South and the Global North. Therefore, this review is written with a disruptive imperative in mind and seeks to denounce the seeming innocence of the literature review as a guileless description of relevant writings.

Having said that, I am keenly aware of the limitations of the political imperatives I have set for myself. The literature from the Global South referred to in this chapter is predominantly African with a disproportionate focus on South Africa. Despite an extensive search of relevant journals published on the African continent, the literature about women's successes, resistances and challenges in higher education is scant. For example, the last 10 issues of the *International Journal of African Higher Education* do not contain a single article about women academics on the continent or in the African Diaspora.⁶ Indeed, there is a remarkable absence of research about gender in journals that do not, by definition, focus on gender, implying that gender is a "separate" issue meant only for journals about gender.⁷ I rely extensively on the *South African Journal of Higher Education* (SAJHE), owing to its education focus and the inclusion of research about gender from across the continent, albeit dominated by research about South Africa. Publications emanating from non-English-speaking countries in the Global South were not accessible to me.

The review below is therefore undertaken with the "political and moral commitment" (Harding, 2004, p. 1) to foreground the literature from the Global South. In so doing, it pays homage to intersectional feminism (see Davis, 2008) alongside standpoint theory (see Harding, 2004).

Conceptual clarity

Inclusion and exclusion are familiar concepts that have been used extensively to illustrate that while women are unequivocally *in* higher education (inclusion), they remain largely *out* of positions of power (exclusion). The notion of seclusion is one that I introduce⁸ here. I use seclusion to refer to the ways in which women choose to hide or offer only partial glimpses of their coping strategies and/or gendered identities as they perform and/or disrupt the gendered behavior patterns expected of them in universities. Expressions of seclusion are evident when women academics choose to hide their family responsibilities in the workplace, in their silences about the trade-offs they find themselves making as they try to be caregivers and professionals, and when they pretend they don't have children, or stop breastfeeding too soon, or never say no when given unreasonable workloads relative to the men at the same level (see Bassett, 2005; Connelly and Ghodsee, 2011; Moe, 2003; Ward and Wolf-Wendel, 2012). Hudock's furtive way of surviving academic motherhood is a telling expression of seclusion: "The ivory tower seems to have no room for children or grocery shopping or laundry. I remember the feeling of being caught by students in the act of grocery shopping, and they were always surprised that I eat. Imagine if they saw me breastfeeding" (2009, p. 63).⁹ Seclusion of her gendered identity as a mother and the expression of discomfort at being "caught" in the act of a being a 'normal' person, reveals the extent to which women hide/seclude themselves in order to survive in academia.

A different example of seclusion is illustrated by a common theme in the study of academic mothers in India, Brazil and South Africa (Pillay et al., 2017). Almost all the women interviewed were at pains to distance themselves from aspirations to climb the academic ladder or even to name themselves as academics. Instead, they foregrounded their motherhood and presented their academic selves as secondary, incidental or accidental.

The stories of these academic mothers suggest that adopting a demure stance towards scholarship, while relishing its potential for empowerment, is a coping strategy and a means towards legitimizing their enjoyment of work, especially in the face of social expectations that they should be mothers above all else ... they downplay their academic aspirations, suggesting that they are not "really academics" and frequently expressing their desire to be good mothers. Muting their academic selves, while expressing the importance of their motherhood, may serve as a way to lessen the guilt and potential social censure

(Pillay et al., 2017, pp. 176–177).

The women in the study chose seclusion, consciously or unconsciously, of aspects of themselves as a strategy to manage the gendered demands of home and work, and the social and cultural expectations implicit in their contexts. In Pillay et al. (2017) the social and cultural expectations of women from India, Brazil and South Africa is given significant attention. Despite localized nuances, there was broad recognition that women were expected to primarily to be caregivers, homemakers, and mothers, that professional responsibilities were secondary to these, that she was expected to marry, to be actively engaged in extended family events and to observe traditional responsibilities allocated to women. Smith (2011) describes similar cultural expectations of Latina women. It is arguable that in the context of these social and cultural expectations women academics obscure/seclude their professional ambitions while vocalizing their family responsibilities, as strategic devices that deflect attention from their professional selves. Such deflection also provides space to enact their professional selves without drawing attention.

⁶(see <https://ejournals.bc.edu/index.php/ijah/issue/archive>).

⁷I undertook an extensive review of *Agenda*, the first feminist journal in Africa, and *Feminist Africa*, another feminist journal on the continent, but found no recent articles relevant to this chapter.

⁸To the best of my knowledge the concept has not been used to describe women's engagement with higher education institutions.

⁹See also Robinson and Clardy (2010), Smith Silva (2011), Connelly and Ghodsee (2011), Ward and Wolf-Wendel (2012).

Institutions, too, perform acts of seclusion when they hide salary disparities between male and female academics or when they pretend that the playing field for woman and male academics is even or when they refuse to admit that academic fathers do not go home to the same responsibilities that academic mothers do (American Council on Education, 2018; Cama and Jorge, 2016; She Figures 2021; UNESCO, 2021).

Institutions practice acts of seclusion each time they hide acts of sexual harassment and violence against female staff and students. Focusing on the European context, Bondestam and Lundqvist show that “precarious working conditions, hierarchical organizations, a normalization of gender-based violence, toxic academic masculinities, a culture of silence and the lack of active leadership are all key features enabling sexual harassment” (2020, p. 397). In an online study of over 16,000 university students in the United States, Wood et al. (2018) show that 19% had experienced sexual harassment from staff and 30% from peer perpetrated harassment. In their research that focused on public affairs education programs, Young and Wiley (2021) show that 13% of women experienced sexual harassment at the hands of faculty. In April 2016 the #EndRapeCulture protest spread across South Africa in response to, inter alia, repeated and increasing levels of sexual violence against women at universities (Gouws, 2018; Orth et al., 2020). A common theme across these articles is that universities continue to remain complicit in silencing, secluding and obscuring acts of sexual harassment and violence.

I suggest that exclusion, inclusion and seclusion are not mutually exclusive but that they function as mutually constitutive, occurring simultaneously in the lives of women academics. I therefore do not structure the chapter into neat sections on exclusion, inclusion and seclusion. Instead, I suggest that the fluidity of these concepts, alongside the experiences of the individual woman academic, should encourage women academics to construct their own meanings, interpretations and instances of exclusion, inclusion, and seclusion.

Looking back

Within the above political framework of foregrounding the Global South that I set for myself, albeit imperfect, I opted to first provide a brief overview of the trajectory of the literature about women in academia. I begin this section by establishing the progress women have achieved in their representation in higher education. I then focus on two key pervasive challenges: their absence from positions of leadership, and the challenges implicit in the competing demands of family and work. I rely on the research I have conducted and my extensive engagement with a literature base that extends beyond the Global North, to identify the key issues, albeit not exhaustive, discussed in this review. I then examine the additional forms of exclusion that black women in academia experience. I follow this with a brief overview of the impact of Covid-19 on women academics. In the final section of this literature review, I identify research about women’s resistance to established and entrenched tropes of disempowerment.

In but still out

The global literature of the last five decades on women in academia offers a traceable track, arguably kicked off by a focus on the absence of women academics in the historically male-dominated and masculine environments that define universities. From the groundbreaking research produced by Acker in the 1980s and ’90s and Simeone,¹⁰ there is now a plethora of literature that tracks the presence of women in universities that have for centuries been an enclave of men, where knowledge production and dissemination actively excluded women (see Elsevier, 2020; She Figures, 2021; Squazzoni et al., 2020; UNESCO, 2021).

Today, it is unequivocal that women have staked their place in higher education: in 2018, women represented 43% of teachers in tertiary education globally (UNESCO, 2021, p. 25). However, despite their significant numeric presence in universities, women comprise only 30% of the world’s researchers at universities (UNESCO, 2021). Table 1 shows the regional distribution of women researchers in 2017.

The lower number of women researchers correlate with their lower representation in the professoriate given the higher value placed on research for promotion. Lower research outputs may be attributed to women academics’ dominance in teaching forward positions that overwhelm the space and time for research. The high value placed on research and the devaluing of teaching for promotion, suggests that the returns to women academics for the extensive time devoted to teaching, is small, and makes no significant contribution toward their career development (Krebsbach, 2022). That outcomes for women academics, in the form of promotion is improved when teaching and research carry equal value for promotion is borne out by research conducted by Subbaya and Vithal (2017). In a study of promotions at a South African university where teaching and research have been equally evaluated, they found that “although more men applied for promotion¹¹ ... the overall success rates for women were higher, [and that] there were no statistically significant differences in the success rates between males and females”. They also show that “there was an

¹⁰See Acker (1980), Acker (1994), Simeone (1987).

¹¹In research not yet published I found that women academics are often hesitant to apply for promotion and doubt their promotability. A female colleague that I mentored was surprised when I suggested she apply for promotion and noted that none of her line managers had suggested she apply. She applied and was successful. The literature on the value of mentoring for women academics is extensive. For example, see Vongalis-Macrow (2014) Career moves: mentoring for women advancing their career and leadership in academia.

Table 1 Women researchers by region, 2017

<i>Region</i>	<i>% of women researchers</i>
Central Asia	48.5
Latin America and the Caribbean	45.8
Arab States	40.9
Central and Eastern Europe	39.0
North America and Western Europe	32.9
Sub-Saharan Africa	31.1
East Asia and the Pacific	25.0
South And West Asia	23.1

Extracted from [UNESCO \(2021\)](#), p. 22).

overall equitable outcome at the level of full professor where excellence in teaching and research were compulsory for success” (944–945).

The UNESCO publication (2021) referenced above also shows that women are underrepresented in senior positions; are over-represented among teaching staff; that STEM (science, technology, engineering and mathematics) fields are heavily skewed in favor of male academics; and that, on average, men publish more articles than women, especially in high impact journals.¹²

There is clear consensus in the literature that although the number of women academics in higher education has increased significantly in the last two decades, women remain a minority at universities, and they continue to populate the lower levels of the academic ladder. There is also consensus that the masculine monopolization of academic leadership and professorship persists.

In South Africa, although the number of women academics in the system has increased substantively in the last five years, they constitute the largest portion of temporary staff at the lowest levels of the academic ladder while professorships remain largely male (*VitalStats*, 2016).

In 2019, there were twice the number of male professors than female professors (down from three times the number in 2010). The difference in the number of male (4018) and female (4668) lecturers in 2019 is not significant, suggesting that the number of males and females at the starting block of lectureship may be similar but men reach the “finish line” of professorship more speedily than women. So, while entry into academia does not appear to be the stumbling block for women academics, progress through the system is. Of the 26 public universities in South Africa, four are headed by women, one of which, the University of Cape Town, is the highest ranked institution on the continent (*Mail and Guardian*, 20 August 2020). In 2019, 46% of professors in Brazil were women, and in India 27.3%, while in Australia only 33.9% of people holding positions above senior lecturer were women. In Canada, women are near parity at all academic levels except professorship (*UNESCO*, 2021, pp. 25–27).

According to *She Figures* (2021), which tracks gendered data in the European Union (EU), despite targeted policy initiatives “the under-representation of women in senior academic and decision-making positions in the EU continues to be a significant issue” (p. 7). According to *She Figures*, in 2019 women comprised 42.3% of all academic staff, 26.2% occupied senior positions and 47.1% were in junior positions.¹³ Put differently, the percentage of women academics at the lowest levels is almost twice that of women academics at the highest levels. The report shows that women comprise only 26% of Grade A positions, that is, the most senior academic position (p. 176). In STEM fields the number of women at Grade A level is 19% (see also *Morley*, 2013; *Redmond et al.*, 2017; *Subbaye and Vithal*, 2017; *UNESCO*, 2021).

In a study commissioned by the British Council, *Morely and Crossouard* (2015) investigated the presence/absence of women in positions of leadership at universities in South Asia (Afghanistan, India, Nepal, Sri Lanka, Pakistan, and Bangladesh). Not surprisingly, the study found that although there is a vast increase in the number of women graduating from higher education institutions, the number of women in academic leadership positions remains miniscule. The study found that socio-cultural issues like family responsibility and cultural norms about the role of women was a key factor that contributed to the absence of women leaders. In a study that included 40 participants from South and East Asia, the Middle East, North Africa, Australasia, and Europe, *Morely* (2014) points to the perception among women academics that women, if they are leaders, are often responsible for internal affairs like teaching support and men are better suited to managing external affairs. So, even when women are leaders, what they lead may also be determined by perceived gender differences.

The global data with respect to women academics in senior and leadership positions are rarely racially disaggregated. For example, *She Figures* (2021) and the *UNESCO* (2021) report offer gender disaggregation of the data but no race profiles of the data provided. Given the geographic focus of these reports, it is likely the data with respect to women refers mainly to white women. Data on the inclusion and exclusion of black women in leadership is usually to be found in publications that focus specifically on black women. For example, the *American Council on Education* (2018) report, “Voice from the Field: Women of Color Presidents in

¹²See also the *Elsevier* (2020). *The researcher journey through a gender lens* for a more detailed gendered analysis of, inter alia, research output, grants, scholarships and patents. It should be noted that although the publication is signaled as a global report, no African countries are included and Japan is the only Asian country included. These exclusions are by virtue of the methodological decision to focus on countries had a defined number of active authors in the selected time period 1999–2003 and 2014–8. The presentation of the report as a global report is therefore misleading.

¹³*She figures*. <https://op.europa.eu/en/web/eu-law-and-publications/publication-detail/-/publication/61564e1f-d55e-11eb-895a-01aa75ed71a1>.

Higher Education”, indicates that in 2016 only 5% of college and university presidents were black women. In 2014, 26% of college and university presidents in the United States were women (of all races) (see <https://www.forbes.com/sites/lucielapovsky/2014/04/13/why-so-few-women-college-presidents/?sh=593aa2466bcf>).

Women students’ access to higher education echoes similar patterns to those of women academics. Globally, the number of female undergraduate students has exceeded that of males since 2002. (UNESCO, p. 13).¹⁴ However, this phenomenon of the “female advantage” excludes STEM fields and ceases at the level of postgraduate study. Except for Central Asia, globally there are far fewer females than males at doctoral level. In South Africa, in 2019, only 3% of all African women enrolled in higher education were registered for Ph.D. study, as opposed to 4% of all white women. The fact that African women comprise more than 40% of the South African population and white women only 5% of the population illustrates the stark racial divide in female student achievement in higher education in the country.¹⁵

The American Council on Education reports that since 2006, women have earned more than 50% of all doctoral degrees in the country but in 2015 comprised only 32% of full professorships at degree-granting postsecondary institutions.

In sum, although women have staked an unshakeable claim to a place in higher education, their access to senior academic and leadership positions remains small. So, while women are unequivocally *in* higher education, they remain largely *out* of positions of leadership and power. Additionally, unless stated otherwise, discourses about women in higher education is implicitly about white women from the Global North. Put differently, white women from the Global North are more *in* than black women and women from the Global South. The challenges of entering and staying in higher education are different for black and white women. So, too, is their challenge in striving for and succeeding in leadership.¹⁶

The mirage of work/life balance

Alongside the recognition of the increased presence of women at universities and their absence in leadership positions, the literature on the challenges and obstacles experienced by women in academia is also substantial. Perhaps the most commonly cited challenge is the impossibility of balancing work and family demands, what Morley (2013) refers to as being “caught between two greedy institutions – the extended family and the university” (p. 122). The limitations on career development imposed by family demands, especially, but not only, in culturally restrictive contexts and for women of color, has begun to take a firm seat in the literature on women in higher education (see Hunter and Leahey, 2010; Jay et al., 2010; Motherhood Initiative for Research and Community Involvement (MIRCI), 2003; Mudaly, 2015; Obers, 2014; Pillay et al., 2017; Toffoletti and Starr, 2016; Wolfinger et al., 2008; Zulu, 2011).

The impact of family demands on women’s academic careers is deep seated. In a study of 14 women academics at Rhodes University in South Africa, Obers found that “the most productive male authors far exceed the most productive women in terms of quantity of peer reviewed article input” (2014, p. 1109), a trend that is also evident in other parts of the world (UNESCO, 2021; She Figures, 2021). Obers shows that, not surprisingly, the women in the study were adamant they *chose* to prioritize their family responsibilities over career development. The women involved in Pillay’s study (Pillay et al., 2017) made similar assertions. Toffoletti and Starr (2016) point to the myth of free choices that “women academics may cling to in an effort to minimize their discomforts and frustrations”. Specifically, they point to the

... power of work-life balance discourses to craft female academics as self-realizing agents who shoulder the responsibility for successfully managing the domains of work and life. [These discourses] also expose the discursive power of the concept to reinforce structurally embedded gender inequalities by masking the institutional forces (such as increased workplace demands and performance expectations ...) that impact the seemingly free “choices” work-life balance policies “empower” women to make

(Toffoletti and Starr, 2016, p. 490).

Toffoletti and Starr argue that discourses surrounding work-life balance are deeply gendered and that, in the main, women academics find this balance impossible to achieve. The literature is replete with research that bears testimony to the inevitability of failure as women academics persist in the futile search for balance between work and family responsibilities while simultaneously feeling crushed by guilt for not giving enough to either (see Connelly and Ghodsee 2011; Evans and Grant, 2009; Pillay et al., 2017; Ward and Wolf-Wendel, 2012). In the conclusion of *Academic Mothers*, Pillay asserts that “feminism needs to renounce the very idea of balance It [predicts] an evaluative frame within which we measure ourselves daily and constantly and inevitably fail. For as long as we describe women’s efforts at mothering and working as a balancing act, we are complicit in sublimating our efforts to a discourse of dysfunctionality” (2007, p. 148). Following this, the plethora of literature that focus on the impossibility of balancing work and family life reaffirms the assertion that the search for balance is a key culprit in perceptions of ‘failure’ and guilt that all too often accompany women to and from work every day.

¹⁴The sub-Saharan (SSA) region, where there are 73 females enrolled for every 100 males, is the only exception.

¹⁵Data extracted from South African Higher Education Management Information Systems (HEMIS) obtained from the national Department of Higher Education.

¹⁶For an evocative exploration into this difference, see Smith and Nkomo (2021).

In their study of women in postgraduate study in STEM subjects in 17 African countries, Fisher et al. (2020) showed that getting married during the Ph.D. reduced women's publication productivity but increased that of men, and that becoming a parent during the Ph.D. was a key reason that women took longer to complete the Ph.D. Similarly, Zulu asserts that "the gender productivity gap still remains because of the time woman would have lost in their early years of childbearing. Male academics' productivity is largely not affected by child-rearing and related responsibilities" (2013, p. 758). A recent study in Rwanda exposed the challenges of pregnancy, family and motherhood for women academics and students. For some, pregnancy signaled an end to future education, while others chose to hide their pregnancies or the fact that they were mothers (<https://www.universityworldnews.com/post.php?story=20210627165955830>).¹⁷

The last decade has seen an increasing focus on the competing demands of motherhood in the Global North. Two persistent challenges are pervasive in North American publications on the theme of motherhood and work. The first is the challenge of child-care (Bassett, 2005; Connelly and Ghodsee, 2011; Moe, 2003; Ward and Wolf-Wendel, 2012). The Organization for Economic Cooperation and Development (OECD) statistics indicate that the United States is the only high-income country in the world that does not mandate paid maternity leave,¹⁸ nor does the federal government support any form of public childcare options beyond limited tax credits (Miller, 2021). Miller (2021) points out that in Denmark, a two-year-old is guaranteed a place in a daycare center and parents will pay a maximum of 25% of the cost, whereas in the US parents have no guarantees and will pay full cost, estimated at around \$1100 per month. Connelly and Ghodsee (2011) observe that many women academics find themselves making a choice between opting out, childlessness or delaying childbirth to the point of infertility: "Although women have been making steady advances in the academy in the last three decades, scholarly life in the United States is still a deeply masculinist culture; there is a continued expectation that professors are not the primary caregivers to their children" (2011, p. 5). *Mama Ph.D.* (Evans and Grant, 2009) is replete with stories of women who opted out of academia, largely as a result of the impossibility of managing work and family responsibilities.

The second, not unrelated challenge, is the grueling path to tenure. Ward and Wolf-Wendel draw attention to the tenure clock, established as the first seven years of academic life, which is "tuned to men who are presumed, ideally, to have no outside interests or responsibilities such as family, and is often in direct conflict with female clocks" (2012, p. 41). The clash between the tenure clock and the biological clock of childbirth is one that Connelly and Ghodsee (2011) also address as they interrogate decisions to delay or opt out of childbirth.

What is evident in this section is that family responsibilities, childbirth, childcare, domestic responsibilities alongside work responsibilities is a global challenge for women academics. While national, local, cultural and traditional contexts have an impact on how this challenge plays out in each woman's life and career, the primary battle between two "greedy" institutions, the family and the university (Morley, 2013, p. 122), is common.

The daily bread of being black in academia

For women of color at universities the challenges are exponentially greater as they battle entrenched and insidious forms of racism alongside entrenched and insidious forms of sexism (Madileng, 2014; Nkambule, 2014). The SAJHE published a special edition on black women academics in one university in South Africa (2014, 28 (6)). In reading these stories alongside those of other black women in higher education, I focus on two commonalities that may be observed. The first is that the pathway to becoming women academics takes many twists and turns, often as teachers in schools, then doctoral students, perhaps back to being school teachers, taking time off for motherhood and then perhaps returning to study or work. In the SAJHE special edition, none had actually planned to become academics. In exploring the experiences of women administrators in sub-Saharan Africa Johnson observes "[e]ach woman, except for one (a nurse) began her career as a teacher" (2014, p. 839). In Pillay et al. study (2017) which spans India, Brazil and South Africa, the constant refrain of having come to academia accidentally is voluble. Similar stories are evident in a study conducted by the American Council on Education (2018), which focused on women of color who are university presidents. The autoethnographic stories told in *Tedious Journeys: Autoethnography by Women of Color in Academe* (2010) recount similar tales of becoming accidental academics after taking convoluted side streets that skirted the borders of academia. The research on black women academics is clear: planning a career is not a luxury available to many black women, especially, but not only, those from the Global South.

A second commonality in the research on black women in higher education is the overt and covert forms of racism and sexism they encounter in their everyday interactions at universities. In the SAJHE special edition, the stories recounted stark and deeply damaging incidents of racism which often took the form of undermining and undervaluing language and research skills, or suggestions of a poor work ethic or even questioning of their intellectual ability, often euphemistically referred to as "not being academically ready". Madileng (2014) talks of her head of department who advised her to pursue studies in Setswana and not English even though she held a degree in Applied Linguistics (English). The fact that her head of department was male constituted a double-barreled attack. Nkambule (2014) recounts how a white female tutor asked her "are you sure you want to do psychology, considering your background?" (p. 2005), and another tutor who asked, "English is a difficult course, are you sure you want to major in it,

¹⁷See the work conducted by the Forum for Women Educationalists (FAWE) a pan-African women's organization with the mission, inter alia, to support girls and women to get an education.

¹⁸See: https://www.oecd.org/els/soc/PF2_1_Parental_leave_systems.pdf.

you can major in Xhosa?" (p. 2005). At postgraduate level she was told "students from disadvantaged backgrounds usually have problems with research because of language" (p. 2006). Botha (2014) says she was told after joining an all-white, mainly female department at a university that "[n]o black person stayed for more than three months" (p. 98). The expectation that she would fail and not cope with the academic rigor that was required, was palpable. The fact that racial denigration of black women academics is widespread is indisputable. Young and Anderson (2021), both women academics at one university in the United States, one white and not in a position of leadership, the other black and in a position of leadership, use the term "microaggression" to describe "brief and commonplace daily verbal, behavioral, or environmental indignities, whether intentional or unintentional, that communicate hostile, derogatory, or negative racial slights and insults toward people of color" (p. 80). (see also American Council on Education, 2018; Robinson and Clardy, 2010).

Alongside the research on black women academics is the research on the experiences of black women Ph.D. students. Loots et al. (2016) show that although the number of black women registering for PhDs at South African universities is increasing, their rate of participation relative to population size is small.¹⁹ The global literature on black women in Ph.D. study offers a core, common acknowledgment: that experiences of racism, alongside the deeply entrenched expectation that black women are nurturers, makes success in doctoral study for black women extraordinarily challenging (see Connelly and Ghodsee, 2011; Evans and Grant 2009; Magano, 2011; Prozesky, 2008; Wolfinger et al., 2008).

The research by black women academics and doctoral students about their experiences in academia is small but growing. Whether they name themselves as intersectional feminists or not, their narratives of racial othering and exclusions add credible weight to the political project of intersectional feminism to interrogate race, class and gender as mutually constitutive sites of marginalization.

Finally, a common thread among women academics, arguably one that transcends race, is the determination to make deliberate choices to use research approaches and methodologies that speak to the ways in which women want to be heard and known, and to use writing strategies that sit comfortably with their sense of self. In 2005, in a reflexive article that used as a point of departure the use of the first person in my Ph.D. thesis, I made the point that the politics of resistance and transformation meant that I did not have the option to find refuge in the anonymity embedded in the term "the researcher" but rather had to confront and center the self if I was to produce trustworthy research (Pillay, 2005; see also Lather, 1996). Today, as I read the stories of women's experiences in higher education, I find strong echoes of similar stances. In the preface to *COVID Diaries: Women's Experience of the Pandemic*, Gouws and Ezeobi (2021) record their indignation at a male colleague who was conducting a survey of women's experiences during Covid-19 and asked "how would *statistics*²⁰ express what we feel?", an indignation also cast upon the absurdity of "men interpreting our experiences for us" (2021, p. vi). A few paragraphs later they make the critical observation that "'giving voice' is a cardinal feminist ideal" (2021, p. vi). I contend that today women academics have authoritatively taken hold of the ideal of giving voice. Research about women, by women and for women bears testimony to this ideal, the foundations of which were laid by the groundbreaking writings of, inter alia, Ribbens and Edwards (1998), Lather (1991, 2007), and Robinson and Clardy (2010).

The curveball of Covid-19

In the context of Covid-19, the legacy of guilt experienced by academic mothers, linked largely to the competing demands of family and work and their absence from home, was violently thrown off course. Guilt associated with not spending enough time with their children and family went out the window. Women academics found themselves at home, with their children, spouse/partner and other family members. The separation of home and work no longer existed²¹; in the absence of childcare and schooling, the increasing burden of household chores and home schooling fell largely on women. Claassens confesses, "I love my daughter ... But I really did not want to be her schoolteacher" (2020, p. 172). In an instant, women became caregivers, cleaners, cooks, and professionals all at the same time and in the same space.

Women also lost the battle for claiming physical workspaces in the home, as men asserted stronger claims over such spaces, often by virtue of their higher incomes, or perceptions that a man's job was more important than a woman's, or just by virtue of being male. Ezeobi says "there were days I sat in my car to grade essays, because I could not do it in my home" (Gouws and Ezeobi, 2021, p. 157). Ironically, while the house and home arena has traditionally been perceived as the domain of women, the onset of Covid-19 saw men usurping this position and staking an assertive claim to a space that historically they have been at pains to distance themselves from. But this prerogative extended only so far as the right to priority over the physical spaces in the house, and not to taking care of the children or other domestic responsibilities (Chitsamatanga, 2021; Stanford University, 2021).²²

Not surprisingly, the impact of Covid-19 on women academics was far greater than that on men. With respect to research output, numerous sources point to the reduced output from women academics, while that of men remained steadfast and, in many

²⁰Italics in original.

²¹At the end of 2020, I was part of a team that interviewed a number of woman students who had applied for a scholarship. One of the questions asked was how she had coped during lockdown. One woman's response was striking. She said that she had always thought that working from home was her ideal. She would be able to take care of her children, work and not feel guilty. She realized soon after lockdown began that leaving home and going to work was important for her own well-being and that she rarely paid attention to what would be good for *her*.

²²Stanford University published a series of articles on the impact of Covid-19 on women academics. <https://facultydevelopment.stanford.edu/diversity-engagement/faculty-networks/faculty-womens-forum/gendered-covid-19-faculty-experiences>.

instances, increased. In a study conducted by Squazzoni et al. (2020), which reviewed all articles and manuscripts submitted to all Elsevier journals between May 2018–20, they found that women submitted proportionally fewer articles than men during the months of the lockdown. Between February and May 2019, women submitted 877,978 and men 1,927,984 articles; in 2020, women submitted 144,978 articles and men 2,519,734. Accordingly, in 2019 men submitted 1,050,006 more articles than women and in 2020, 2,374,756 more. Put differently, the difference between men's and women's submissions pre- and post-pandemic more than doubled. The data collected also showed that the deficit between women's and men's submissions was more pronounced in cohorts of younger women. This finding perhaps signaled that younger women, who were more likely to have young children, bore the brunt of reduced research outputs.²³ In a study conducted in Poland, also part of a geographic region, namely Eastern Europe, that is excluded from "global" literature on women and higher education,²⁴ one male academic whose wife was also an academic said, "my wife's work was compromised ... whereas mine was not affected at all. It even got better, and I could work longer. So my work was definitely prioritized over my wife's" (Gorska et al., 2021, p.11). In the same study, a woman academic without children said that since Covid-19, her research output was "booming", while academics who were mothers not only bore the brunt of responsibility for caring for their own children at home, but also took on the care of their students' well-being. The study reaffirmed the research cited in Gorska et al. (2021) that in times of crisis women take on additional household duties and that men's paid work is prioritized.

The publication edited by Gouws and Ezeobi (2021) is unmistakably a cathartic journey for the women whose voices people the pages of the book. The effects of Covid-19 on cultural, family and individual practices and contexts recounted here signal untold intimate insights that have been rarely heard. The proud cry of "*wathint' abafazi, wathint' imbokodo!*"²⁵ famously ingrained in the nation's history when the women of South Africa marched to the seat of government to protest the imposition of passes²⁶ on African women, took on new meaning for Kunene (2021). She observes "[t]his is something that many black women in South Africa have to do: be rocks and keep it moving. We have to be ... unbreakable rocks that can take incredible amounts of trauma". Kunene realizes that the burden of always being hard and strong, of "packing away her anxieties, trauma ... and keep it moving" was a burden she did not want to bear, and she gave herself permission to do what was good for her, in this instance to be alone. While Kunene chose to be alone, Mpanza observed that social distancing, key to survival during Covid-19, was anathema to her community where social connections were the foundation to survival in apartheid South Africa. She says that "isolation had produced loneliness even in a home full of people" (Mpanza, 2021, p. 80). The stories in this anthology suggest that performances of seclusion, perhaps in the form of avoiding mental health vulnerabilities, or pretending to always be a rock, no longer worked. The women found themselves confronting themselves in ways that they may have previously assiduously avoided.

While the long-term impact of Covid-19 on the careers of women academics is yet to be fully evaluated, there is no doubt that their careers will reflect the burden of this pandemic far more than those of men.

Winning ways

As indicated in the introduction of this chapter, there is extensive literature on the obstacles and challenges facing women in academia, but there is also a small but growing body of literature that speaks to the way in which women academics have succeeded in building their professional careers. I offer two brief examples here.

The first example is that Mudaly's (2015) recounting of her academic journey. She embarks on an intense and exacting process of self-reflection to reconstruct and reshape her professional identity from that of a high school teacher to a researcher at a leading university in South Africa. Like many other black women academics, Mudaly found herself overburdened by a massive teaching load which was exhausting but which played little if any role in transitioning her from a junior academic to a more senior position.²⁷ In other words, teaching, which held little currency for promotion, was her main responsibility, leaving little room for research. In self-critiquing her stance of complicity embedded in her teaching strategies, she began to craft other ways of being and to, inter alia, take a transformative approach to her teaching and to thinking about her career path. She says she consciously discarded pedagogy that was rooted in submission and maintenance of the status quo, a stance that science teachers were trained in, and adopted a transformative and emancipatory approach to her teaching. The confidence she gained as she explored these approaches encouraged her to request a formal meeting with the Dean of Research and to state her case for why she would be a good researcher. She was subsequently invited to serve on a panel that would review research proposals. Her career as a researcher began to take shape. Five years after the publication of the article in which she reflected on her academic journey (Mudaly, 2015), with the encouragement of supportive colleagues, Mudaly was promoted to associate professor.²⁸ In the conclusion to the article she makes two key observations: external recognition of her value was important but so was her own recognition of and confidence in

²³See also: <https://www.theguardian.com/education/2020/may/12/womens-research-plummets-during-lockdown-but-articles-from-men-increase>.

²⁴The authors make the point that literature about women in academia is usually about the United States and Western Europe.

²⁵When you strike a woman, you strike a rock.

²⁶A pass was a document that had to be signed by an employer or other person in authority (usually white) granting permission for an African person to travel from one place to another inside the country. If caught without a pass, African people were jailed. Until 1956, the law applied only to men. The women's protest march to government succeeded in stopping the imposition of the pass law for women.

²⁷See also Subbaye and Vithal (2017) for other examples of women academics similarly overburdened.

²⁸Communication with Mudaly.

her capabilities. In denying practices of seclusion and accepting her aspirations she gave herself permission to advance her academic career.

Using a capabilities framework,²⁹ Loots et al. (2016) identify a number of factors that support black women's³⁰ success in higher education. Key among these is "the importance of acting as an active agent, taking control, standing up for oneself and having a voice" (p. 114). Loots et al. (2016) show that the women in the study began to identify personal capabilities that inspired them to move ahead, to build resilience against institutionalized racism and find value in themselves. They had also built their own communities of support in the face of entrenched institutional obstacles. In commenting on her recent appointment as the first female black Dean of Engineering at the Tshwane University of Technology, Kanakana-Kutamba, born in the Limpopo province where electricity and connectivity are rare, identifies the capability of innovation as a key ingredient of success. She had not planned on academia as a career path but found herself switching from the private sector to a university when she discovered that she enjoyed contributing to the development of young people. In other words, she chose to embrace the activities that gave her joy and to translate this into a career path.³¹

Conclusion

In conclusion, I have attempted in this review to provide a global overview of women academics, academic mothers and students in higher education. As an intersectional feminist I made the decision to foreground literature from the Global South without excluding literature from the Global North. The fact that exclusions from masculine, white, Global North epistemologies and ontologies endemic to higher education institutions are repeatedly performed by women (and men), who continue to perpetuate the normativeness of their places of privilege by the simple, yet powerful acts of exclusion, is disappointing. This review is a small disruption of this practice. I have also made a conscious decision to offer a louder voice to black women, a rare occurrence in the literature that claims to be global.

As a start, I have also introduced the notion of seclusion to, inter alia, understand the ways in which academic women, whether from the Global North or South, adopt practices that keep gendered performativity alive by, inter alia, secluding from ourselves, and possibly from communities and contexts in which we live and work, our own aspirations, capabilities and strengths. Confronting acts of seclusion, evidenced in the frequent silence of universities to sexual violence against women in their institutional spaces, may also be a useful tool for universities to engage with their complicity in repression and oppression.

³⁰The study specifically focused on seven black women doctoral studies. Loots et al. make the point that white women still hold considerable advantage over black women at universities in South Africa. See the data provided earlier in this chapter, showing that, although a miniscule part of the female population in South Africa, there are more white women registered for PhDs (4% of all white female students) than African women, and that only 3% of African women in higher education are registered for PhDs even though they comprise more than 40% of the female population. See also Johnson-Bailey's (2004) research on black women at universities in the United States.

Introduction

While it may differ country to country, we are witness to striking class and gender inequalities across all sectors of education. Our longitudinal research, the *First-in-Family Project*, documented the experiences and identity work of first-in-family students in Australia, a country which has seen recent policy directives aiming to widen participation (Bradley et al., 2008). Despite such efforts, students from non-traditional backgrounds remain largely underrepresented. In the study of equity and social justice in higher education, students who are the first in their family to attend university remain a “critical group for understanding social inequality in higher education and processes of social mobility” (Beattie, 2018, p. 172). As a group, they can often serve as a barometer for the nation’s equity agenda. Social theorists interested in class disadvantage continue to document how first-in-family students access and experience higher education. However, what remains largely unexplored is the gendering of such experiences and how these experiences are informed by institutional cultures and wider societal discourses (see Stahl and McDonald, 2021). As first-in-family students transition to university, we are interested in how gender and class intersect and influence their experience, contributing to the maintenance of their aspirations.

For those who are first-in-family/first-generation, the underlying logic is that the journey through their education will lead to increased opportunities and, thus, allow them to become more socially mobile. However, much of the research concerns the ways in which first-in-family students struggle during the transition into university in comparison to their middle and upper-class counterparts (Pike and Kuh, 2005; O’Shea et al., 2018). Without adequate preparation and support, many first-in-family students may struggle in higher education (Stahl, 2021) and research indicates a high probability of dropping out (Harvey et al., 2017). Recently we have seen a shift in research on first-in-family students which problematizes the first-in-family experience (see Lehmann, 2013) where there are significant variations that need to be acknowledged or what Patfield et al. (2020) call “degrees of being first.” Additionally, research has highlighted how overcoming barriers and traversing higher education as a first-in-family student can increase “grit” and determination (Hodge et al., 2018). In an effort to capture the first-in-family experience, this article focuses on a rather undeveloped aspect of research on first-in-family students, that of gender identity, and how experiences with gender and certain expectations around gender contribute to first-in-family students feeling like outsiders.

Classed and gendered subjectivities during a transitional time

Education systems play a significant role in how students come to understand themselves as gendered (Weiner and Arnot, 1987; Mac an Ghaill, 1994; Francis, 2000) and classed individuals (Reay, 2002; Archer et al., 2010; Stahl, 2014). Studies focusing on class inequality within education draw heavily on sociological theories of social and cultural capital, particularly research exploring how students negotiate pathways and choices within higher education (Kurlaender and Hibel, 2018). Limits in these forms of capital can heavily impact how students from low-socioeconomic backgrounds experience university, which can—and often does—have a significant influence on their sense of identity. Research on how class disadvantage is experienced within higher education remains prominent (Reay, 1998; Spiegler and Bednarek, 2013), yet within the past decade, there has arguably been a decline in similar research into gendered subjectivities in higher education. We do not dispute the ways in which social class structures opportunities and contributes to what is possible (see Stahl, 2020); however, for our purposes, we are interested in how the interplay between class and gender structures the first-in-family experience. Understanding how young first-in-family men and women transition from secondary school primarily requires documenting their shifting, discursive, and intersecting masculine and feminine

subjectivities. We are interested in how such transitions are gendered and classed as well as how they contribute to the formation of aspirations. We now outline recent gender theorizations which have informed how social theorists have come to understand masculinities and femininities in relation to the student experience.

We understand categories of male and female to be binary while gender categories of masculine and feminine are diverse, multiple and overlapping and formed through multiple spaces which are discursive, material, and relational (Harwood et al., 2018). Drawing on post-structural thinking, the subject works toward a particular gendered identity which is continually positioned against, and positioned by, understandings of traditional masculine traits (strong, brave, a leader, stoic) and feminine traits (nurturing, emotionally open, mild-mannered). Bearing this in mind, our research seeks to explore how gendered norms as “socially and culturally produced patterns of language, known as discourses, construct people and the power relationships among them in particular ways” (Francis, 2011, p. 78). These patterns occur both within wider social structures and at a local level. In considering the discursive and relational aspects of gender, Paechter (2002, 2003) contends that we perform gender based on shared understandings of how gendered performances are positioned within different social groupings, referred to as “communities of practice.” According to Paechter (2002), gender is performed through participation in these communities, where it becomes validated. Adding a layer of complexity, Paechter (2002) notes that most people are “simultaneously members of a number of communities of masculine and feminine practice in the different contexts of their lives” (p. 72). During the transition to higher education, many of these localized communities are naturally subject to significant changes where both young men and women—especially those from disadvantaged backgrounds—engage with a wider array of masculinities and femininities.

Adding another dimension, gender scholarship continues to foreground how young people negotiate “the tensions between continuities and social changes” (Arnot and Mac an Ghaill, 2006, p. 3), contributing to expanded understandings of, and engagement in, performances of gender (Davies, 1993). It is through movement within new spaces that young people encounter diverse gender discourses, which may be experienced as a liminal time of self-evaluation as they consider their own gendered performances in relation to the communities they come from (Stahl and McDonald, 2021). Gender, therefore, becomes a site of reaffirmations as well as rebuttals where the conventions of femininity and masculinity are reinscribed in new ways, contributing to new expectations (see Adkins, 2002; Kenway and Kelly, 2000). To understand how gender is experienced in relation to social change, Risman (2004) posits three dimensions of gender: individual (gendered selves), interactional (gendered expectations during daily interactions), and institutional proposed (organizational practices and regulations).

In all aspects of the life course, identities are often constructed and reconstructed according to experiences within multiple structures, including familial, institutional, and other collectives. Transitions to higher education for all students are never linear and are often fragmented as they come to adapt to what is expected by the institution. Research on widening participation continues to document the motivations of non-traditional students and how motivations change over time, influenced by their experiences. Our research engages in a critical consideration of the contemporary university experience where, as Pötschulat et al. (2020) note, the so-called “student experience” is problematic as it has “implications for how we come to understand a complex set of practices” (p. 2). Their scholarship calls attention to how students engage in negotiations of contemporary studenthood where everyday practices and circumstances are evaluated and positioned according to socially accepted norms and expectations (Stahl and McDonald, 2021).

Drawing from our qualitative interviews with young working-class men and women participating in higher education, our interest is in how our participants’ gendered subjectivities shift over time as well as their shifting perceptions of self. To illustrate our thinking around gendered subjectivities in transition, we present two case studies of first-in-family people studying in elite spaces. Their topics of chosen study are both STEM which carries a connotation of an elite profession and, therefore, both participants could be considered an example of what Southgate et al. (2017) call “extreme social mobility.” This is followed by a discussion drawing on theories of gendered subjectivities, primarily Risman (2004) and Paechter (2003), to explore the journeys of Kate and Vuong as learners navigating communities of practice where they adopt, and rebuff, gendered performances aligned with the norms of the discursive space of the university.

Changes to subjectivities in higher education

Kate

Prior to entering university, working-class girls may experience difficult identity negotiations in order to become academically successful. Recent research on how girls construct learner identities in terms of their gendered subjectivities — such as the “successful girl” who is effortlessly successful both socially and academically — holds salience as an example of normative and idealized femininities (Allen, 2016; Bowers-Brown, 2018; Renold and Allan, 2006). Academically inclined girls from working-class backgrounds may, either consciously or unconsciously, engage in work on the self in order to enact performances aligned with notions of middle-class girlhood. These performances are often the result of extensive labor as girls negotiate a “can do” or successful girl subjectivity (see Harris, 2004; Pomerantz and Raby, 2017). Furthermore, researchers continue to highlight how educationally successful girls from working-class backgrounds—where success carries with it the expectation of social mobility—may come to disidentify with their classed backgrounds through displays of both conformity and resistance (Lucey et al., 2003; Walkerdine, 2003).

We first met Kate soon after she finished her final year of secondary school. Kate, who is Anglo-Australian, is an only child whose mother is a stay-at-home-mum while her father works in packaging. Kate was confident and chatty with aspirations for herself, and she was looking forward to her enrollment in an engineering degree at a prestigious university. In terms of her experiences with

feminine identities, Kate spoke about how most of her friends were male, “the majority of people I get along with are guys,” and this was largely due to a common interest in video gaming. Furthermore, Kate dressed in a masculine style, preferring men’s jeans and shirts because she found them more comfortable than women’s clothing; she often wore accessories associated with her hobby of gaming, such as a Pokemon t-shirt or a Doctor Who baseball cap. Kate was aware that her personal style positioned her outside of feminine norms, “I’d be the really odd one if you looked at a table of girls.” In many ways, it seemed engineering, a male dominated degree, would be a natural fit for Kate, given how she felt comfortable within masculine communities of practice and the male dominated nature of the STEM field (see [DeWitt and Archer, 2015](#)). In research on girls from non-dominant backgrounds, [Calabrese Barton et al. \(2013\)](#) draw attention to how the identities of young women are shaped by how others “recognize and respond” to their self-representation as well as their social and learning practices.

The transition to university can be a time of significant change largely in response to the exposure to new experiences and new people. Young women’s identities are constructed in relation to the possibilities, positioning and performances of femininities largely in relation to the academic experiences informing their aspirations and subjectivities ([Stahl et al., 2020](#); [McDonald, 2021](#)). University, as a performative space which carries the expectation of capital accrual, is a site for the (re)making of identities. When we met with Kate during her first semester of her chemical engineering degree, she spoke to us about her experiences with the Women in STEM community, describing an event occurring on International Women’s Day:

And they were like, what are your [female] role models in STEM, and I was like, I don’t have any. And they were like, “Oh, is that ‘cause women are underrepresented in STEM?” No, because I haven’t looked, and I don’t care.

Kate’s words suggested a frustration regarding discussions of gender inequality in STEM and she struggled to see how it related to her. However, as she engaged more in various overlapping communities of practice where she was exposed to ways of being not only a scientist *but a female scientist* ([Calabrese Barton et al., 2013](#)), Kate’s identity and her opinions began to shift. By the end of the year, Kate was beginning to speak about these issues in a different manner, telling us how one of her lecturers often assumed she and other girls in the class did not understand certain concepts, “he kept assuming we had done it wrong.” The following year, Kate had joined the Women in STEM group which she had initially dismissed and was able to speak at length about how she was less likely to get a job in engineering due to her gender.

Focusing on the intersection of gender and class and contributing to motivations and the maintenance of aspirations, Kate’s experience in an elite setting had also raised her awareness regarding how her class background placed her as an outsider. She recounted an anecdote where class intersected with gender, where Kate highlighted the need to dress in a particular way—dresses, high heels, and makeup—during networking events. Kate, who was used to wearing men’s jeans and shirts, conformed to expectations in terms of feminine clothing, demonstrating how she felt compelled to perform a particular gendered and classed identity within STEM in order to both experience acceptance and to position herself advantageously in the job market. Such an experience led Kate to reflect on where she fit within the university STEM culture. In dressing up, she noted, “I’m like, but why? All it does is show off some social class status that I’m not even a part of.” We are reminded here of how gender and class become sites of struggle where one needs to know the expectations and how, for first-in-family students, this is an additional stressor on top of academic work at university.

Vuong

Prior to entering university, working-class boys contend with various struggles in their education and many of these struggles are identity-based. There exist significant limits within the discursive space of schooling, and wider society, which hinder the ways in which studious working-class boys navigate their journey as learners. Research continues to suggest that boys—and most often working-class boys—struggle to be socially accepted as “cool” by their peer group while also maintaining their academic progress (see [Reay, 2002](#)). We assume when working-class young men move into higher education, the logics around gender alter and what was once pathologized may now be held in esteem. In terms of masculine performances, there may be more possibilities, though this depends on the course of study.

Boys who choose to study mathematics have long been linked to the construction of “a social image of being a ‘nerd’ or a non-popular boy within the peer group” ([Diez-Palomar and Mara, 2020](#), p. 55). In [Mendick’s \(2006\)](#) study of masculinities in mathematics, she calls attention to the “working-class class pretenders” (p. 75) noting the classing and gendering of different disciplines can be an uncomfortable fit for working-class boys. Such experiences of feeling out of place can potentially undermine their confidence and consequently their academic progress. There exist few examples where students can be the all-rounder ([Skelton and Francis, 2011](#)), or where boys can bring a “sporty” and mathematically inclined learner identity together (see [Pomeroy, 2015](#)). When we first encountered Vuong, a Vietnamese-Australian, he presented himself as a confident mathematics student with high aspirations. He complained often about the pressures he put himself under, though he was determined to be successful and proud to be one of the few in his secondary school to attend university. When asked explicitly about being perceived as a geek, he said:

To me I don’t really feel like a nerd or a geek because, although I study and revise a lot, I still go outside with friends, I still have that type of social life that the stereotypical geek and nerd might not have usually.

Vuong, who transitioned to an elite university in the city, enrolled in an advanced mathematics program only available to a select group of students. Therefore, his daily activities were located in an elite space within an elite space. While academically he was successful at university, socially Vuong did struggle to acclimate in what he described as a hyper-competitive environment where many of the boys he knew were involved in elite sport activities such as rowing and lacrosse (these are sports commonly associated with elite private schools in Australia). To give a sense of Vuong's class background, he had never left the Australian state in which he lives. In focusing on place and gender in terms of academics, Vuong described his mathematics course as composed of predominantly men and, more to the point, a very different type of male student than he had encountered before.

Vuong: But, yeah so there is a bit of a difference between just the average guy in my school, high school, towards the average guy in my degree.

Researcher: Yeah, it's just different types of people.

Vuong: Yeah. Actually, there was a case where one of the guys in my degree challenged my masculinity. It was very annoying.

Researcher: How so? How'd that come about?

Vuong: Yeah, he was like, "Do you even play any sports or anything?" And I just had this twinge of annoyance in me that I went, "Excuse me, but you remember that I told you that I play volleyball and everything." And then like, "Oh yeah, you do, don't you?" And then I was going ... He's just very testosterone driven ... Yeah. I put that guy in his place when he challenged my masculinity. Very annoying ... Yeah, because he was trying to make an example.

Vuong's experience works to subordinate his masculine identity and reinforce the gender hierarchy where, in this instance, sports participation functions as a proxy influencing what is deemed acceptable in terms of one's gender identity. Boundaries are being formed and what is considered normative is delineated. As [Paechter \(2003, p. 71\)](#) notes, how we come to understand masculinities and femininities takes place in relation to "a social configuration" where there are "shared practices in pursuit of the common goal of sustaining particular localized masculine and feminine identities." Furthermore, Vuong's words echo research which shows how boys are compelled to balance social acceptability while also maintaining their academic profile, an endeavor which is a continual struggle (see [Reay, 2002](#)).

Discussion

[Risman's \(2004\)](#) posits three dimensions of gender: individual, interactional (gendered expectations), and institutional proposed (organizational practices). We see through the case studies of Kate and Vuong how they experience changes to their gendered identities across these three dimensions and how these changes occur in relation to social class. While Kate is confident in her gender identity on an individual level, recognizing how she transgresses expectations in terms of interactional gendered norms, she is compelled to engage in performances of a feminine identity which is more closely aligned with the institutional expectations of the university. For Kate, these new performances represent a shift in her gendered identity as she comes to understand how the expectations and practices of gendered norms contribute to her long-term goals. Her experience further highlights how individuals are able to, and are oftentimes compelled to, engage in differing and overlapping performances of gender.

For Vuong, his acclimatization is defined by not having, or performing, the right sort of sporty masculinity. While Vuong does in fact participate in sports, he is stereotyped as the "Asian geek" ([Huynh and Woo, 2014](#)) who is un-sporty and, therefore, assumed not to be masculine enough. Through his interaction with the "testosterone-driven" student, Vuong's expectations about what it means to be a male are confirmed. Furthermore, these expectations are confirmed through university marketing materials, what Risman refers to as "organizational practices," where such materials foreground an individual who is sporty, confident, socially engaged and academically inclined, the so-called "all-rounder" ([Skelton and Francis, 2011](#)). We can assume this informs how a gendered sense of self becomes regulated. Furthermore, in contrast to Kate, Vuong is unable to engage in performances of a macho masculine identity expected within the mathematics course. It is unclear how resisting certain gendered performances, how speaking back to false assumptions, may contribute to how Vuong comes to experience university though we suggest it may contribute to him continuing to feel like an outsider.

[Paechter's \(2003\)](#) work on communities of practice highlights how both location and membership within communities bring with them particular ways of performing gendered identities. For both Kate and Vuong, there is a sense of a certain level of comfort within their gendered performances in secondary school. Vuong was confident in his masculine identity where he did not identify

with particular configurations such a geek while Kate was comfortable within her feminine identity where she transgressed gendered norms and expectations, but very much identified, and expected to be identified, as a girl. Yet as these two students transitioned into university, and into new and varying communities of practice, they were both challenged in terms of their gendered identities. As Kate began her engineering degree, she did not locate herself within her degree in terms of a gender binary, and in fact was skeptical of being drawn into the Women in STEM community, a localized community of practice which did not align with her gendered subjectivity. Yet, as she progressed through her degree, it is how she was defined and located within the degree by others, for example as a girl who did not understand the content, that impacted on and mediated her understandings of self as well as her understanding of the performances she must engage in to be successful. Similarly, Vuong's masculinity is positioned by other young men in terms of the logic of a localized community of practice as he recognized the different masculine performances which contrasted with those of his secondary school. In contrast to Kate, Vuong did not appear to engage in new performances of masculinity but rather attempted to position himself within the community of practice by highlighting his involvement in sport and deflecting challenges to his masculine identity. As Kate and Vuong transition from their working-class secondary schools, we see how the space of university is a site of (re)construction of gender, where certain forms of masculinity and femininity are privileged.

Conclusion

While research on gender in higher education has declined in recent decades, our study considers contemporary experiences within education as remaining highly gendered and, when coupled with class, reinforcing of social hierarchies (Stahl and McDonald, 2021). The experiences of Kate and Vuong have implications not only for how they come to be at university but also for how first-in-family students come to understand themselves as socially mobile individuals where belonging is integral. Their stories speak to the student experience as a "complex set of practices" (Pötschulat et al., 2020, p. 2) informed by institutional and societal discourses. Furthermore, the stories of Kate and Vuong highlight how students from non-traditional backgrounds may find the social acclimatization to elite spaces particularly confronting (Reay, 1998), adding an additional barrier to the first-in-family experience. Their experiences compel us to reflect on what is means to embody the ideal university student or, more specifically, what a failure to embody idealized versions of masculinity or femininity could mean. While Kate and Vuong feel comfortable recounting these stories, we are not privy to the gender biases that they were perhaps not conscious of or the various micro-aggressions that could have informed their everyday experiences. While universities in Australia have become inclusive and more students from non-traditional backgrounds attend than ever before, we cannot help but think how the journeys of Kate and Vuong would be different if they could have just been themselves and, more to the point, felt comfortable being themselves.

Introduction

Minority learners include diverse groups. Even when minority learners are defined by race, culture, or ethnicity, there are multiple layers of identity and complexity among any minority learner group. Minority learners often feel a sense of “in betweenness,” which can create a poor sense of entitlement and tension about their rights to occupy education spaces in majority cultures. Minority learners occupy a “third space” reflecting a hybridity which has emerged from the experiences of living between cultures (Aujla-Bhullar, 2016). It has been reported that minority learners do not achieve at the same rate as students from majority cultures (Vang, 2005) and gaps between these groups of learners have persisted, despite considerable efforts to address disparities. Minority learners within school systems often access fewer educational resources, encounter lower educator expectations, and through encouragement to drop out or take lower level courses, have poorer achievement rates (Stuart et al., 2011). These experiences contribute to many minority learners having a negative view of the school system, particularly secondary and higher education. Minority learners are often the first person in their family to pursue higher education and so are more reliant on lecturers’ support to guide their learning, encouragement which is often withheld (Stuart et al., 2011). Jackson and Moore (2008) describe a “doom and gloom” trajectory for black male college students who face a number of barriers within higher education, such as low expectations of academic staff and feeling overwhelmed by course content. Harper (2009) states that in the United States more than two-thirds (67.9%) of black men who start college do not graduate within six years, which is the lowest college completion rate among both sexes and racial/ethnic groups.

Minority learners who also face economic and social barriers experience particular disadvantage in education systems, because these factors impact on academic attainment. Despite admission to higher education having increased for students of color in the United States, minority learners from impoverished areas are less likely to attend higher education than their peers (Reddick et al., 2011). In New Zealand, Pacific children who come from some of the least well off families have the lowest rates of early childhood enrollments, with 86.7% of Pasifika children enrolled in 2012 compared to 98% of European children. A total of 68.1% of Pasifika students left school with the National Certificate of Educational Achievement (NCEA) level 2 or above in 2012, compared with 82.1% of European students. NCEA is the official secondary-school qualification. Level 2 indicates that students have a minimum of 60 credits and have met literacy and numeracy requirements at level 1. Only 11.5% of the Pasifika population have a Bachelor’s degree or above, in contrast to 18.6% of the European population (Marriott and Sim, 2014).

In particular, minority learners from indigenous populations, living in postcolonial Western countries, face the biggest disadvantage. Their lower education participation rates are evident across the United States, Canada, New Zealand, and Australia. Poor educational success and low secondary education completion rates have a negative impact on job and earning prospects, trapping future children of indigenous students in cycles of poverty. Indigenous students, across jurisdictions, struggle in primary and secondary schools which do not reflect their knowledge base or cultural styles. Even at university they report feeling isolated and frustrated, facing interpersonal discrimination and poor interaction with nonindigenous students (Bailey, 2016).

It is apparent from research that across jurisdictions the poorest educational outcomes are experienced by indigenous learners. In New Zealand, Māori early childhood education rates lag behind European rates, with 90.9% enrollments compared to 98% of European children (Marriott and Sim, 2014). Māori have lower secondary school retention, 73.7% of Māori youth at 16 years attend schools compared to 91.8% of non-Māori (Te Puni Kokiri, 2012). For 18- and 19-year-olds enrolled in higher education in 2003, 52% had completed their qualification by 2010 compared with 67% of all 18- and 19-year-olds (Te Puni Kokiri, 2012). Within the Canadian education context, in 2006, only 9% of First Nations women had obtained a university degree, compared with 23% of women in the general population (Bingham et al., 2014). First Nation students need to adapt and shift to the culture of educational institutions, a process which they compare to historic colonial experiences. They experience negative stereotypes and prejudice from other students and inaccurate portrayals of their people in the curriculum (Gallop and Baestein, 2016). In Hawaii, 28% of public school students identify as Native Hawaiian or part Hawaiian. These students encounter a range of struggles,

achieving at a lower level in standardized tests, which generate low rates of enrollment in higher education (Yamamoto and Black, 2015). For Alaskan students, Campbell (2007) estimates 29% drop out of high school, compared to 16% of their white counterparts. Alaskan students make up only 1% of students enrolled in postsecondary institutions and only 8% of those have higher degrees (Campbell, 2007). There are similar educational disparities between Aboriginal students and the rest of the population. Despite an increase on Aboriginal student participation in high school, from 35% in 1996 to 44% in 2006, this has not occurred in higher education settings, with a large decline in indigenous student participation after compulsory schooling (O'Shea et al., 2013).

Negative and “color-blind” discourses on minority learners

A negative and “color-blind” discourse exists within the literature on minority learners, which views these poor education outcomes as the result of economic deprivation, housing problems, poor family backgrounds and cultural deficits. Failure of minority learners is explained by inadequate family systems and community structures, which are seen to cause behavioral problems among students. Cultural deficits are also viewed as a significant factor in explaining the socio-economic status and educational failure of minority learners. George (2000), for example, claims black students belong to a culture infected with an anti-intellectual strain which teaches them not to embrace school work. These ideas are often transmitted through educator education programs, where trainee educators learn to encourage minority students to reduce family and community affiliations, and adopt dominant white middle-class cultural practices in order to succeed (Bishop et al., 2003). A similar negative discourse attributes the poor educational outcomes of international students to cultural distance, with a focus on cultural assimilation as a means to improve student integration and success (Vu, 2013).

Assumed lack of family involvement is a significant part of negative discourses concerning minority learner underachievement. In a study of educators' discursive positioning in relation to factors which influence New Zealand Māori achievement, most viewed Māori students themselves or their home contexts as contributing to poor educational outcomes pathologizing their lived experiences (Bishop et al., 2003). Perrot (2015) declares that there is also a perception that Pasifika parents' lack of understanding about their children's education and disconnect between home and school life limits their ability to help their children. Participants in Fletcher et al. (2009) study contextualized poor oral language environments at home with the socio-economic demands in Pasifika families, meaning there is less time for parents to develop rich oral environments to support learning. Zalaquett and Lopez (2007) report that a lack of strong adult supervision is seen as a contributing factor to the struggle of Latinx students within the education system. While Latinx parents are thought to understand the value of education, they do not have experience to assist their children, due to language barriers, low income attainment and insufficient knowledge of the higher education application process (Zalaquett and Lopez, 2007).

This negative discourse is pervasive and is reinforced when educators bring similar negative preconceptions about students' abilities to their teaching practice. In the classroom, they can develop low expectations of minority learners, viewing them as poor listeners, who talk out of turn or speak too softly. Lower educator expectations are noted for Māori students at all levels impacting on their achievement, particularly those moving from Māori medium to English medium schools (Oag.govt.nz, 2012). Nakhid (2003) argues similarly that the true identities of Pacific students are undervalued and that they are not satisfied with the perceptions that their educators have of them. O'Shea et al. (2013) also describes a pervasive “mindset” within the Australian school system, which seems to accept Aboriginal underachievement as normal, based on poor student attendance, a lack of systematic analysis of indigenous student performance and underdevelopment of strong indigenous educational leadership (O'Shea et al., 2013).

This negative discourse is “colorblind” to the impact of culture and racism on the education of minority learners. Yamamoto and Black (2015) argue that Native Hawaiian students struggle to succeed in Western-based education and economic systems. For them to succeed there is the expectation that they take on manners and values related to success in a Western system. These students then struggle with identity negotiation in the school system, instructional methods and measures of accountability, which contest their own values (Yamamoto and Black, 2015).

This explains why disparities have persisted despite education reforms and attempts to develop bicultural and multicultural approaches to mainstream education. Reforms are ineffective because they are developed within a neo-colonial paradigm, based on Western knowledge that has racism embedded in the privileging of the dominant cultural practices and processes. It also imposes sense-making and knowledge-generating approaches from outside minority cultural groups, which in New Zealand, for example, fails to acknowledge Mataranga Māori (Māori ways of knowing) (Berryman and Eley, 2017). Hemara (2004) considers that gaps between Māori and non-Māori students need to be considered within the context of community values and argues that the important disparity is Māori aspirations and their actual achievements, arguing that traditional values can be transitioned into contemporary contexts. Mahuika et al. (2011) also argue for acknowledgment of the uniqueness of Māori learners, and for assessments which reflect better the cultural needs of these students.

Whether Pacific learners are minority learners remains a question to be debated. We are resistant to labeling them, for fear of deficit theorizing.

Minority learner experiences in higher education

Pacific people in Aotearoa New Zealand

Who are Pacific people in Aotearoa New Zealand? This is a question that is constantly discussed in educational spaces. What term is most relevant? What term is most suitable? Actually, there is no one appropriate response. The umbrella term “Pacific” has been used by the New Zealand government, agencies, educational institutions, and academics to describe the ethnic make-up of people migrating from the Pacific Islands to Aotearoa New Zealand (NZ) (Cook et al., 1999). Bedford and Didham (2001) state that the term “Pacific” has been commonly and widely utilized at all levels of society including educators, policy makers, community workers, the media and institutions. The use of the term has often led to broad generalizations about a group of people who have diverse cultural identities.

A foundational document for research titled the “Pasifika Education Research Guidelines” (Anae et al., 2001), developed for the Ministry of Education in Aotearoa New Zealand, provided one definition of Pacific peoples. At the time of development, it made reference to the six Pacific nations of Samoa, Tonga, Niue, Cook Islands, Tokelau, and Fiji. In this context, “Pacific people” is exclusive of Indigenous Māori and in the broadest sense covers peoples from the Island Nations in the South Pacific, and in its narrowest sense, Pacific peoples in Aotearoa New Zealand. The research guidelines go on to clarify the issue of Pacific people as being a heterogeneous group with different inter- and intra-ethnic variations in the cultures. Variations include New Zealand-born/raised, island-born/raised Pacific people and being recognized as diverse groups. For the purposes of this article “Pacific” has been utilized, rather than “Pacific Island.” “Pacific” refers to people who can “trace descent to and/or are citizens of any of the territories commonly understood to be part of the Pacific (i.e., Melanesia, Micronesia, Polynesia)” (Fairbairn-Dunlop et al., 2008, p. 11).

The way Pacific learners are positioned and theorized about is interesting for educators. Pacific learners are often theorized as minority learners or diverse learners. But what does this really mean. The process of colonization has been one of the most fundamental disruptions of Pacific Islands’ systems. Colonization has impacted on Pacific peoples’ values, beliefs, language, philosophies, religions, and social, cultural and economic systems. There are challenges, narratives and areas of attention which have encouraged Pacific people to reclaim indigenous identities. Decolonization in the Pacific Islands region has been focused on communities in the Pacific region for strengthening and developing the well-being of young Pacific people in higher education (Chu, 2009).

Decolonization for Pacific people has been a gradual process of discussions and attitudinal changes through talanoa/discussions and informal educational transformations. The diverse Pacific region has contributed to a more fluid initiation into decolonization for varying groups. The year 2000 marked a significant decolonization shift in education for the Pacific region. Pacific people initiated the process of identifying challenges, needs, and areas of attention for their countries. The Rethinking Pacific Education Initiative (RPEI) was created as a cause movement by a group of Pacific educators and leaders who wanted to see deeper systemic changes occur for Pacific learners and their communities (Chu, 2009). The decolonization movement has allowed Pacific people to reclaim indigenous Oceanic perspectives, knowledge and wisdom that have been devalued and oppressed. Activist and thought leader, Thaman (2003) has provided much of the impetus to enable Pacific people to reflect critically on the nature, scope, and processes of colonialism in Oceania. The challenges have been thrust at the dominance of Western philosophy and pedagogy. Thaman’s early criticism of colonization has fueled the process of decolonizing the field of Pacific studies. The impact of colonialism on people’s minds has impacted in their ways of knowing, their views of who and what they are, and what they consider worthwhile to educate and to learn. The premise is that Pacific learners should be supported in higher education to live and learn with their Pacific cultural identities intact. Pacific students do not have to leave their cultural identities at the door to become somebody else or to have to assimilate into the dominant cultural identities of higher education.

Social relationships in higher education

In the South Pacific region, higher education is also called post-secondary education, and is any level of education pursued beyond high school, including undergraduate and graduate credentials. These credentials encompass certificates, diplomas or academic degrees in Aotearoa New Zealand. An arm of the New Zealand government that overlooks higher education is the Tertiary Education Commission (TEC). The TEC has continually stipulated through the past two decades that one of its priorities is to increase the outcomes of Pacific students achieving at higher levels. Further, TEC believes that the NZ higher education sector has a key role to play in meeting the development needs and aspirations of Pacific peoples. New Zealand research suggests institutions have to create environments that engage students with institutional culture by offering support in a variety of ways. The premise is that the New Zealand education system does not adequately meet the needs of Pacific learners. There is evidence of varying support programs that have been developed to enhance the pastoral care of students, but without any thought to the unique circumstances of Pacific learners’ academic needs. Others have been superficially adapted with respect to program materials, but without a deeper consideration of the myriad programmatic, organizational and external factors that exist. Higher staff are eager for guidance to more meaningfully adapt or develop teaching and learning methods that meet the needs of these students. Rather than focusing on these negative statistics, educators in higher education must shift the whole paradigm to a strengths-based approach. This is an urgent shift. A strengths-based approach focuses on developing assets that are known protective factors, such as strong relationships, life skills and school connectedness.

As a response to colonization, one question can be asked, what is success for Pacific people in higher education? Pacific scholars have tried to address this issue of success for Pacific people in all forms of education (Perrot, 2015). While there are signs that Pacific achievement is trending up and has made incremental improvements (Southwick et al., 2017), comparable to other groups, Pacific learners are still behind, statistically (Southwick et al., 2017). Research has shown that achievement for Pacific people in education should be focused on the authentic development of self (Perrot, 2015; Chu et al., 2013), where education and learning environments develop students as strong positive people who have confidence in their ability and connected with quality education that builds quality nurturing relationships with staff, educators and the school. And also when environments are inclusive, which reflect and legitimize Pacific culture, connections and values, the result can be successful academic achievement. In the context of decolonization, achievement and educational outcomes will have a different meaning for communities. This meaning is based on the values of the community. For example, education for diverse Pacific communities is about building and fostering relationships, rather than solely focusing on the measurement of grades as success. Racism is revealed to be an issue at the tertiary level by Mayeda et al. (2014). In addition to experiencing university as a “white” place as a result of a Eurocentric curriculum, the research describes the way on-campus racism reinforces a sense of alienation for Māori and Pacific students. This can take the form of assumptions by other students of Māori and Pacific privilege regarding entry to tertiary education. This implies a lack of effort and ability. A sense that majority-group students require others to forsake their identity in order to fit in can be felt by Pacific students. The adoption of a low profile can be the result of repeated discrimination. The researchers suggest that, although some students succeed in converting discrimination to motivation, this responsibility should not rest with students. Consequently, a recommendation is that management teams should not only address perpetrators of discrimination, but also work with Māori and Pacific students to warn them of the issues and encourage them in ways of channeling the negative emotions they are likely to encounter as a result of everyday racism and colonialism in education.

If educators apply the law of “indirect effort” by steering their focus on the development of the person through authentic cultural learning environments and the building of quality relationships with students, achievement that is based on peoples’ aspirations and ideals will follow. Success can be explored through a holistic lens of student identity and learning needs, this point resonates with the “Third Space” (Bhabha, 2004), which posits the theory of hybridity to include identity, community and education. The Third Space allows for recognition of the uniqueness of each person and/or context in their lived experiences. It is a place where hybrid identifications are possible and where dialogs about contestation, conflict and politics between cultures progress. Borders can separate cultures and societies. In today’s globalized world, cultures are blending increasingly. As traditional colonial knowledge is mixed with peoples’ own indigenous knowledge the opportunity exists for creative heterogeneity. The result of this encounter is the emergence of a hybrid culture that can no longer be traced back to the roots of either community. Bhabha asserts that nations and cultures must be understood as narrative constructions rising out of the hybrid relations of competing constituencies. There is a continual process of interpretation and reinterpretation. In education this is evidenced by an individual’s characteristics evolving. Bhabha studied the space constituted around the encounters between the colonizers and the colonized. Within the Third Space hybrid cultures are created as a fusion of the colonizer and the colonized. As one focal point, the middle ground between Pacific communities and the State has provoked an ongoing debate about whose values are represented in the NZ educational system, and the absence of Pacific peoples’ values from the classroom environment (Chu et al., 2013).

To take this notion of the Third Space for Pacific learners in Aotearoa New Zealand, it is evident that the Third Space is a complex ground. When educators put the person at the center of learning, that person becomes self-determined for achievement and not the other way around. Educators who put achievement over personal development are in for an arduous task if they desire success for their Pacific students. Person-centered approaches (such as educational mentoring) embody a strong sense of self can help to develop a strong identity for young Pacific people. When Pacific students are strong, they embrace their own story; when they embody self-awareness, then their personal learning and achievement are almost predictable. The terms of learning and achievement are defined by the students. In the spaces of the classroom, skilled educators draw out the cultural identities of students with the provision of appropriate content, assessment and curriculum. This process must be one that is reclaimed and defined by the students and not the institution. What is also rewarding is seeing the shift that happens within students when they finally feel successful (Perrot, 2015). Personal development for students has positive effects. In higher education, mentoring has been described as a one-to-one learning relationship with the mentor being older than the student, perhaps a faculty member, staff member or student. The process of the relationship, which can be informal or formal, is based on modeling behavior and extended dialog (Johnson, 1989). However, Jacobi (1991) found that 67% of undergraduate students at a large West Coast university in the United States reported that it was challenging to find a mentor or role model. It is further suggested by Jacobi (1991) that the prevalence of natural or informal mentoring relationships in educational contexts, including undergraduate and graduate education, is unknown. Since the 1980s there has been an increase in mentoring of undergraduate students as a retention strategy rather than the focus on the apprentice model of graduate education in the United States (Jacobi, 1991). For instance, using undergraduate students as peer mentors discounts the importance of age differences between mentors and protégés (Rice and Brown, 1990). Knox and McGovern (1988) found that 51% of mentoring relationships were developed during graduate school and another study showed that graduate school protégés who had strong collaborative relationships with their mentors tended to subsequently achieve an academic position (Long and McGinnis, 1985). For minority ethnic groups, Johnson (1989) discovered that mentoring for undergraduate women and students of color was relatively rare, whereas Blackwell (1989) found that one in eight African-American students had a true mentor. However, at the graduate level, mentoring appeared to be more common (Jacobi, 1991). Due to a variety of factors of mentoring in higher education, the understandings and definitions vary (Merriam, 1983). The variance in factors is attributed to different student populations (students of different ethnic backgrounds, men vs. women); different academic levels

(undergraduates vs. graduate students); different institutional characteristics (small arts colleges vs. large public institutions); and different fields of study. In Aotearoa New Zealand there has been a growing collection of educational research on Pacific learners with a greater emphasis on understanding the theoretical concepts of what works for Pacific learners as they go about their educational journeys. Much of the established research discusses in general what people or organizations provide to enable Pacific learners. The concept of the learning village looks at the importance of the contextual and institutional factors identified from the literature that enhanced positive outcomes for Pacific students. Overall these factors enable students to feel safe as Pacific individuals in education. [Benseman et al. \(2006\)](#) identified contextual factors that would help increase Pacific student retention. Central to the educational success of students is the connection and communication between the student, the community, and the institution. These include:

- Presence of Pacific academics and staff allied with services and programs designed to specifically support Pacific students.
- Pacific presence in institutions such as provision of dedicated space, holding Pacific events, and creation of Pacific associations and a supportive environment for Pacific students.
- Provision of role models such as educators, parents, older siblings, or cousins.
- Pedagogical practices which are student-centered, engaging both learners and lecturer, committed to high expectation and achievement for all students, availability of academic support, access to resources, accessible pastoral care and a “staircase” environment that provides links for one level of qualification to the next.
- Accurate, appropriate, and timely information made accessible and available to all students.
- Presence of Pacific staff in leadership roles in higher institutions, as indicated by [Peterson et al. \(2006\)](#).

This provision of caring practice is aligned with [Tinto’s \(1993\)](#) “Model of Institutional Departure” states that students need integration into formal (academic performance) and informal (faculty/staff interactions) academic systems and formal (extracurricular activities) and informal (peer-group interactions) social systems. Through deliberate practice, staff are committed to the students they serve, and that they put student welfare ahead of other institutional goals. This means that institutional goals should always have a direct or indirect relationship to student success and achievement and be committed to the education of all, not just some, of their students. Furthermore, Tinto emphasizes that students must feel that they are valued and full members of the community. That also means that the expectations of achievement and behavior are the same for all students. The interaction student attrition model of [Tinto \(1975, 1998\)](#) explains that students have a variety of educational experiences, skills and competencies, family and community backgrounds and values. These social and individual factors influence how a student integrates into their studies at universities. Several programs in Aotearoa New Zealand have implemented inclusive environments to support Pacific students in their journey through higher education. As some higher education success examples which embedded social and individual values of learners, Te Rōpū Āwhina was a program at Victoria University of Wellington that produced Māori and Pacific professionals who could contribute towards community development and leadership. The principle behind the initiative was the creation of an inclusive off and on campus whanau/family environment imbued with positive values of high expectations, achievement, collective success and reciprocity. Based on the quantitative analysis of student achievement and student surveys, the results show consistency with the improvement in achievement and retention of Māori and Pacific students ([Wilson, 2011](#)). It can be inferred that such a mentoring program for ethnic minority students at a university leads to a change in the mainstream culture. Mentoring programs provide significant changes for education, and this leads to a process where Pacific peoples are able to recreate a new narrative, rejecting the negative narrative of society. Where the goal is to bring about change by shifting the culture of the organization, additional degrees of complexity and resistance are expected.

Cultures within higher education need to be examined in ways that embrace ethnic minority groups of students. [Tierney’s \(1988\)](#) work provides a framework for higher education culture which includes six major components: environment, mission, socialization, information, strategy, and leadership. The socialization element represents one aspect in which mentoring can contribute additional information. This can be illustrated with [Tierney’s \(1988\)](#) framework, where he asserts that socialization takes into account answering such questions as “How do members become socialized? How is it articulated? What do we need to know to survive/excel in this organization?” The educational organization reflects the norms, values and practices of the wider society and can present significant challenges for diverse communities whose values are not represented. Cultural alignment is relevant to educational access for Pacific students in NZ because, where educational organizations listen to and understand what matters to families and communities, students are more likely to be supported within inclusive relationships. However, where relationships between schools and communities are poorly configured, Pacific student success depends on the skills of unsupported students to negotiate between conflicting cultural demands or choices. An unbridged distance between home and school can operate to make access to all aspects of education problematic for Pacific students since it ignores the collective basis of Pacific cultures.

[Millward et al. \(2012\)](#) examined the retention and success rates of students at three different campuses which were similar despite the differences in ethnicity, socio-economic background and previous academic success. The underrepresented groups in two out of the three campuses, mainly Māori and Pacific, entered the university via the special admissions pathway and passed their courses at similar rates as the regular entry students. This links into the study of [Bunce et al. \(2021\)](#) and the experiences of British university students from black and minority ethnic (BME) backgrounds who were less likely to achieve a “good” degree classification than white students. The researchers used the self-determination theory which proposes that achieving one’s full potential for learning, alongside experience of well-being, is supported by environments that help individuals to meet their needs for relatedness, competence and autonomy. They found barriers which impaired BME students’ experiences situated in the university structures.

Accordingly, Davidson-Toumu'a and Dunbar (2009) argued that education and culture should go together and that educators should be aware of how the two concepts work. They added that Pacific students should be viewed as a whole person whose world is filled with cultural roles and familial obligations other than just being a student. Pacific success in higher education is evidenced when Pacific students build quality relationships with academic and nonacademic staff and other students within their programs. Quality relationships are defined as those that are reciprocal in nature and are intentional in their intent towards growth and development for Pacific individuals both as people and students.

Maxwell (2007, p. 116) states that "... people don't care how much you know until they know how much you care." Evidence in Aotearoa New Zealand suggests that when educators primarily focused on the care of Pacific students, facilitated through the development of authentic reciprocal relationships, the by-product was increased Pacific academic achievement in higher studies, as defined by the learners themselves (Southwick et al., 2017; Chu et al., 2013). Students' reflections revealed that their success had more to do with the quality relationships they developed with their tutors and/or lecturers than the quality or quantity of content students received (Southwick et al., 2017; Chu et al., 2013). The realization of equitable academic achievement for Pacific as Pacific requires academic staff to shift their philosophy of teaching to be primarily about relationship building than content delivery. Conceptually, the "relationship" developed has to be seen as the vehicle through which knowledge, learning, and content are funneled. But without a strong relationship this can be a barrier. In stark contrast, a study by Tran (2013) explored ethnic minorities' experiences in education in Vietnam. They found that when teachers had low expectations or neglected students, this had negative impacts. The abandoned students felt alienated from the school, hardly participated in the class activities, had poor educational performance, felt discriminated against, and eventually dropped out. The problems between students and teachers existed due to the physical and social distance among teachers and students, differences in cultural sensitivity, lack of extracurricular activities, and lack of encouragement and praise from teachers.

Chu et al. (2013) identified that Pacific students across multiple institutions felt that achievement as students came about through relationships described as respectful and nurturing. The word nurturing in the Oxford University Press Dictionary (2020, para 1) is explained as to "Care for and protect (someone or something) while they are growing." This care and protection are evidenced by educators that go outside of their job description for Pacific students. They demonstrated an eagerness to put in extra one-on-one time for them, and demanded high expectations and standards for them as students. Educators held the unyielding belief that they could be successful as students, coaching and mentoring them to pursue higher level qualifications and set goals. Further, educators who put in work to ensure their teaching strategies and design were student centered met the needs and multiple literacies of students. Students described staff as flexible and passionate, and that they made an effort to connect with students' communities and families. Educators also helped students "edge walk" the multiple worlds they existed in and understood or also took the time to understand Pacific students' worlds. In this process they made students feel proud and strong about their multiple identities and cultures. The educators also enabled students to critically reflect on how their success as students was a form of social justice to an education system that seemed structured in such a way as to prevent their success (Southwick et al., 2017; Chu et al., 2013; Marshall et al., 2008). This level of care from educators ultimately protected students, and for many it enabled them for the first time to feel safe, cared for, liberated, secure, and strong as Pacific people in education. This notion of edge-walking can draw some similarities to the Native American situation where higher education organizations have reported retention challenges for Native American students. Agbo (2001) suggests that high dropout rates and low levels of academic achievement of Indigenous students are not due to the inability to adjust, cultural impoverishment, or cultural differences, but rest in cultural discontinuity. The main argument of cultural discontinuity is the assertion that Indigenous peoples experience reality in a completely different way to the dominant culture. As a result, the extent of the incongruence of realities Indigenous peoples often experience within the dominant culture can be devastating to the Indigenous sense of self and experience of being in the world. As a response to the lived realities, Shield (2004) provided a framework called the Medicine Wheel where the aspects of community, cultural values, Indigenous identity, and spirituality are encompassed. These components are necessary for the development and well-being of Indigenous learners in their educational experience. The model is Indigenous in substance and content, and it is generated and grounded in Indigenous thought and view. The model relies on the foundation of spirituality and solidification of Indigenous identity throughout all aspects of its design.

Conclusion

Social relationships for minority ethnic learners in higher education can enable learners to enjoy academic and personal success while studying. Minority learners often experience challenges in higher education that is beyond their immediate control. Institutions and educators have a responsibility to provide teaching and learning that is conducive to the cultural needs of learners. The process of positive learning can be evidenced as educational reform as a way to strengthen the lives and cultures of learners and their communities. The importance of relationships for Pacific students in education is crucial. If Pacific students are to succeed as Pacific in higher education, academic and nonacademic/professional staff have to foster quality relationships with students. Student have to feel cared for and protected by the people that are in education and supporting them. Staff as well as institutions also have to foster learning environments that are collaborative and enable aiga (family) feelings of well-being among students. Relationship building cannot be an optional extra for educators. It has to be part of their core function. The narrative about Pacific learners and other minority ethnic groups must be centered on strengths-based approaches as the populations of learners become more

diverse in Western institutions. Instead of inflicting negative discourses about diverse learners, the policies, teaching, and resources should reflect the identities and needs of ethnic learners so that they have a sense of belonging.

Background: higher education and the labor market

For many decades higher educational institutions in both the UK and globally have been changing in the light of policies influenced by marketization and neoliberalism (Molesworth et al., 2011). With the erosion of the Keynesian welfare state in the 1970s, the rise of neoliberalism has gradually transformed higher education (HE) into a market in which universities are expected to compete for funding while students play their part in shaping the system through their respective choices (Troschitz, 2017: 139). As a result the political discourse around higher education institutions has shifted away from HE as a publicly sourced and protected resource, a “public good”, with a critical role in defining and engaging with issues pertaining to society and culture, toward more of a business performance model in which issues like quality, competition and student satisfaction have become paramount (Molesworth et al., 2011). Such institutions cannot assume independence from the market but rather must justify their existence by satisfying relevant performance indicators to legitimate their status (Walters, 2012: 62).

The marketization of higher education has been accompanied in the UK by a government-backed drive toward a knowledge-based economy that has sought to broaden the scope and appeal of a university education. One of the outcomes of this transition has been that higher education is no longer simply the preserve of a privileged elite but has become a mass-based system (Trow, 1989). Since the 1990s the numbers of students, universities and colleges have multiplied. Furthermore, the student body has expanded in terms of class, gender, ethnicity, disability and age (Merrill, 2015), thereby capturing a more diverse swathe of the population including under-represented groups.

During this period the perception of the role of higher education has evolved into an environment concerned with delivering lifelong learning and employability skills for the labor market (Molesworth et al., 2011; Barnett, 2017). Higher educational institutions have met this challenge by advancing a series of measures designed to enhance student employability. These include more vocational modules, department and institutional initiatives. Work-based learning together with links with external organizations and entrepreneurial activities are also being encouraged.

The employability narrative has also been advanced in the wake of universities being monitored to gauge how well they perform in making their students employable. Graduation rates are published annually (O’Leary, 2020) as well as league tables and world-wide surveys into graduate recruitment to highlight the institutions that are most successful in promoting student employability. This identification of the role of universities to deliver employability reflects the concerns of students in the wake of rising education fees and increasing competition in the labor market. In the pursuit of employment a degree is no longer enough (Tomlinson, 2008) and the ability to highlight extra-curricular experiences and skills development alongside credentials are needed to stand out from the crowd (Tholen, 2013).

Definitions of employability

Employability has been conceptualized in a multitude of different ways (Forrier and Sels, 2003). As Tymon identifies, “employability is complex and multidimensional” (2013: 842). Appreciating the differing motivations of the respective actors involved

has a part to play in understanding the variegated complexity of this term, whether from students, higher educational institutions or employers (Hugh-Jones et al., 2006). Nevertheless, the discourse around employability can be understood to refer to preparing students for the labor market with skills that appropriately reflect and are relevant to their qualifications and intellect.

The ability to find employment, stay in employment and obtain new employment as and when required has typically been thought to depend on a student's human capital (Hillage and Pollard, 1998; Thijssen et al., 2008). An employable person is portrayed as successful at achieving his or her goals within employment. Employability here is understood in the context of universities developing and fine-tuning student skills to meet the needs of the labor market. This "human capital" view of the relationship between education and economic growth continues to be the heart of government policy in the UK (Troschitz, 2017).

This definition of employability is often informed by employer accounts of skill requirements. These tend to lack specificity, as generic identifications of skill requirements are difficult to establish. Further points to observe include that employers are not restricted in their assessment to simply job requirements but may also be influenced by the supply of graduates at any time. What universities actually teach is also not necessarily at the forefront of employer concerns. Several empirical studies draw attention to the point that selection and hiring practices are not simply merit-based (Jackson, 2007) nor do they reward "typical" graduate skills (Wilton, 2011). In this regard, Archer and Davidson (2008) revealed when looking at employer's perspectives that soft skills like communication, teamwork and integrity are increasingly valued as much as knowledge/subject skills.

However, the concept of employability together with its reliance on human capital theory has been subject to wide-ranging critique. The theoretical dimensions have been challenged (Tomlinson, 2010), as has the lack of attention to subjective experience (Holmes, 2001). In broader ideological terms, the concept of employability emerges in the context of a shift from an engagement with the question of employment from a structural perspective to one concerned with an agency-led address of what the prerequisites are to be employed in the current labor market. Its individualistic perspective as Brown et al. (2002) highlight fails to acknowledge that "employability is primarily determined by the labor market rather than the capabilities of individuals" (2002: 9) and thus conforms to a neoliberal view of market individualism.

In acknowledgment of the structural component of labor demand, Brown and Hesketh introduce the notion of the "duality of employability". This duality entails both an "absolute dimension" in which individual skills, knowledge and commitment and a "relative dimension" in which this is gauged in relation to "how one stands relative to others within a hierarchy of job seekers" (Brown and Hesketh, 2004: 25). In other words, the relative dimension addresses the question of supply and demand, an important consideration in relation to an environment like the UK in which the growth in supply of graduates does not match the demand in terms of graduate level jobs. Employability from their perspective should therefore be defined "as the relative chances of finding and maintaining different kinds of employment" (Brown et al., 2002: 11).

As Brown and Hesketh identify, the relative position of graduates is always susceptible to change irrespective of their ability to satisfy skill requirements. In a market in which demand outstrips supply and the reification of skills is regarded as the measure the struggle for positional advantage only intensifies further and other factors that serve to make the difference become even more significant. An example of this is where British students take opportunities to "fast-track" graduate jobs through internships to differentiate themselves from other students. Such trajectories only serve to reinforce structural inequalities since these paths are more available to students from privileged backgrounds at elite institutions.

The framing of the employability agenda in terms of university institutions, employers and students tends to overlook how gender, ethnicity, social class and disability play a part in disclosing labor market opportunities (Morley, 2001; Finnegan et al., 2020). These factors allied to inequalities relating to social and cultural capital are often lacking from policy debates on employability and educational reform. From the perspective of educational institutions, efforts to align the learning experience with the perceived demands of employers are driven by the need to evidence high rates of employment outcomes for students. These concerns however underestimate the structural inequalities reinforced in the context of promoting these ends as well as more directly within the labor market itself. As many studies show (Thijssen et al., 2008; Finnegan et al., 2020) the emphasis on skills and employment outcomes typically ignores institutional policy, social context or the macroeconomic conditions.

Student experience

In *The Student Experience*, Haselgrove (1994) highlighted the need for institutional thinking and engagement to respond to the challenges of a more diverse student body and an acknowledgment that class remains a fundamentally important reference point for understanding what it means to experience being a student. In the UK there is a growing amount of research that examines student experiences across the university sector (Archer and Hutchings, 2000; Harvey et al., 2006) and within that material that looks at working-class experiences (Tett, 2000; Reay, 2003; Reay et al., 2010; Bradley and Ingram, 2012). Bradley and Ingram (2012) found that working-class students experience more challenges and constraints than their middle-class colleagues. Finnegan et al. (2020) similarly identified that working-class students reported that experiences in HE did not cater sufficiently to non-traditional students and the outcomes in terms of employability were not equivalent, encountering high-flier employers that targeted specific universities and specific groups within those universities that tended to favor traditional students. The UK education system (including HE) reflects the broader society in being highly stratified and those from private schools, Oxford and Cambridge continue to get the top jobs, often through the "old boy's network". As the *Social Mobility and Child Poverty Commission* (2015) found recruitment to top jobs is now favoring "poshness". Non-traditional adult graduates, therefore, experience barriers in the graduate labor market.

The research

This article focuses on the learning experiences of women adult students studying for an undergraduate degree in higher education in the UK and their expectations for the future in relation to the graduate labor market. Issues of gender and class are central to this discussion as the women in our research were working-class women. We draw on the voices of women adult students from two European Union (EU) funded research projects. The first project—Access and Retention: Experiences of Non-traditional Learners in Higher Education (RANLHE)—(see Finnegan et al., 2014) involved eight partners from England (2), Germany, Ireland, Poland, Scotland, Spain and Sweden. The overall aim of this project was to look at the experiences of adult students in relation to access and retention and why some were able to “keep on going on” and succeed while others from the same socio-economic background chose to leave university without completing. The second project—Enhancing the Employability of Non-traditional Students in HE (EMPLOY)—aimed to promote the enhancement of the employability of students in higher education from a non-traditional background through improving the efficiency of transitions into the graduate labor market. The research highlighted the inequalities (class, gender, race, age) which adult students faced in transitioning from higher education to the labor market. Importantly the project took a critical stance on the concept of employability as the traditional perspective of employability is framed within a neo-liberal, marketized and individualized view of higher education and the labor market. University—employer links are now viewed as good thing for the employability of graduate students and for the needs of the labor market. In doing so the social purposes of the university is lost. This project was also funded by the EU and involved six partners from England, Ireland, Poland, Portugal, Spain, and Sweden.

Both research projects used the term non-traditional student. The research team defined non-traditional student in the following way:

Students who are under-represented in higher education and whose participation in HE is constrained by structural factors. This includes, for example, students whose family members have not been to university before, students from low income families, students from minority-ethnic groups, students living in what have been traditionally low participation areas as well as mature age students and students with disabilities.

At the core of our research was the employment of biographical methods. This will be elaborated on later but using such a method enabled the women students to tell their stories and talk about their experiences in-depth. And central to the stories told by women were issues of gender and class inequalities.

Gender and class

The widening access to higher education in the UK since the 1980s has encouraged adult women (and men) to return to education and the majority of adult students in HE have been and continue to be women. Studying for a university degree can be a powerful biographical experience for non-traditional students as it opens up a new way of looking at the world (Alheit and Dausien, 2002; West, 1996). At the same time it can also be a risky business (Reay, 2003; Barnett, 2017). The biographies, as highlighted later in this article, reveal the determination, but also the struggles of working-class women adult learners to transform their lives in some way (Skeggs, 1997; Merrill 1999, 2015; Tett, 2000), not only for themselves but also for their children. Structural constraints were lessened through the use of agency enabling the majority of women to complete their degrees in the social science disciplines.

Feminism was pivotal in making public the structural inequalities and oppression which women experience in society. Feminism stimulated the development of feminist theory and research in sociology in the 1970s and later in adult education and in doing so critiqued and challenged traditional “malestream” sociology (Delamont, 2003). It questioned who has the power to construct knowledge. Feminist research brought women out of obscurity emphasizing that the “personal is political”. As Reinharz explains:

Making the invisible visible, bringing the margin to the centre, rendering the trivial important, putting the spotlight on women as competent actors, understanding women as subjects in their own right rather than objects for men.

Reinharz (1992: 248).

From the 1970s onwards in the UK feminist adult educators focused on women’s education for social purpose, social justice and transformation through a curriculum of women’s studies which examined the nature of women’s oppression through “really useful knowledge” (Johnson, 1988). Feminist popular adult education is seen as a site of struggle (Barr, 1999; Thompson, 2000), working with women in oppressed communities while research largely focused on working-class women’s experiences in HE. Recently research has explored the intersection between gendered and classed experiences in both further and higher education (Skeggs, 1997; Tett, 2000; Reay, 2003; Merrill, 2015).

Gender cannot be looked at in isolation as it is not the only form of inequality experienced by the women we interviewed. The women did not see themselves as being just women as they described and defined themselves as working-class women. Being

a woman and being working-class cannot be separated. Class as well as gender, and for some race, were subjectively and emotionally perceived as defining their identity and who they are. This resonates with the women students studying in further education who Beverly Skeggs interviewed. As Skeggs asserts “... the category ‘woman’ is always produced through processes which include class and classifying produces very real effects which are lived on a daily basis” (1997: 2). She continues “The women never see themselves as just women: it is always read through class” (1997: 91). People, therefore, experience multiple forms of inequality in society. The concept of intersectionality introduced by Crenshaw (1989) which first linked gender and race to understand black women’s lives was later extended to include other forms of inequality such as class. Anthias summarizes this in the following way by stating that: “classes are always gendered and racialized and gender is always classed and racialized and so on” (2005: 33). As the women’s stories reveal gender and class are inextricably linked in terms of their identity and daily lives.

Class

Class and class inequality are fundamental to understanding UK society, including, and importantly, the education system in which class inequalities are reproduced. Class structures the everyday lives of people through economic, social and cultural inequalities and access to resources. As Andrew Sayer reminds us class “affects how others value us and respond to us, which in turn affects our sense of self-worth” (2005: 1). The study of social class—once dominant in UK sociology—went into retreat during the 1980s and 1990s due to several factors. Sociological discourse increasingly focused on individualism and also on postmodernism and its dismissal of grand narratives. Challenges also came from feminists who criticized the use of male occupation in a family as a way of defining a person’s social class. While sociologists like Pahl (1989) dismissed class as an outdated concept for characterizing people’s lives other sociologists began to re-introduce and re-assert class into the discipline such as Skeggs (1997), Savage (2000), Sayer (2005) and within adult education through the work of Jane Thompson, Ian Martin, Rennie Johnston and others. As Skeggs poignantly stated:

To abandon class as a theoretical tool does not mean that it does not exist any more: only that some theorists do not value it ... Retreatists either ignore class or argue that “class is an increasingly redundant issue”.

Skeggs (1997: 6,7).

The new debates and theories on class took into account the changed socio-political situation to include social, cultural, and symbolic dimensions of class (Bourdieu, 1984) while recognizing that ownership of the means of production and economic capital still continue to be important aspects of social power. Feminists also contributed to the discussion on the changing approach to class by pointing out that gender interacts with class modifying class inequalities.

Class is both a subjective and objective experience located in a historical specificity. While social, economic, political and cultural structures identify a person’s social class people, individually and collectively, are subjectively conscious of class in everyday interaction. Through agency a person may act upon their objective position to make changes to their lives. In our research we were interested in how both class and gender shapes identities in the context of higher education and how “class shapes embodied experience and practical sense” (Finnegan and Merrill, 2017: 309).

In our analysis of class and adult students’ experiences in HE we draw on the work of Bourdieu while also acknowledging that other scholars have used Bourdieu in similar research contexts such as Skeggs (1997) and Reay (2003). Bourdieu’s work is useful and inciteful to us because of his work on the social reproduction of class and identity, habitus, capitals, dispositions and fields (in this case university) as well as his study on universities—*Homo Academicus* (1988). The concept of habitus allowed us to explore how the social and cultural capitals of working-class women students enables them to cope and adjust to or not to the symbolic and intellectual capitals of the university. The context of the research for both projects was an elite university whose culture was different from that of the women students. Middle-class students because of their higher levels of cultural and social capitals, as Bourdieu elicits, are more likely to be “fish in water” while working-class students may find themselves as being “fish out of water”. (And some of the women in our studies did refer to themselves as being fish out of water). A person’s habitus is a culture which shapes how they view the world, their behavior, language and lifestyle. Habitus is linked to disposition whereby through socialization in the family and school, for example, a person learns how to present themselves within a particular habitus in everyday life. As other researchers in our project explain:

Bourdieu’s ideas about forms of capital and the ways they operate in specific fields offer a tool for understanding the enduring impact of social inequality in students’ lives. Stories are clearly formed by lived experiences of social power.

West et al. (2013: 122).

Habitus and the levels of cultural and social capitals locates a person’s position or “a sense of one’s place” (Bourdieu, 1990: 131) in relation to others and the social structure. While habitus reproduces and determines an individual’s class position and social trajectory Bourdieu acknowledged that it is not necessarily static and can be transformed through agency:

Habitus is not the fate that some people read into it. Being the product of history, it is an open system of dispositions that is constantly subjected to experiences and therefore constantly affected by them in a way that either reinforces or modifies its structures.

Bourdieu and Wacquant (1992: 133).

A note on methodology: biographical approaches

Biographical approaches were at the heart of our research (for all partners) as, in the tradition of feminism, we wanted to place the women at the center of our research by giving them voice, enabling them to tell their stories as:

... such methods offer rich insights into the dynamic interplay of individuals and history, inner and outer worlds, self and other. We use the word "dynamic" to convey the of human beings as active agents in making their lives rather than being simply determined by historical and social forces.

Merrill and West (2009: 1).

Biographical research importantly encompasses a humanistic and subjective approach to research (Plummer, 2001). Within European adult education research biographical methods are popular (West et al., 2007) fueled by the "biographical turn" (Chamberlayne et al., 2000). It marked a turn away from positivism and quantitative research which reduced and dehumanized people to numbers and statistics. The UK team drew heavily on feminist approaches to biographical research as well as symbolic interactionism.

Feminist research challenged malestream sociology by stressing that women's lives are also worthy of research (Smith, 1987) and in doing so questioned who has the power to construct knowledge. For Reinharz "biographical work ... draws women out of obscurity, repairs the historical record ..." (1992: 126). Challenging gender inequality is at the core of feminist research. Biographical research in general connects the past, present and future, the private and the public and the macro, meso and micro. We embrace the work of C. Wright Mills (*The Sociological Imagination*, 1957, Reprint in 1971) in which he links, biography, history, social structures and individual agency through the concept of the sociological imagination.

A key contribution by feminists to biographical research lies in their approach to interviewing. In giving voice to women interviews have the potential to be powerful and empowering enabling their story to be heard and for someone to take interest in it. Such interviews are both dialogical and creative. Importantly biographical interviews are a form of learning and a social process. Oakley (1981) stresses that interviews should be more like a conversation thus breaking down, as far as possible, the power relations between the researcher and the researched, and lead to building trust and a democratic relationship. The interview process is both a subjective and inter-subjective one so that the researcher is also part of the story. As Stanley and Wise state: "Personhood cannot be left out of the research process ... We see the presence of the researcher's self as central in all research" (1993: 161).

For us biographical interviews generate thick description or a "good story". "By good stories we mean narrative material that is both rich in detail but also experientially inclusive and reflective in character" (Merrill and West, 2009: 113). At first sight a biographical interview appears to be individual but in reading all the stories shared experiences of gender and class, for example, are highlighted as well as the collectivities (Merrill, 2007). Biographies also reveal the interaction of structure and agency in people's lives although at certain times one may be more dominant than the other. The stories of the working-class women we interviewed in HE illuminate the role of agency and structure in shaping their learning experiences and identities. Agency was used in the act of deciding to study at university but once in the system constraining factors, for some, such as lack of finance took over impeding their studies. Experiencing, coping and drawing on one's biographical experiences is a biographical learning experience, or as Alheit and Dausien term it "biographicity". We learn from our past biography and learning is part of our biography so as Alheit and Dausien assert "without biography there can be no learning, without learning there is no biography" (2002: 15). Telling life stories are a powerful tool for raising critical consciousness about the role of inequalities such as gender and class. The next section explores and shares the stories of the working-class women we interviewed and the centrality of the intersection of gender and class in their biographies. In order to understand present lives and hopes for the future it is essential to look at early life influences such as family and school in order to understand why they chose to return to education as an adult. We then explore their experiences of learning in an elite university and their transition into the graduate labor market and their expectations, emotions and hopes tied up with these processes.

In the RANLHE project different cohorts of students were interviewed: those in their final year, those who left but later returned, those that dropped out as well as following through a cohort from their first to final year of study (100 students in total). With the EMPLOY project a smaller sample of adult students were interviewed—40 in total. Thirty of these were undergraduate students and the other ten were graduate students. A small sample of the undergraduate students were interviewed at the end of their degree course and some for a third time a year after they left university. Most women were in their thirties or forties. All except one woman were studying on a Social Studies degree course designed for local adult students.

Experiencing HE: gender and class

Class and gender are dominant aspects of a person's identity of how they see their self and their self in relation to others and in society. Some sociologists have argued that collective identity, (an aspect of the UK working class), has been replaced by

an individual identity (Beck, 1992; Giddens, 1991). Yet others argue that there is always a collective dimension to identity (Ferguson, 2009; Jenkins, 2000) as it is shaped by personal, social and institutional processes. Berger and Luckmann also asserted that “identity is a phenomenon that emerges from the dialectic between individual and society” (1973: 195). The stories we collected, although individual, illuminated shared classed and gendered experiences which in turn shaped identities of themselves as non-traditional students. A person’s identity is linked to biography as it is shaped and constructed through past and present experiences (Ferguson, 2009). Working-class students imagine a future of who they want to be and become. A university is a transitional space between past and future lives. It is also a temporary and bounded space and place:

A transitional space, therefore, implies being in-between in terms of identity whereby an individual lets go of part or all of their old identity and changes to assume a new or modified identity.

Merrill (2012: 28).

Early life experiences

In both research studies many of the women were of the generation who experienced a very gendered education system at school. Working-class girls were expected to leave school at the earliest possible age and transition into a job before getting married and having a family (Spender, 1989). Some were resentful with their parents and teachers for not encouraging girls with their education:

... it wasn’t until later that I felt quite resentful about the experiences I had at school ... I just felt that there was a lot of potential that I had that was totally wasted because assumptions were made about me. Too young at the time to know but I do feel it came back to my background and my family and where I lived and that influenced how they treated me and that’s why college never got mentioned.

Paula.

Cathy despised her father for treating her differently to her brothers in relation to education. She said “I am still bitter toward my father for not giving me the opportunity because both my brothers were”. Sarah had wanted to stay on at school after the age of 16 (first possible leaving age) but accepted her fate as a girl:

My dad got me a job in a hairdresser’s and that’s where I sort of stayed because I’d wanted to be a hairdresser when I was seven so that means—you want to be a hairdresser for the rest of your life.

Soon after leaving school she had a child and continued working as a hairdresser but experienced a restless desire to return to education and achieve.

Going to university was an opportunity to prove to themselves that they could achieve educationally, and move away from the gender and class restrictions of their childhood. This was important to Sue, who as a single parent, wanted to obtain a better life for her and her children:

I did my degree to prove something to myself. To get a degree that I should have got when I was younger. So to prove to myself that I can get that qualification and for my children as well so that they would think it’s the norm.

Other women, such as Mary, were bored with doing jobs which were unskilled and unfulfilling. Mary worked in a chip shop and could have had promotion to chief fryer. This was a turning point moment (Denzin, 1971) as she thought “no thanks and I thought I need to leave this place because otherwise I’m going to be here when I’m their age” (other women workers).

For some women returning to education was an escape from an unequal relationship in the home and domesticity. Entering HE was a way out of this situation, doing something for themselves and the act of doing this led, in some cases to divorce. The decision to return to education involved reflecting back on their past and present lives and actively wanting to change their lives for the better:

Through agency they were reflecting, constructing and re-constructing their biographies to adjust to transitions and the changing realities of their private and public lives and the structural constraints experienced in communities. It is both a personal journey and sometimes a collective one with other women, in which they reflect upon their lives as women in the public and private domains struggling for change and transformation.

Merrill (2003: 135).

Experiencing university life

The women were studying at an elite university and as adult working-class women they found themselves in a minority. Class consciousness was raised through interaction with lecturers, middle-class students, academic language and knowledge and institutional ethos and culture. In elite universities working-class students “stick out” and many become aware that they are the “other” so that: “Working-class students are, therefore, very often arriving at quite traditional universities and possess different cultural capital and habitus to those of middle-class students and institutions” (Finnegan and Merrill, 2017: 14). One woman used Bourdieu’s term and described herself as “being fish out of water” while Julia stressed that in seminars “I definitely felt like I was in a different class to most of the people I was learning with—that was quite clear”.

However, the fact that it was an elite university was one of the reasons why they applied to the university (there is another university in the city) as they felt its status would help them in the graduate labor market. Sharon, for example, applied to study law and on being accepted stated:

Yeah it was brilliant, it was the best thing ever. I was just so happy that I got into X because I didn’t want to go anywhere else and I just felt so grateful. I was like “oh my God I can’t believe I’ve got into the top five universities from coming from nothing”.

Sharon had also applied to the other university in the city as a fall back: “I didn’t want to go to Y anyway but I thought if I don’t get in to X I need somewhere to go”. She had been brought up by foster parents since the age of twelve after her father murdered her mother but became homeless at the age of 16 and a single mother at the age of 17. She began her degree in her late thirties and before then worked in various jobs and also studied to get qualifications including an Access course (an Access course prepares adults for entry to university) as she was determined to change her life. The choice of a law degree stemmed from her childhood experiences.

Language and vocabulary were key issues in relation to class and the experience of learning. Anne felt herself to be different from the younger middle-class students.

I find it hard and I’m really sort of aware of the way—how different I speak. They’ve got amazing vocabularies and you just think, God you sound brilliant and then I just go red. I just can’t get my words out. I just lack confidence I suppose.

For Jenny seminars were also a situation where she lacked confidence but devised a strategy to try to deal with it:

I cannot do that and made worse by the fact that these young people in the class were very intimidating and I’m absolutely sure they didn’t mean to be. They were upper class. I used to sit and look at them and think well you know I’ve got so much experience that you haven’t got.

Gender and class

Experiences at university were also gendered and classed, as Mary’s quote illustrates, the lives of the younger and mature students were completely different:

They come from different backgrounds and that’s when I found I couldn’t speak. In the module Politics and Food, we (the mature students) were talking about school dinners and were saying that they had to be good because this is the only hot meal they get and they couldn’t understand that. Daddy had bought them ponies and daddy had got them this car.

Unlike male adult students the women had to juggle and cope with undertaking multiple roles which often made finding time to study difficult (Merrill, 1999). They had to try to balance the different roles and this sometimes meant not being able to put themselves first. Some felt guilty about not being “a good mother”. Others studied late at night after the children had gone to bed. Mary a single parent (divorced) with two children explains:

Whenever I can. I study in the evening because my oldest is always on his Xbox and my younger lad plays out ... they’re good kids and at weekends they go to their dad’s every second weekend so that’s good because I get a complete weekend if I want to go to the library or ...

Sue also talked about the problem with time since beginning her studies:

It’s always a challenge with a little one (child) ... I had to work out when it was best for me to study and just all the other stuff that comes with being an adult with education ... Not when do I spend but what time do I spend with Pete and Emma and how much time do I put in, how much time do I put to washing up and ironing and hovering?

Although wanting to do a degree she had, like others, self-doubt about her ability to study at this level:

It's that whole fear of not being able to actually do it. I can't do a degree. I'm not clever enough and can I really go without a full wage now? I guess just all the fears when you get older and realize what you could lose and what you could gain and then obviously with family as well. I was six months on (pregnant) when I started the degree so it was like if I'm going to do this it has to be now. I had to know that I had the support of Pete like a 150% to get through this. I can quite definitely say if I hadn't had his support I probably wouldn't still be sat here right now. There have been times when I've gone "I just can't do this anymore".

Sue.

Sue was unusual in having the support of her husband. Being a student and a single parent brought other difficulties and obstacles to completing a degree:

Being a lone parent is very, very difficult—not having the support, the family support at home and finances again very, very difficult. If you're worrying about silly things like whether you've got enough petrol to drive into university or stuff like that then that really hinders your learning so much. It did get to the stage where I was struggling to even pay the utility bills and buy the food and it seemed ridiculous. I was having an education, having a university education but I just couldn't afford to.

Julie.

Age is also a factor which results in mature students experiencing university life differently as Sue found in her sociology seminars but not always in a negative way:

It was a bit weird at first because obviously I'm the old one in the room and I think some people occasionally thought I was the lecturer rather than a student but actually just through seminars they were actually really encouraging to me. The amount of people who were like you're a wife, and a mother and a student, how on earth do you do this?

Studying at university can distance them as an individual from their family and friends in terms of class and how others view them as they see that person as "getting above their station". Julie who lived on a council estate (social housing) in a deprived area of the city encountered disapproval from her family and friends:

I couldn't talk about university to other mums as I walked to school because I felt that they had snubbed me—"Look at you with your big briefcase". It was really tricky to explain to people why I wanted to progress myself. I withdrew from my friends on the estate a little because I found it hard to explain to them why I wanted something different but I understood why they didn't or why they were happy in the situations they were in.

Julie's family also distanced her as they could not understand why she wanted an education. In UK working-class terms she was "getting above herself" and being disloyal to her class in wanting to "better herself". This reaction by her family was very emotional to her. As Hoggart (1957) explains it is an isolating experience. Although she was "getting out and getting away" (Lawler, 1999) Julie continued to subjectively define herself as being working-class even after she obtained her degree. She had no desire to become middle-class as the women in Lawler's study yet she was caught between two cultures—her working-class one and her academic one. Being working-class was embodied in her identity. She had "got out" but only a little bit. While she had observed the middle-class world at university she did want to embrace it.

Transitions and the graduate labor market

Transitioning to the labor market brought about a different set of experiences for the women making them aware of inequalities in relation to gender, class and age. However, they did feel that having a degree from a top university gave them an edge over adults from other universities as Sharon stated earlier. In her second interview she felt it was a reason that she got the job as a PA in a law firm although it was a lower level job than Sharon had hoped (she got a low level mark for her degree):

Putting X on my CV got me the job because the first thing they said in the interview was "X—that's a very good university. How did you get in there? What did you do? And that basically got me the job."

She elaborated further that she was accepted by the solicitors at the firm because of the university she went to as she was asked

What university did you go to? And whenever you say X they gave an exclamation of surprise ... "Okay", it's as if you are in a different light all of a sudden. Because they had all been educated at Eton and Oxford and Cambridge so they felt I fitted in because I'm from X. If I had told them I had been to Y (the other university in the city) I'd have been cut out.

Although she was accepted there was also an element of surprise that a working-class women student had studied at X.

Increasingly employers are expecting students to gain work experience before employment. Most placements are unpaid and take place during the university vacation. For the women in our study this was not possible because of childcare responsibilities or the need to earn money and often the placements are not local:

Most of the graduate schemes that are available are for people without responsibilities. I can't go travelling and leave my son at home ... There doesn't seem to be any niche for graduate schemes that are solely based locally. The jobs I've looked at, they're looking for people that are flexible and are willing to work all the hours god sends and I have commitments but that isn't taken into account for the mature student in the job market

Jane.

Gaining relevant work experience is, therefore, difficult and this puts women at a disadvantage on the job market:

And I find with some places now, especially where I'm looking at, they want the qualifications but they also want the experience to go with it and they're saying you need ... How on earth do you try and get both at the same time as well as everything else you've got to do and that's what I find highly frustrating sometimes.

Sue.

There was a concern also identified that employers are more likely to favor younger graduates:

Yet at the end of this year I will have a degree but looking at my age and looking at the students—so many young students with the same degree as me when it comes to employment. Employers—maybe they will say “Yes you have your degree expertise but your age” and would rather be looking at someone younger than me.

Another student identified that within the legal profession examples of social and cultural capital were pervasive in securing employment:

Some of the students I've spoken to their parents are partners in solicitors so obviously they're going to walk into a job aren't they? Definitely down the barrister route—it's definitely about what private school you've been to. I think money definitely because if you haven't got money you're just not going to the Bar really are you. It costs too much money. Their course is £18,000 ... it's just not an option

Sharon.

In the context of these challenges students were keen to stress the need for employers to appropriately value the qualities that they bring as mature learners to an organization:

So I think a lot of employers must realize that non-traditional students bring something different to the table, so we've got life experiences as well.

These broader “life experiences” are often complemented by work experience that evidences their commitment and reliability:

I think the bonus about being a non-traditional student—well for me anyway—I've had the experience of work for quite a number of years so already on my CV it looks like employers can see that I am hard working and I have worked so I think that's already a bonus.

Sue.

However, the commitment to family and place restricted many students from being able to offer the so-called “flexibility” that many employers seem to value:

Friends of mine have done English degrees and (one of them went to work in the English quarter in America he's) travelled the world on the basis of that degree ... Non-traditional students don't have the luxury to do things like that. It's like the internships and stuff like that. I could have got a job with UPS on an internship, fast-tracked through to management but that means doing 6 months say in Northumberland and 6 months in Scotland and then maybe a month in America and I can't do that

Jane.

Summary

As stated earlier higher education is a transitional and temporary space in which identities are re-worked and re-shaped as a result of the educational experience. Despite the feeling of being the other in the middle-class university environment there was also a sense of achievement even though there were struggles on the journey but also belonging in some way:

I can't explain that feeling of not just pride but about being part of the University, that you feel part of something ... I'd actually come to the end of something quite brilliant and I should feel really, really proud.

Julie.

Often the process of “becoming educated”—of adapting and succeeding—can later raise issues of belonging in relation to the self, family and friends’ (Finnegan and Merrill, 2017, 320).

The women’s voices above offer an insight into their experiences of learning as a working-class woman in HE and beyond into the labor market and how this was shaped by issues of gender and class. Our research indicates that studying does bring personal, social, economic and academic benefits and can change the lives of women in some way, despite being sometimes a risky business (Reay, 2003). Importantly universities act as a transitional space enabling women to reflect upon their identity as a working-class woman and reshape and transform themselves. The motivations for entering HE centered around “doing something for myself”, finishing their education and proving to the self that they are capable of studying. There is also the desire for a better life in material and employment terms. This was particularly the case with the lone parents in the research as they wanted to improve the quality of life for their children and move out of the deprived areas of the city. The women wanted more interesting jobs which will engage and fulfill them. Their stories, while individual, were also collective highlighting similar experiences as well as illustrating the significance of the interaction of agency and structure in everyday life.

Although universities are now more diverse universities are not a level playing field as they are a site where inequalities are experienced and reproduced. Significant cultural, social and financial differences are experienced by adult students. Their cultural capital and habitus is different from that of middle-class students and the institution (Bourdieu, 1984). Working-class women have to learn to adopt and cope to avoid becoming a “fish out of water”. Issues of inequalities persist into the graduate labor market where they experience gender, class and age discrimination even if they have a degree from a top university. Despite these inequalities the women valued the education they received and had no regrets in studying for a degree. While it may not have guaranteed them upward mobility (Tomlinson, 2008) the experience had nonetheless enriched them. But one aspect of their lives remained constant—defining themselves as working-class women. Universities and employers, however, need to recognize and address the inequalities which adult students face in order to offer a more level playing field.

Deconstructing predominantly white cultures

Student affairs practitioners face many hurdles as they try to create inclusive learning environments conducive to student academic success and psychological wellbeing. These barriers include role strain (Goode, 1960), macroaggressions (Sue et al., 2009), and *onlyness*, which means being the only individual performing the job from the one racial and ethnic group (Harper, 2013). In order to cope with these challenges, student affairs practitioners find themselves caught between a rock and a hard place to meet their job expectations in predominantly White cultures. Specifically, student affairs practitioners wear a white mask as a survival mechanism in order to meet pre-existing professional standards in predominantly White universities (Nguyen and Duran, 2018). Nevertheless, whiteness or masquerading as White is emotionally burdening for people of color trying to enhance diversity on campus (Matias, 2015).

According to Nguyen and Duran (2018), whiteness is defined as “an ideology wherein society considers dominant cultural norms as neutral, and anything outside of those standards is *othered* – seen as deviant, strange, or unusual” (p. 114). This means that whiteness is an already existing social construct that refers to a privileged group who has power and influence over others in terms of social, political, and economic decision making (Cabrera, 2014). In today’s workplace, whiteness is deeply rooted and manifested covertly (Nguyen and Duran, 2018).

In order to combat whiteness and deconstruct predominantly White cultures, Nguyen and Duran (2018) recommended a number of strategies that include the following:

1. Creating an inclusive community: Student affairs practitioners should establish common ground with culturally different others to process the impact of whiteness. In doing so, stakeholders of diverse racial and ethnic backgrounds learn about different cultures and meet halfway.
2. Promoting dialogue: Student affairs practitioners should encourage people of color to share their experiences with their White counterparts to adjust existing preconceived notions about minority groups. This form of dialogue gives voice to marginalized stakeholders through counter-story-telling that not only acknowledge the legitimacy and authenticity of people of color, but also helps them “reframe the dominant narrative about professionalism and whiteness in student affairs” (p. 119).
3. Encouraging cross-racial friendships: In addition to engaging people of color in dialogue, student affairs practitioners are required to promote a culture of friendship whereby all students create a healing space of validation and understanding that ultimately enhances racial climate and diversity on campus.

Next, a presentation of the preliminary findings of a qualitative, phenomenological case study that explored student affairs practitioners’ perceptions of the strategies they implement to deconstruct predominantly White cultures and create racially inclusive environments that promote equal representation of minority students and enhance their learning.

Background of the study

The role of student affairs practitioners is to create diverse learning environments that provide students with cross-racial engagement opportunities, enhance their learning experience, and expose them to new learning paradigms that could interrupt long-standing segregation trends in the society. In an attempt to improve student affairs practitioners' multicultural competence and promote equal representation of minority students, many universities and colleges developed and embarked upon multiple diversity programs and awareness initiatives. Nevertheless, these initiatives were not successful in transforming segregated learning environments into inclusive ones because institutions of higher learning often fail to transform their espoused values into enacted ones (Karkouti, 2016; Manning and Coleman-Boatwright, 1991). According to Baxter-Magolda (2003), predominant White cultures explain why student affairs practitioners' efforts often fall short in transforming their institutional cultural climate. These cultures are persistent in that they serve as a pseudo-transformational force that intensifies discrimination and racism, undermines public and private spheres including postsecondary education, and widens the gap between different social classes.

White culture is believed to dominate all facets of campus life by defining what constitutes acceptable practices, behaviors, and principles (Karkouti, 2016; Manning and Coleman-Boatwright, 1991). For example, personal and professional qualities that differ from the established norm are rejected and considered unusual, intrusive, and unacceptable. Therefore, minority students become subject to alienation in predominantly White institutions (PWIs) where their way of being, identity, and culture is disregarded in the institutional mission (Heath, 1983). Further, research indicates that privileged and White predominant cultures create hostile or anxiety-laden learning environments where racial tensions among students, faculty, and staff prevail (King et al., 2011). Therefore, in order to help educators enhance diversity on campus, this study explored student affairs practitioners' perceptions of the strategies they implement to deconstruct predominantly White cultures and create racially inclusive environments that promote equal representation of minority students and enhance their learning.

Conceptual framework

In an effort to enhance diversity and multiculturalism on campus, Ortiz and Rhoads (2000) supplied a five-step multicultural education framework that helps student affairs practitioners deconstruct White cultures, create inclusive learning environments, and promote equal representation of minority students. In addition to student affairs practitioners, the multicultural education framework also helps students understand the concept of predominant cultures and their role in its obliteration or development (Baxter-Magolda, 2003). According to Baxter-Magolda, students participating in Ortiz and Rhoads's multicultural education framework learn "who they are becoming [which] is central to success in learning, career decisions, understanding diversity, and interacting peacefully with others" (p. 244). Table 1 provides a comprehensive summary of the framework's components.

Research questions

The primary research questions that guided this study are:

1. What are student affairs practitioners' perceptions of the strategies that deconstruct predominantly White cultures on campus?
2. What are student affairs practitioners' perceptions of the strategies that create inclusive learning environments and promote equal representation of minority students?

Table 1 Multicultural education framework (Ortiz and Rhoads, 2000).

<i>Transformational steps</i>	<i>Description</i>
Understanding culture	As a first step, students learn more about their culture, explore their identity and practice how to interact with diverse populations.
Learning about other cultures	This stage teaches students how to acknowledge culturally different others. It shows students that cultural differences are authentic and helps them understand others' behaviors, traditions, and virtues.
Recognizing and deconstructing white culture	In this stage, students explore how white culture defines acceptable practices, behaviors, and principles. Regarding deconstructing white culture, students should engage in dialogue to understand, explain, and show how white culture affects their lives. White students could be uncomfortable in this stage because it teaches them how to confront their own racial identity.
Recognizing the legitimacy of multiple cultures	After deconstructing white cultures, students start acknowledging other cultures. This will help students establish a common culture that values coexistence and promotes diversity.
Developing a multicultural outlook	During this stage, students learn how culture, society and individuals are interrelated and interconnected. Specifically, they learn how diversity and multiculturalism create pluralistic societies where all people are equally represented.

Methodology

Phenomenological research helps interpret and explain sophisticated phenomena through understanding people's lived experiences (Sofaer, 1999). Therefore, a phenomenological approach was deemed appropriate for this study that explored student affairs practitioners' perceptions of the strategies they implement to deconstruct predominantly White cultures and create racially inclusive environments that promote equal representation of minority students and enhance their learning. Willis (2007) explained that phenomenological research helps understand a specific phenomenon by drawing on people's personal experience, and qualitative interviews serve this purpose. According to Patton (2002) interviews "find out what is in and on someone else's mind" (p. 341). Therefore, in order to establish their understanding of the strategies that create inclusive learning environments, semi-structured interviews with 10 student affairs practitioners were conducted at a single private higher education institution in the Northeast United States.

Participants and setting

Polkinghorne (1989) explained that interviewing 5 to 25 participants with direct experience of the investigated phenomenon suffices a qualitative study. Given there is no single rule regarding sample size in qualitative research, the researchers interviewed 10 student affairs practitioners, six of whom were female administrators. This study was conducted at a single mid-sized, racially diverse private higher education institution in the Northeast United States where its largest minority group on campus constitutes 28% of the student body with a diversity index of 0.73. Table 2 provides a brief summary of the sample's demographic data.

Data analysis

Interview data were thematically analyzed in the context of the main research questions which involved "breaking down, examining, comparing, conceptualizing, and categorizing data" (Strauss and Corbin, 1990, p. 61). Thematic analysis helped identify common themes, patterns, and connections between datasets. To enhance the rigor of the research process and establish trustworthiness, study participants reviewed their responses and verified the accuracy of the results. The findings derived from data analysis are presented in the form of narrative passages in order to represent participants' perceptions of the explored phenomenon.

Limitations

As with any study, this research has its own limitations. Given the qualitative nature of the study, the findings are not generalizable but provide valuable insights into the strategies that deconstruct predominantly White cultures and create racially inclusive learning environments. The limited sample size also restricts the application of results to a limited population of student affairs practitioners serving in the field of higher education in the Northeast United States; however, the author believes the findings that are presented in the next section may find applicability among higher education administrators more broadly.

Representative preliminary findings

Student affairs practitioners are uniquely situated to raise awareness of how White culture often determines the degree to which non-White students experience anxiety. In addition, they are also able to disrupt white students' current beliefs and values. The findings will identify approaches and positions that will further inform the field for increased equity and inclusiveness in higher education. Next, representative findings are presented in five sections.

Understanding culture: acknowledging identity, values, and beliefs

According to [Ortiz and Rhoads \(2000\)](#), students must know their own culture and acknowledge their identity prior to learning how to socially interact with diverse populations. In an effort to help White students understand themselves as social agents and identify their social and cultural background, student affairs practitioners work closely with faculty and staff to create professional development programs that teach students how culture shapes the daily aspects of their lives. In support of this argument, one participant explained:

[Along] with university professors and social workers, each semester, I meet with new students, graduate and undergrads, and teach them about their culture and how it is supposed to help them construct identity and how this relates to diversity, pluralism, and democracy.

Another participant mentioned, "What matters for me the most is showing new and existing students how their beliefs and values welcome diversity and how they support admiring and acknowledging different others ... I conduct workshops on this each semester."

Learning about other cultures: A small step brings you closer

[Ortiz and Rhoads \(2000\)](#) explained that learning about other cultures is the second step toward deconstructing predominantly White cultures. Specifically, the authors argue that students at this level start creating an understanding of other cultures, traditions, and beliefs. Findings from this study indicate that student affairs practitioners provide students with cross-racial engagement opportunities where they get to know students of other cultures and ethnicities, which in turn help them recognize the legitimacy of culturally different others. Speaking about the importance of this stage, one student affairs practitioner stated, "We make sure that sororities and fraternities are as diverse as possible and that they reach out to minority students to engage them in various university and community-based activities that teach all students they are one." Another student affairs practitioner explained, "I make sure that I host students of different backgrounds, colors, and ethnicities every other week on campus where they all have free lunch and I make sure that self-segregation does not exist in the room."

Recognizing and deconstructing white culture: overcoming oneself breaks cultural barriers

This step is best described as the process through which students learn how to confront their own identity and belief system in order to enhance learning and success. It is usually done by facilitating dialogues between students, faculty, and staff ([Ortiz and Rhoads, 2000](#)). According to study participants, engaging all students in a dialogue regarding the importance of diversity and multiculturalism helps students adjust common misconceptions about different races and ethnicities, aids students overcome possible existing resentment against others, enhances campus racial climate, and sends a clear message to the public that diversity matters and is not brought to light for public display only. In support of this argument, one student affairs practitioners mentioned:

When we constantly stress the importance of diversity in everything we do and when we talk and consider students' input regarding creating inclusive learning environments communicates our values as a racially diverse school. Therefore, we tend to create extra-curricular activities and co-curricular programs conducive to inclusive learning in order to leave no one behind ... This is a great chance for all of them to interact, share ideas, and engage in change.

Another student affairs practitioner said:

My colleagues and I make sure that we engage all stakeholders in constructive and effective conversations that transforms our community to a melting pot and promotes minority students' interests on campus ... This helps us create policies that enhance the representation of minority students.

Recognizing the legitimacy of multiple cultures: Acceptance fosters coexistence

The main purpose of this stage is to alter existing structures that value a common culture to one that promotes diversity and coexistence (Ortiz and Rhoads, 2000). According to study participants, transforming the organizational culture starts at this stage when they proactively examine their institutional culture in order to determine the factors that desegregate their campuses, reduce racial hostility, and construct racially affirmative environments. Speaking about the importance of this stage, a student affairs practitioner mentioned:

What we usually do at this stage is preparing a comprehensive report to the administration after assessing our campus climate and make recommendations to improve our admission policies, increase need-based financial aid programs, integrate diversity in all academic programs, and increase hiring and promoting faculty of color ... This, of course, cannot be done without senior leadership commitment. We are lucky that the Board of Trustees is on our side and what we do informs policymaking and tells everyone that they matter here.

Developing a multicultural outlook: rethinking worldview nurtures democracy

This final stage is best described as the process through which students learn about the power dynamics of diversity and how different cultures build democratic and pluralistic societies (Ortiz and Rhoads, 2000). According to one student affairs practitioner, "My colleagues and I never spare an opportunity to explain how different cultures are interrelated and interconnected and how each one complements and adds to others. This is really helpful as we try to show where America gains its strength." Another participant explained, "When students of a particular group or race learn about others, their virtues and values, they become more aware of themselves and see the bigger picture, pluralism."

Conclusion and recommendations

Throughout this study, student affairs practitioners have consistently expressed their belief in their role to change campus life no single culture is represented to the exclusion of all others. The informants also maintained that their perceptions of a campus inclusive of all cultures is also one that reduces anxiety about academic and social life. At the same time, they project and hold the belief that the campus values diversity ideally and in practice.

Student affairs practitioners are uniquely situated to understand the perspectives of the student body at any given institution. Moreover, they are in a position of strength to disrupt the thinking that leads to one culture overshadowing and excluding other cultures from campus life. The role of professors, administrators, and other campus stakeholders should not be understated. However, the persons most able to form robust perceptions of the anxieties, fears, and also successes that come with greater understanding of diverse student population enrolled at university and who can expect that their own cultures are a significant part of campus life.

Today, more than ever, student affairs practitioners should show a genuine concern for all students if they are to deconstruct predominantly White cultures. Creating a safe and welcoming learning environment that recognizes the legitimacy and authenticity of each student not only enhances campus racial climate, but also sends a clear message to the university community that diversity truly matters. Student affairs practitioners can achieve this by:

1. Establishing a sincere student-to-administrator/teacher relationship that alleviate student anxiety and stress.
2. Teaching faculty, administrators, and students how to wear hats of humor, patience, understanding, and love.
3. Building a coalition of trust between university stakeholders and garner their support for institutional and policy-level diversity programs.
4. Endorsing openness, transparency, and accountability in each decision they make.
5. Establishing an open door policy whereby students feel welcome to voice their concerns anytime.
6. Bridging the learning gap between different students through differentiated instruction that meets student learning styles and needs.
7. Creating diversity pre-requisite courses whereby all students have to attend before starting their concentration courses.
8. Formulating strategies that increase retention and persistence rates through offering students with all types of support they need during their course of study.

Failing to respond to diversity issues in a timely manner has many implications on students' academic performance and psychological wellbeing. Therefore, it is imperative for student affairs practitioners to strengthen minority students' sense of belonging

through creating a diverse campus community that fosters cross-racial engagement, promotes dialogue across all organizational levels, and welcomes and acknowledges cultural, racial, and ethnic difference. Student affairs professionals are also required to offer professional development programs for faculty and staff if they are to improve cultural sensitivity and ensure diversity responsive teaching that accounts for minority students' learning needs.

Finally, diversity in higher education should not be neglected or brought to light only for public display. Instead, institutional leaders should prioritize multiculturalism, proactively examine their campus racial climate, and constantly endorse social cohesion and national unity programs if they are to create civic cultures inclusive of diversity. As a first step toward accomplishing this ambitious goal, higher education administrators are required to transform espoused institutional values into enacted ones and reconfigure education to include pluralism, secularism, and diversity in all aspects of teaching and learning.

Significance of the study

This study adds to the literature available on diversity and educational equity, specifically, the strategies that deconstruct predominantly White cultures and promote equal representation of minority students. Although data were collected from student affairs practitioners in the Northeast United States, the findings could be of interest to local and international audiences striving to improve the representation of underserved populations in higher education. Further, this study tests the viability of Ortiz and Rhoads's (2000) multicultural education framework in a new context, a racially diverse learning environment in the United States. Finally, findings from this study could serve as a steppingstone for conducting similar research on diversity and multiculturalism at public and private postsecondary institutions in other regions and continents.

Acknowledgments

The author would like to thank Dr. Everard Weber for his valuable input.

Historical background

From their arrival on the shores of the United States, Black people craved knowledge and understood literacy and education as the path to their freedom. These enslaved people pursued many forms of education despite laws, in all Southern states, forbidding them from learning to read and write (Williams, 2005). Several Black colleges were created just before the Civil War, such as Lincoln and Cheyney Universities in Pennsylvania and Wilberforce University in Ohio. These institutions were established through collaboration between free Black ministers affiliated with the African Methodist Episcopal Church in the North and Quakers who supported the abolition of slavery (Drewry and Doermann, 2003).

At the end of the Civil War, the large task of providing education to more than 4 million formerly enslaved Black individuals was coordinated by both the federal government, through the Freedman's Bureau, and many northern church missionaries – of both Black and White denominations (Brazzell, 1992). Beginning in 1865, the government's Freedmen's Bureau began creating Black colleges, resulting in principals and teachers with military backgrounds. During the postbellum period, most Black colleges were so in name only; these institutions, with a few aberrations, provided primary and secondary education. Of note, this approach was also a feature at most historically White colleges and universities—starting with Harvard University—during the first decades of their existence. Missionary organizations—mainly affiliated with northern White denominations such as the Baptists and Congregationalists and some linked with Black churches such as the African Methodist Episcopal and the African Methodist Episcopal Zion—were actively working with the Freedmen's Bureau. Two of the most well-known White organizations were the American Baptist Home Mission Society and the American Missionary Association, but there were many others. White northern missionary societies founded Black colleges such as Fisk University in Nashville, Tennessee, and Spelman College in Atlanta, Georgia. The benevolence of the missionaries was tinged with self-interest and sometimes racism (Anderson, 1988). Their goals in establishing these colleges were to bring Christianity to the freedmen and to rid the country of the “menace” of uneducated Black people. Among the many colleges founded by Black denominations were Morris Brown College in Georgia, Paul Quinn College in Texas, and Allen University in South Carolina. Unique among American colleges, these institutions were founded by Black people for Black people and had an expressed mission to affirm and uplift Black people. Because these institutions relied on less support from White missionaries and White philanthropists, they were able to craft their own curricula without outside influence and control. However, they also were more susceptible to financial instability (Watkins, 2001).

With the passage of the second Morrill Act in 1890, the federal government again took an interest in Black education, establishing public Black colleges (Thelin, 2011). This act stipulated that those states practicing segregation in their public colleges and universities would forgo federal financial support unless they established agricultural and mechanical institutions for the Black population. Despite the wording of the Morrill Act, which called for the equitable distribution of federal monies, these new institutions received fewer dollars than their White counterparts and as a result, had inferior facilities. Among the 17 new “land grant” colleges were institutions such as Alcorn State University and Kentucky State University.

The rise of industrial philanthropy

At the close of the 19th century, private Black colleges had exhausted funding from missionary sources. At the same time, new support emerged, that of White, northern, industrial philanthropy. Among the industry titans who initiated this type of support were John D. Rockefeller, Andrew Carnegie, Julius Rosenwald, and John Slater. These men were motivated by Christian

benevolence, but more so by a desire to control all forms of industry. The organization making the largest contribution to Black education was the General Education Board (GEB), a conglomeration of northern White philanthropists, established by John D. Rockefeller Sr. but led by his son John D. Rockefeller Jr. Between 1903 and 1964, the GEB gave more than \$63,000,000 to Black colleges, a substantial figure, but only a fraction of what they donated to White institutions. Regardless of their individual motivations, the funding system that these industrial moguls established demonstrated a strong desire to control Black education for their own benefit—to produce graduates who were skilled in the trades that served their own enterprises; this type of education was known as industrial education (Anderson, 1988; Watkins, 2001). Above all, the colleges that they supported were very careful not to upset the segregationist power structure that dominated the American South by the 1890s. Black colleges such as Tuskegee and Hampton were showcases of industrial education (Watkins, 2001). It was here that students learned how to care for horses, make dresses, cook, and clean under the leadership of individuals like Samuel Chapman Armstrong (Hampton) and Booker T. Washington (Tuskegee). Learning these types of skills was silly in many ways as Black people already had these skills due to the confines of slavery (Gasman and McMickens, 2010).

The White philanthropists' support of industrial education was in direct conflict with many Black scholars and intellectuals who favored a liberal arts curriculum because it stimulated critical thinking skills (Anderson, 1988; Gasman, 2007). Institutions such as Dillard, Howard, Fisk, Morehouse and Spelman were more focused on the liberal arts curriculum favored by W. E. B. Du Bois than on Booker T. Washington's emphasis on advancement through labor and self-sufficiency (Anderson, 1988; Bieze and Gasman, 2012; Gasman, 2007; Watkins, 2001). Whatever the philosophical disagreements may have been between Washington and Du Bois, the two educational giants did share a goal of educating African Americans and uplifting their race (Bieze and Gasman, 2012). Their differing approaches might be summarized as follows: Washington favored educating blacks in the industrial arts so they might become self-sufficient as individuals, whereas Du Bois wanted to create an intellectual elite in the top ten percent of the Black population (the Black "talented tenth") to lead the race as a whole toward self-determination (Aldridge, 2018; Brazzell, 1992; Gasman, 2002).

In 1915, there was a slight change in the attitude of the White, industrial philanthropists; they started to turn their attention to the Black colleges that emphasized the liberal arts (Anderson, 1988). Realizing that industrial education could exist in collaboration with a liberal arts curriculum, the philanthropists chose to distribute their money and influence throughout the Black educational system. The pervasive influence of White industrial philanthropy in the early 20th century created a conservative environment on many Black college campuses. This environment tended to tolerate only those administrators (typically White men) who accommodated segregation (Anderson, 1988; Gasman, 2007; Watkins, 2001). However, attention from the White philanthropists was not necessarily welcomed by institutions like Fisk University, where protests ensued against autocratic presidents who were thought by students to be mere puppets of the White philanthropists. Despite these conflicts, industrial philanthropists provided significant support for private black colleges up until the late 1930s (Anderson, 1988; Gasman, 2007).

At this time, the White, industrial philanthropists turned their attention elsewhere. In response, Frederick D. Patterson, then president of the Tuskegee Institute, suggested that the nation's private Black colleges come together around their fundraising efforts. As a result, in 1944, the leaders of 29 Black colleges established the United Negro College Fund (UNCF) (Drezner, 2008; Gasman, 2004, 2007; Tucker, 2002; Williams, 1980). The UNCF began solely as a fundraising entity but eventually took on a large advocacy role for Black colleges as well.

Prominent legal cases and HBCUs

Until the *Brown v. Board of Education* decision in 1954, both public and private Black colleges in the South remained segregated by law and were the only educational options for Black people. Although most institutions of higher education did not experience the same fallout from the *Brown* decision as southern public schools, they were greatly affected by the decision (Anderson, 1988; Walker, 1996). The Supreme Court's landmark ruling meant that Black colleges would be placed in competition with White institutions in their efforts to recruit Black students. With the triumph of integration in terms of the law, many began to call Black colleges into question and point to them as vestiges of segregation. Desegregation proved glacially slow, with public Black colleges maintaining their racial makeup into the current day. In the state of Mississippi, for example, the *Fordice* case was held up in the courts for almost 25 years, with a firm and final decision handed down in 2004. The *Fordice* case, which reached the United States Supreme Court, asked whether the State of Mississippi had met its affirmative responsibility under the 14th Amendment's Equal Protection Clause to dismantle its prior dual university educational system. Despite ample evidence to the contrary, the high court decided that the answer was yes. Although the *Fordice* case applied only to those public institutions within the fifth District, it had a rippling effect within most southern states, resulting in sluggish funding for public Black colleges and limited access for African Americans into predominantly White institutions.

Following the *Brown* decision, private Black colleges, which have always been willing to accept students from all racial and ethnic backgrounds if the state laws would allow, struggled to defend issues of quality in a climate that labeled anything all Black as inferior. Many Black colleges also suffered from "brain drain," as Predominately White Institutions in the North and some in the South made efforts to attract the top 10% of their students to their institutions once racial diversity was embraced by higher education.

The 1960s and civil rights

Black colleges began to change significantly in the 1960s and were quite different than those of the 1920s. The leadership switched from White to Black and, because Black people had more control over institutional funding, there was increased tolerance for Black dissent and self-determination. On many private and public Black college campuses, students were participating in sit-ins and protesting against segregation. Most prominent among these sit-in movements were the four Black college students from North Carolina A & T University, who refused to leave a segregated Woolworth lunch counter in 1960 (Morgan and Davies, 2002; Williamson-Lott, 2018).

During the 1960s, the federal government began to have a greater interest in Black colleges. In an effort to provide clarity, the 1965 Higher Education Act defined a Black college as an institution whose primary mission was the education of African Americans. The recognition of the uniqueness of Black colleges implied in this definition led to increased federal funding for these historic institutions (Gasman, 2007; Thelin, 2011).

Federal recognition of HBCUs

The federal government intervened again on behalf of Black colleges in 1980 when President Jimmy Carter authorized and signed Executive Order 12,232, which established a national program to alleviate the impact of systemic racism and strengthened and expanded Black colleges in their efforts to provide quality education. Since this time, every US president has provided funding to Black colleges through this program. President George H. W. Bush followed up on Carter's initiative in 1989, signing Executive Order 12,677, which established the Presidential Advisory Board on Historically Black Colleges and Universities to advise the president and the Secretary of Education on the future of these institutions.

Black colleges today and their environments

As mentioned earlier, the first HBCUs were established in the United States just prior to and just after the end of the Civil War. They were birthed in a time of deep segregation, at a time when most institutions systematically excluded Black people. This makes them unlike any other universities or colleges in the United States. The only peer is the system set up for the non-White population by the South African Apartheid government in 1959. But while there were once nearly 200 HBCUs in the United States, South Africa only created five, including some designed for "Coloureds" and Indians as well as Africans. Now most of South Africa's 'Black' colleges have been merged with nearby historically White institutions (with the exception of the University of the Western Cape, which was established for the "Colored" population) (Green, 2004). In the United States, although there have been a few mergers, and talk of a few more, the majority of HBCUs have maintained the infrastructure of their origins and remain majority African American. As with their South African counterparts, HBCUs always operated under unequal and structurally inferior conditions. Even today, as research demonstrates that some public HBCUs are forced to educate their students with only half the funding given to counterpart Primarily White Institutions (PWIs) in the same state (Boland and Gasman, 2014).

Currently, more than 300,000 students attend the nation's 105 historically black colleges (40 public four-year, 11 public two-year, 49 private four-year, and 5 private 2-year institutions). This amounts to 8% of all African American college students. Overall, the parents of Black students at Black colleges have much lower family incomes than those of parents of Black students who attend Predominantly White Institutions. Many researchers who study Black colleges, however, have found that African Americans who attend Black colleges have higher levels of self-esteem and find their educational experiences more nurturing (Conrad and Gasman, 2015). Moreover, graduates of Black colleges are more likely to continue their education and pursue graduate degrees than their counterparts at Predominantly White Institutions. Despite the fact that only 8% of African American college students attend Black colleges, these institutions produce significant numbers of our nation's African American professors, politicians, lawyers, doctors, scientists, and teachers (Gasman et al., 2017; Gasman and Nguyen, 2019; Perna et al., 2009).

Black colleges in the 21st century are remarkably diverse and serve varied populations (Gasman and Nguyen, 2015; Jewell, 2002; Lundy-Wagner, 2015; Maramba et al., 2015; Shorrette and Arroyo, 2015). Although most of these institutions maintain their historically Black traditions, on average 13% of their students are white, two percent are Latino, and two percent are Asian American (Gasman, 2013). Because of their common mission (that of racial uplift), they are often lumped together and treated as a monolithic group, causing them to be unfairly judged by researchers, the media, and policymakers (Gasman, 2007; Williams et al., 2019). Just as Predominantly White Institutions are varied in their mission and quality, so are the nation's Black colleges. Today, the leading Black colleges cater to those students who could excel at any top tier institution regardless of racial makeup. Other institutions operate with the needs of Black students in the surrounding region in mind. And some maintain an open enrollment policy, reaching out to those students who would have few options elsewhere in the higher education system (Gasman et al., 2010).

Black colleges have particular strengths that other institutions could learn from. These include their ability to propel student into successful careers in the STEM fields, their faculty diversity, and their role in fostering economic mobility for their students. The sections below delve more deeply into these areas.

HBCU contributions in STEM

According to the National Science Foundation, HBCUs confer nearly 15% of all bachelor's degrees (16% in the sciences) awarded to Black students despite making up only 3% of all postsecondary institutions in the US. Xavier University of Louisiana now produces more alumni who go on to graduate from medical schools than any other institution in the country. In fact, along with Xavier, according to the Association for American Medical Colleges, four HBCUs – Spelman College, Morehouse University, Howard University and Florida A&M University – other HBCUs are ranked in the top-20 for supplying the largest percentage of Black students applying to medical school. When we consider that these HBCUs enroll 2–10,000 students and are competing against much larger and more resourced institutions such as the University of Florida (52,218 students) or the University of Texas at Austin (51,832 students), we cannot ignore that HBCUs are doing something profound, which any university committed to diversity and creating a positive learning culture for all students should consider (Gasman and Nguyen, 2019; National Academies of Sciences, Engineering, and Medicine, 2019).

HBCUs generally value collaboration over competition, especially in the STEM fields. At most colleges and universities in the United States, the sciences are highly competitive, deeply individualistic and are built on the idea of “weeding out” students in early classes or being exclusive. As a result of this embedded culture, students often see classmates as competition and don't want to help each other. Such an atmosphere can serve as a deterrent to African Americans, since it tends to reinforce feelings of isolation that these students already experience in classes filled with mainly White men (Gasman and Nguyen, 2019; McGee and Martin, 2011; Ong et al., 2011). At HBCUs, however, students are encouraged to work together and to understand how their success is tied to each other's. They are urged to make sure that their classmates understand the material, to share notes, to work with peers who might be taking longer to understand the material and to socialize with each other in order to build trust in the classroom and around group projects (Conrad and Gasman, 2015; Gasman and Nguyen, 2019).

Diversity in HBCU faculty

HBCUs also provide same-race role models for Black students. Whereas the faculty makeup at PWIs is 76% White, HBCUs have a faculty that is 60% Black with the remaining 40% being highly diverse across the racial and ethnic spectrum (Gasman and Nguyen, 2019; McGee and Martin, 2011). Research shows that when African Americans see someone like them in the classroom and having an opportunity to forge friendships with them, they are more likely to persist in college and in their particular science major (McGee and Martin, 2011; National Academies of Science, Engineering and Medicine, 2019). Gender adds an additional dimension to this. Figures from 2016 indicate that Black women made up only 3% of professors in the US, but 18% of them work in HBCUs. They can therefore act as crucial role models for their Black women students (Gasman and Nguyen, 2019).

HBCUs and economic mobility

Black colleges built the Black middle class in the United States. Although they educate fewer African Americans than they did prior to the end of segregation, these institutions continue to have a profound impact on the students who attend them. Research shows that HBCUs contribute disproportionately to the upward mobility of their students, especially given that the majority (90%) of their students are from low-income households and 71% are eligible for Pell Grants, making them some of the poorest students in the nation (Natheson, Castro Samayoa and Gasman, 2019). Nearly 70% of Black students who enter HBCU from low-income homes attain middle-class incomes after graduation. HBCUs that perform in this manner at a particularly high rate include Tuskegee University, Bennett College, Florida A&M University, Dillard University and Clark Atlanta University. These institutions have some of the greatest percentages of low-income students among HBCUs but still move them to the middle class. The institutions that are able to move students to the highest levels in terms of socio-economic status – meaning moving students from the lowest levels to the highest levels are Xavier University of Louisiana, Dillard University, Prairie View A&M University and Tuskegee University. Of note, some of the most highly ranked HBCUs, such as Spelman College, Howard University, and Morehouse College, propel more than one-third of their low-income students into the top-fifth of income earners. Overall, research demonstrates that African Americans who graduate from HBCUs are less likely to move downward in terms of economic mobility than their peers at Predominantly White Institutions (Nathenson et al., 2019).

The future of HBCUs

Despite a storied history and ample contributions to the continued success of African Americans, HBCUs are constantly questioned about their relevance and importance in the 21st Century (Gasman et al., 2019; Kimbrough, 2011). Those without a deep understanding of their history and current day contributions, make predictions about their demise and often refer to them in derogatory ways, even stating that they “retard” students (Brown, 2013; Butrymowicz, 2014; Carr, 2013; Carter, 2019; Fryer and Greenstone, 2007; Riley, 2010; Smith-Barrow, 2019; Vedder, 2019; Whitford, 2021). However, much like Black people overall, HBCUs have proven resilient with even those HBCUs that have faced seemingly insurmountable problems coming back from the brink. In recent

years, these HBCUs have included Paul Quinn College in Dallas, Texas, Morris Brown College in Atlanta, Georgia, and Wilberforce University in Wilberforce, Ohio. Interestingly, each of these particular HBCUs is affiliated with the African Methodist Episcopal Church and were founded by African Americans for African Americans.

In recent years, HBCUs have garnered more positive attention from media outlets as well as philanthropists, including MacKenzie Scott (Amazon) and Reed Hastings (Netflix) (Anderson and Lumpkin, 2020; Beras, 2020). HBCU leaders have become more vocal in terms of sharing their successes and making sure that the larger nation understands their contributions. In addition, racial turmoil and discrimination has led more students and their parents to look to HBCUs for a college education as they have always ensured that Black lives matter on their campuses. Moreover, many of the most prominent and fresh political leaders in the United States were educated at HBCUs – including Vice President Kamala Harris, voting rights activist Stacey Abrams, and Georgia Senator Raphael Warnock.

Introduction

Undertaking a doctorate can be a highly fulfilling experience, both personally and professionally, and students may wish to study for a PhD for a number of reasons. As a result of an online survey of 1901 Asian and African PhD students, [Fomunyam \(2020\)](#) reports the students' motivations to obtain a PhD to include intrinsic interest, employment considerations, and personal and professional development. Nevertheless, studying for a PhD can be a lonely experience ([Juniper et al., 2012](#)) and students can encounter multiple challenges during their period of study leading to feelings of stress and isolation ([Janta et al., 2014](#)). Students at UK universities may start at two or three different points in the academic year and unless concerted efforts are made by staff and students, the latter may feel isolated and unsupported. This is in contrast to the professional doctorates in which the students begin as a group by studying core and optional modules sequentially, and a community of practice quickly develops. Conversely, there may not be a structured curriculum for PhD study as it is a research degree. Also, much of PhD pedagogy is in the form of supervision by a team, usually comprising an experienced principal supervisor and a novice second supervisor, and the quality of relationships varies, which may impact on students' motivation and progression.

PhD students, therefore, need to be highly motivated and able to manage their time effectively, as well as being capable of completing a degree at doctoral level, while having an effective working relationship with their supervisors who are able and willing to scaffold students' learning on an on-going basis. PhD students may start the program as unconfident individuals and may continue to view their experience as challenging and demanding, with a tendency to worry about whether they will complete on time and attain the required standards. There can be issues related to the student's gender, time, finance, childcare and other caring responsibilities, confidence and so forth. Achieving a balance between home and academic life can be a source of stress, which may lead to dropping out of the program ([Castello et al., 2017](#)). These problems are even more acute in case of PhD students in an environment where studentships in the UK are few and far between and are extremely competitive.

[Maloshonok and Terentev \(2019\)](#), in their research on doctoral students in Russia, note various problems encountered by these students to include transition to a structured model of doctoral education; diffusion of doctoral education's goals; unpreparedness of Russian universities for expansion of PhD education; ineffective mechanisms of student selection; lack of funding and need for paid work; excessive dependence on supervisors; and insufficient study time and skills for meeting the requirement for publications before the date of defense. They acknowledge that some problems correlate with the global challenges, but some are unique to the Russian institutional context.

Yet, studying for a PhD is not a negative experience for all students. [Mowbray and Halse \(2010\)](#) argue that in contrast to the literature highlighting the traumatic and debilitating effects of the PhD, their qualitative study of 20 final year PhD students at an Australian university illustrates that struggles, setbacks and other negative experiences during the PhD can have positive impacts, as they improve the students' experiential knowledge and understanding of the world, making them creative and resourceful problem-solvers. Students in Iran value their student identity and the feeling of being a student despite experiencing everyday necessities and struggles of life and facing considerable challenges in the learning milieu ([Hemmati and Mahdie, 2020](#)).

However, there can be issues for international students in addition to those that are faced by all PhD students. [Son and Park \(2014\)](#) point to the limited availability of resources for international students in Australian universities, the lack of understanding of the challenges and difficulties faced by such students, to include language problems, cultural differences and personal issues, and their implications for the Australian higher education context. In the UK, university guidelines, though helpful, fail to fully address

the requirement to support international PhD students who come to study at a foreign university, having made substantial personal, professional and financial sacrifices (Cree, 2012). Research in the US indicates that most international students persist despite facing problems, as they are motivated by an intrinsic interest in research and teaching, high value placed on an earned PhD from a US university, and high emotional and social cost of withdrawing (Zhou, 2015).

A large percentage of PhD students may already be in employment when they embark on a doctorate, and hope to hone their personal and professional competencies further through doctoral study. Platow (2012) highlights the perceived acquisition of graduate attributes related to post-PhD productivity, and the role that PhD education has in developing the attributes which could be brought to fruition in employment through enhanced productivity. Generally, the gains to society appear to be higher than the gains to the PhD graduates themselves and to their employers. The traditional PhD degree is sometimes viewed as too narrow, the research findings of limited use beyond the student's specialism and does not necessarily guarantee an individual's employment and earning prospects. Sharmini and Spronken-Smith (2020) note that most PhD programs in the UK and Australasia focus on developing disciplinary knowledge and research skills, with the assessment narrowly concentrating on a thesis and viva.

Nevertheless, highly qualified people such as PhDs can enhance other people's abilities, contribute to a pool of knowledge from which other people can draw, and are better at gaining from that pool of knowledge themselves, thus contributing to societal good (Casey, 2009), as the majority of them may already be in employment and making an important contribution to society on an ongoing basis through their PhD research. Universities are able to provide all types of knowledge and skills which can be useful to employees in the workplace, though they also ought to ensure that employers understand the language of academic quality (Basit et al., 2015).

This article uses Bourdieu's theory of habitus as a lens to examine the PhD program at a university. Bourdieu (1990) considers habitus as both a system of production of practices, and perception and appreciation of practices. Habitus produces practices and representations which are available for classification, and are objectively differentiated, though they are perceived as such only by individuals who possess the classificatory schemes needed to understand their social meaning. Reay (2004) notes that the notion of habitus, which is at the heart of Bourdieu's theoretical framework, is complex as it takes many shapes and forms. Habitus is "a constellation of perceptions and attitudes that frame particular actions as possible in different situations. So, habitus acts as both a generative and restrictive mechanism to action such that some actions are deemed more appropriate in certain contexts based on an individual's class status and experiences. This then assists in determining what is valued and acceptable" (Gopaul, 2011:14).

Further, Bourdieu (1988) highlights the notion of academic habitus, which he applies to university teachers, and notes the reproduction of the university system which produces teachers possessing stable and homogeneous social and academic characteristics, and an academic habitus at every hierarchical level. It can be argued that Bourdieu's concept of academic habitus is equally relevant to PhD students, who are advised and guided, mainly, though not exclusively, through a one-to-one system of pedagogy. This helps them to develop new knowledge, independent thinking and reflective practices, leading to an academic habitus apposite to PhD students who will ultimately cascade this knowledge to wider groups and make an original contribution to their field of study for the benefit of future generations. Delamont et al. (1997) draw attention to the transmission of academic habitus in the natural sciences and contend that the enculturation of doctoral students is fundamental to intergenerational transfer of cultures within scientific disciplines through unique methods of social and intellectual organization. They note the strength of pedagogic continuity in the natural sciences through laboratory arrangements or research groups, which could be possible in humanities and in social sciences too, though in a different form. Their research on doctoral students indicates that pedagogic continuity is vital for understanding the intergenerational transfer of knowledge and the reproduction of academic habitus.

Methods

This article is based on a research project which sought to examine the perceptions of PhD students regarding their experiences at a post-1992 university in the UK (hereafter called the University). Traditionally, post-1992 universities, or "New" universities, differ from "Red-Brick" and/or "Russell Group" universities in certain ways. New universities attract more local students who live at home, part-time students who usually work fulltime while they study for a doctoral degree, and more home than international students. This is reflected in our research participants.

The main method of data collection was interviews, as "interviews are embedded in human experience and flagrantly draw on the participants' subjectivities. They seek the participants' perceptions of the social world as it is experienced and lived by them and those around them" (Basit, 2010:100). All PhD students in different schools within the four faculties at the University were approached and invited to participate in the research. Semi-structured interviews were carried out with the students: face-to-face or by Skype. A total of 23 PhD students were interviewed, including both male (10) and female (13); home (15), EU (2) and international (6) students; and those at different stages of their PhD, from across the University. The majority of them were part-time (18) students, with a few on the full-time (5) mode of study.

The following nine Schools from the University's four faculties participated in the study: Art and Design; Journalism, Humanities and Social Sciences; Business; Education; Law; Engineering; Sciences; Psychology, Sport and Exercise; and Nursing and Midwifery. For reasons of anonymity and confidentiality, each school has been identified by a letter. Further, students' names have been changed to pseudonyms. All participants have been given Western names so that international and minority ethnic students in different schools cannot be recognized. A number of issues were raised in the interviews and the data were analyzed by identifying themes related to these issues. These are discussed below under the headings of themes and sub-themes emanating from the data.

Teaching and learning

Getting acquainted with processes and procedures

Matos (2013) highlights the increased managerialism of the PhD process due to different funding priorities, which have changed the nature and objectives of doctoral study, though acknowledges improved PhD practices as a consequence of changes implemented by funding bodies. Changes include the annual monitoring reports of PhD students' progress. Mewburn et al. (2014) point to the confusion around the purpose and audience of these reports, which leads to inefficacious reporting by all parties, as countersigning requirements inhibit the frank reporting of progress, with reporting obligations going counter to institutional requirements. Nevertheless, most PhD students in the current study were satisfied with PhD processes and procedures:

My supervisor took me to different offices and to meet different people. Online enrolment was pretty easy. Transfer from [another university], where I had started with my supervisor and followed her here, was smooth as it was taken care of by my supervisor. Annual Progress Review is useful and very well organized.

Laura, School-S.

Despite such comments, some niggling issues were highlighted. It was queried why students were required to enroll every year (Adrian, School-R) and why they were not told at the beginning that they had to enroll annually (Dominic, School-X). Annual monitoring of students needed tightening (Emily, School-T), and some processes were slightly repetitive (Simon, School-S). Some procedures were a little confusing for distance learning students (Penelope, School-G), and there were too many papers to fill in (Melanie, School-S). One student reported a highly disappointing experience with regard to University policies and procedures:

There was a very lengthy delay between submission and viva. Examination team was changed several times by the Research Degrees Committee without clear rationale being given. Chairing of viva was poor, allowing external to dominate proceedings The University's bureaucratic processes in relation to PhD students, as governed by the Research Degrees Committee, are cumbersome and work to the disadvantage of the student.

Caroline, School-X.

Although this was an isolated comment, students, albeit rarely, had frustrating experiences of University procedures, when appropriate support was not provided expeditiously at specific stages. It appeared that the academic habitus of PhD students in the same university was not consistent across the university.

PhD supervision

Effective doctoral pedagogy is based on a mutually respectful relationship between student and supervisor, supported by a flexible learning structure, which enables modeling of scholarly practices, and opportunities for participation and reflection through scaffolding (Cotterall, 2011). Research in the US indicates that supervisory support leads to a strong sense of belonging and academic self-concept for both home and international doctoral students (Curtin et al., 2013). Students and supervisors have equally high expectations of the student-supervisor relationship which should be warm and supportive, and both groups should articulate their expectations clearly at the outset (Moxham et al., 2013).

Many supervisors expect written work from students in the first year, to present papers at conferences and publish a paper before or soon after the submission of thesis indicating a developmental relationship. Gruzdev et al. (2020) in their study on PhD students at Russian universities observe that students report the longest expected time to degree completion and the lowest level of satisfaction with supervisors whom they label "hands-off supervisors", as they provide no help to their students. On the other hand, students express the highest level of satisfaction and shortest expected time to PhD completion with supervisors whom they call "superheroes" and "mentors." However, Wisker and Robinson (2013) question the image of an enriching and developmental relationship between supervisor and doctoral student, and the latter's PhD experience as emotionally fulfilling and intellectually rewarding. Further, Cheng et al. (2016), in their qualitative study at two UK universities suggest that PhD students' satisfaction does not necessarily indicate quality education, since the degree of student satisfaction can be affected by students' expectations before commencing PhD study and their prior ideas about the value of a PhD.

The vast majority of students in the present study expressed their satisfaction with their supervisors, and saw them as outstanding (Dominic, School-X), excellent (Valerie, School-G), providing very good support and knowledge base (Timothy, School-G), who could not be faulted (Ralph, School-M) and who were there when needed (Sylvia, School-L). The quality of the supervision was viewed as timely, responsive, understanding, professional and with a clear common vision (Melanie,

School-S); and very good, very helpful, just what was needed (Olivia, School-R). The supervisors gave clear targets, with the freedom to explore; and the students never felt alone (Simon, School-S); they were proactive in asking students to do conference presentations and write for publication (Valerie, School-G). A full time EU student stated:

Can't complain; have never felt unsupported. I meet with supervisors once a week or once a fortnight. Also, a senior advisor spoke to me about methodology, for example, grounded theory, along with my supervisors.

Joyce, School-G.

And a part-time international student maintained:

My PhD is a credit to my supervisors. My principal supervisor was like my own mother. She gave me time, pep talk, and understood me. PhD is a long process. I might have left the program, but she kept me going. I had productive meetings with her and my second supervisor, face-to-face and by Skype, and regular contact by email.

Laura, School-S.

Such sentiments have been expressed in previous studies, too (see [Cree, 2012](#)). However, one student questioned the quality of supervision, which:

... would not bear close examination by any external agency interested in quality and standards. Second supervisor, who became principal, in name only after two years, never really understood what my thesis was trying to do and became invisible.

Caroline, School-X.

Such a disappointing experience of supervision was rare and was not reported by any other participant. Student satisfaction with their PhD experience is strongly related to the quality of supervision ([Harman, 2002](#)) and student expectations ([Cheng et al., 2016](#)). [Griffioen et al. \(2018\)](#) argue that differences in student ability may result in differences in student satisfaction, and educational stimulation and quality education can be conducive to students' educational fulfillment. This indicates that in ostensibly similar groups, each individual is likely to have his or her unique habitus ([Basit, 2012](#)). No two individual histories are alike, nor are two individual habitus identical, though there are classes of experiences and hence classes of habitus ([Bourdieu, 1993](#)).

As seen in the comment above, change of supervisors can be distressing for PhD students. This can also have ramifications for timely completion. Loss of supervisors through neglect or the supervisor transferring to another university can affect the student's confidence, ability and academic identity ([Wisker and Robinson, 2013](#)). Some students in the current study had problems with supervisors in the past but were happier with a new supervisory team (Abigail, School-Z). Others complained about the tardiness of feedback and felt the supervisors should step up (Emily, School-T).

Research highlights the kind of feedback wanted by doctoral students. This includes comments addressing their main idea, argumentation, clarity and information coverage, with written feedback comprising three aspects of function, focus, and presentation ([Can and Walker, 2014](#)). Also, there can be confusion about writing up as a separate or continuous endeavor, with many students waiting until after the completion of their research to start writing their thesis. Those encouraged to write continuously observe the merits of this approach, which would lead to timely completion ([Lindsay, 2015](#)). In their New Zealand study, [Wei et al. \(2019\)](#) highlight the liminality of the first writing submission and feedback interaction between doctoral students and their supervisors, involving a variety of emotions including anxiety, hope, awkwardness, excitement or dread. They caution that negative emotions can continue if the writing and feedback exchange is not managed carefully by supervisors. Evidently, writing is something that PhD supervisors at universities can advise their students to undertake early, and on a continuing basis, and provide timely, clear and detailed feedback on it to help students to progress in a confident manner.

Managing their own learning

For many students, the personally challenging nature of the PhD is central to the research process ([Owler, 2010](#)). While this may have implications for the wellbeing of the students, [Cotterall \(2011\)](#) argues that students ought to develop an understanding of the demanding nature of a PhD so that they can manage their own learning. Many students in the current study indicated that they could successfully manage their own learning since:

A PhD is, by its very nature, an exercise in demonstrating the ability to research. This means that the students must be able to manage their own learning. Students who have difficulty in this respect may also find it difficult to be independent researchers, and this can only be tested by doing it.

Callum, School-H.

Across the University, students were motivated by their supervisors to be creative and manage their own learning (Nicola, School-R); they felt empowered and encouraged (Joyce, School-G) by the expert guidance of their supervisors who, through active discussions, made them reflect critically and creatively on their work to develop their own learning (Melanie, School-S). This is contrary to research on doctoral students in Sweden (Brodin, 2018) which shows that their scholarly creativity is stifled, leading to a silence emanating from traditionally restrictive intellectual, political and economic institutional agendas.

Nevertheless, managing their own learning could be more difficult for those with fulltime careers, such as the University's own staff members; since as a PhD student and an academic staff member, you had to balance your PhD with your day job (Simon, School-S). Some felt that managing their own learning was an individual skill, which depended on the personality, motivation and creativity of the student (Dominic, School-X). An International student noted:

I had come from a system where you read and reproduce. My supervisors told me what was expected from a PhD student. Now at the end of my PhD, I can do research on my own. PhD has given me this confidence and I am now self-efficacious.

Laura, School-S.

Such confidence in their own abilities is significant, exemplifying an academic habitus, which can then lead to the students applying their knowledge to bring about positive changes in their occupational milieu. International doctoral students in the US highly value research and academic experiences, and despite encountering problems related to enculturation, a higher percentage complete its doctorates earlier than home students (Curtin et al., 2013). The reason for this may be because they want to gain competencies that can enable them to bring about change and improvement in higher education in their own country. Research (Rhoads et al., 2017) shows how Chinese doctoral students develop their methodological knowledge and skills with the aim to generate insights which would be potentially helpful to higher education reform in their home country, leading to the creation of world class research universities in China.

It was suggested that controls should be placed on students to manage their own learning and deliver on time as there was no support on this (Emily, School-T). Conversely, others were expected to manage their own learning almost entirely, which they found problematic (Abigail, School-Z). This illustrates that the academic habitus possessed by the students varied between disciplines and supervisors. While many students were taught to manage their own learning and were successfully able to do so, some others needed appropriate scaffolding to enable them to gradually become independent and creative learners. Literature shows that some students possess considerable academic habitus and are able to undertake doctoral studies without difficulty (Gopaul, 2011). This indicates that universities need to identify students who require additional support and provide it in a timely and appropriate manner.

Peer relationships

Socialization

Research on doctoral students in the departments of chemistry and history at two US universities (Gardner, 2007) highlights the importance of socialization in these students' success. Different kinds of information exchange between doctoral students: basic, administrative, professional, social and personal has been noted by Lee et al. (2017). Only a few students in our study mentioned opportunities for socializing, which included students within specific schools interacting with one another (Nicola, School-R); friendships forming among students within the school (Sylvia, School-L) and those supervised by the same supervisor (Olivia, School-R). In one school, students met once a week and one of them presented from their research (Ralph, School-M). Events such as the joint annual conference with another university were also seen as an opportunity for socializing with peers (Nicola, School-R). However, some students from different schools reported that they refrained from socializing with their peers because of lack of time (Emily, School-T; Joyce, School-G) or lack of inclination (Valerie, School-G; Adrian, School-R; Caroline, School-X), since the majority of students had full time jobs.

One faculty had arranged a successful welcome buffet for all new and current PhD students the year before, which was attended by supervisors as well as students, and hoped to make it an annual event. Another organized semi-social events where the staff got together with the students within the postgraduate research center for "a nibble and chat". Students were also able to socialize when PhD students in a faculty or school shared the same office or laboratory and thus a quasi-research-community gradually developed. Some students felt isolated as they were aware of social events at other faculties (Abigail, School-Z); and thought it would be nice to have occasional interaction with peers and discuss work (Timothy, School-G). Tactics used by doctoral students to combat loneliness and isolation include student-supervisor relationship; working spaces; social interaction with peers; networking at seminars, conferences and workshops; and online fora to provide emotional support to students (Janta et al. 2014). Those who wanted social interaction with their peers felt lonely and mentioned the lack of opportunities for socializing:

I have joined groups online, but no face-to-face interaction Need something like a Graduate School, as in other universities! A sense of belonging is needed.

Abigail, School-Z.

Support from peers

It has been argued that peer learning, located within the concept of communities of practice, could be an appropriate lens to view research degree education (Boud and Lee, 2005), and students view peer mentoring as a developmental role of peer relationships (Lee et al., 2017). There was a feeling among participants in the current study that PhD students in the University lacked a sense of community. The need for more peer support was emphasized (Nicola, School-R). While an online community was encouraged, it did not happen (Dominic, School-X). Minimal peer support, such as feedback at presentations, was reported by the students, though some had different strengths which enabled them to support each other (Ralph, School-M); and sharing a working space helped (Sylvia, School-L; Joyce, School-G); others received no support whatsoever from peers (Emily, School-T; Nicola, School-R). International and EU students had negligible peer support and chances to socialize with other PhD students; they did not seem to be aware of online fora, and suggested a website/portal or Facebook page for alumni and current students to interact with one another (Laura, School-S). Also:

Online seminars where a group of international students meet via video conference to present and discuss what they are working on under the supervision of an academic expert from the University. The seminars could take up a particular focus such as methodology or literature review and the international students could meet up online to present and discuss their work

Melanie, School-S.

Some received information from students who were ahead of them in their PhD study (Olivia, School-R), and it was felt that PhD students at an advanced stage of their research should act as peer-mentors to new students (Sylvia, School-L). This was already happening in some schools in the University, indicating the added value and transferability of the academic habitus of older students conveyed to newer students. This is something that other faculties can emulate by creating opportunities for PhD graduates and current PhD students to meet personally or virtually.

Employment prospects

Graduate attributes

Bryan and Guccione (2018), in their study of UK doctoral graduates, identify four areas of doctoral value, shaped by aspects during and after their doctorates. These include time since graduation; supervision; accumulated social connectivity; and value of the doctorate to the employer. On the basis of their national survey in France, Durette et al. (2016) built a framework of 111 competencies, leading to a set of "core" competencies found in doctoral graduates, regardless of discipline or date of graduation. The authors contend that PhDs develop a set of common competencies, which is not limited to knowledge and technical skills, but includes transferable competencies. These comprise competencies learned through practical experience, as well as courses, and include dispositions, behaviors and meta-competencies, giving PhD graduates the ability to adapt their competencies to different professional contexts. These competencies are also identified as "graduate attributes" in the literature.

Generic qualities acquired along with disciplinary knowledge in higher education, such as critical thinking, scholarship, initiative, team working and so forth, and jointly labeled as graduate attributes, are viewed as the *raison d'être* for higher education (Platow, 2012). PhD graduates report the acquisition of many graduate attributes before commencing their PhD, through education, debate, work experience, personal characteristics and ability, family training and responsibilities, socializing and so forth. They develop further graduate attributes during their PhD, such as in-depth knowledge of the field of study, analytical skills, critical judgment, and so on, because of supervision, interaction with and observation of peers and academics, feedback, conferences and workshops, and writing for publication (Manathunga et al., 2009).

The students in the current study acknowledged that they had developed a range of attributes during their PhD study. This included more confidence (Laura, School-S); sharper research skills and improved ability as a researcher (Dominic, School-X; Emily, School-T); analytical skills (Lee, School-T); meeting deadlines (Neville, School-T; Hazel, School-T); time management, project management, ability to take feedback (Nicola, School-R); personal and communication skills (Timothy, School-G), and how to write (Ralph, School-M). It taught them skills that led to knowledge enhancement (Adrian, School-R), organizing conferences and events, and teaching, and self-managed mentoring (Sylvia, School-L). In short, PhD was a life enhancing activity (Caroline, School-X). It is noteworthy that the final comment was from a student who had reported some negative experiences of supervision and examination, as noted above, yet, in essence, benefited from her PhD study and found it to be a productive and enriching experience.

Career opportunities

PhD competencies or graduate attributes constitute a common vocabulary between doctorate holders and employers; are regarded as a valuable tool for PhDs to impress recruiters; and highlight the suitability of doctoral training to meet the needs of the labor market (Durette et al., 2016). Adkins (2009) observes that PhD study involves the translation of knowledge to domains outside the university where it can be taken up and applied. Students in the current project believed that studying for a PhD had enhanced

their career prospects and chances of career progression, as they had gained additional employability skills (Jason, School-T), and the ability to communicate effectively with outside agencies (Callum, School-H). In particular, it had improved their critical thinking competence and in-depth research skills to prepare them for a career (Valerie, School-G; Joyce, School-G). Walker and Yoon (2017) contend that specific academic practices, attributes and behaviors, both existing and acquired, jointly form, what they regard as, doctoral capital that can lead to graduates successfully acquiring academic posts after the completion of their doctorates.

Literature shows that a high proportion of students favor university-industry links, and those funded by industry express a higher level of satisfaction for their PhD program, believing that industry funding could improve their career prospects (Harman, 2002). Some students in the current study already had links with industry, and some were jointly sponsored by the University and an external establishment:

I am a full time EU student ... The University pays half my fees and [an external organization] pays the rest. I get living expenses paid by the University. I work on two research projects which are linked to my PhD. I do up to six hours of teaching per week.

Joyce, School-G.

Such University-industry links were undoubtedly beneficial for the student, University and the industry partner. Some other faculties at the University had also forged links with industries connected to their discipline, thus enabling the students to extend their academic habitus to the wider social and employment contexts. Yet, Manathunga et al. (2009) note that while the majority of students in their study agree that skills developed during the PhD prepare them for the world of work, less than half believe that links with industry will improve their career options. These authors note the diverse fields that PhD graduates get employment in and highlight the need for the corresponding diversity of skills needed for these roles. This shows that stronger links between universities and a variety of employers can be of benefit to organizations, students and employees.

Conclusion

Reay (2004) supports the use of habitus as a conceptual tool to ensure that the research focus is wider than the specific issue under study. Listening to student voices on a range of issues is crucial to improve the curriculum, pedagogy and support mechanisms. An appreciation of the viewpoints and experiences of recent doctoral graduates is important in order to design and evaluate PhD programs more effectively on a regular basis (Manathunga et al., 2009). We argue that it is equally important to consider the perceptions of current PhD students, so that they, too, can benefit from any changes to policies and practices which result from the articulation of their insights about their doctoral program and develop their academic habitus at the same time.

Bryan and Guccione (2018) categorize four areas of doctoral value as time since graduation, supervision, social connectivity, and value to the employer. The vast majority of students in our study are highly satisfied with their supervision, with isolated cases of dissatisfaction, due to tardy feedback, or other issues, most of which were resolved by changing supervisory teams. Faculty Directors of the PhD Program and Chairs of Research Degree Committees should identify these isolated cases during the evaluation of PhD programs and act swiftly in case of problems between students and supervisors, among examination panels, or to address other issues raised by the students. Exercising transparency is crucial in such instances so that the student is fully cognizant with the reasons if a supervisor or examiner is suddenly changed due to unavoidable circumstances. A new supervisor or examiner should be au fait with the student's work before assuming the role so that the student is not disadvantaged. Feedback should be timely and helpful, to enable the student to move forward.

Starting to write early on is beneficial for doctoral students as it gives them the opportunity to critique previous research in the field and gives them confidence to begin to write at PhD level. It also leads to timely completion (Lindsay, 2015). Students acquire a range of graduate attributes, including writing at doctoral level, during their PhD, which are linked to their academic habitus. Yet, the possibility of gaining various attributes in different faculties and schools can be dissimilar. There should be opportunities for faculties to share best practice through a University-wide hub, such as a Graduate School, which is currently lacking at the University.

PhD students, in the main, can manage their own learning, though some of those studying part-time and working full-time can find it difficult. This is particularly problematic for University staff undertaking PhDs, as well as other students who have demanding jobs, when they are given a new responsibility or get promoted, leading to more time spent on work-related issues, with the PhD taking a lower priority. Such students need a combination of clear guidance and scaffolding, with well-defined short-term targets to fulfill bigger objectives to enable them to manage their own learning. In congruence with what has been reported in the literature (Castello et al., 2017), a number of mechanisms are in place at the University to ensure standards and timely completion of PhD to help students achieve a balance between personal, professional and academic life.

Completion of procedures can take a long time resulting in student frustration. Some students question the nature of policies and the duration of procedures, with some instances of extreme dissatisfaction and frustration. Progress reporting should be linked to substantive reviews of progress and embedded in the pedagogy and curriculum of doctoral programs (Mewburn et al., 2014). Completion of forms by students at various stages of the PhD should be signed off and evaluated swiftly by supervisors and

evaluators at the University. University processes and procedures need to be made simpler and students encountering problems with supervisors or examiners should receive prompt support. Students are largely satisfied with the resources and other academic support, though there is room for improvement, as there is lack of uniformity in provision of resources across faculties. Faculties can learn from the good practice of one another. More resources need to be made available to students as required, and academic support, other than supervision, can be improved in line with student expectations to enhance their academic habitus.

In our knowledge society and economy, doctoral education is increasingly considered as a means to produce workforce to meet the needs of the global labor market (Durette et al., 2016). The academic habitus of PhD students in our study, mainly developed through a combination of supervisory support and the acquisition of graduate attributes will enable them to succeed in the employment market. There is a clear and positive relationship between graduate attributes and productivity on PhD completion, emphasizing the value of these attributes and the role of the university milieu in providing attributes needed for employment (Platow, 2012).

Individuals undertake PhD study for both professional and personal development. Knowledge acquired during PhD study can be transmitted to realms outside the university (Adkins, 2009). The academic habitus acquired during their PhD program has enabled our research participants to develop not just as people and professionals, but they have also gained the ability and confidence to be catalysts of change not only in their own organizations, but also in their respective countries. Research on Chinese doctoral students (Rhoads et al., 2017) suggests these students develop knowledge and skills with the objective of facilitating higher education reform in their home country. The part-time, as well as fulltime, students in our research clearly have the potential to make a valuable contribution to the knowledge economy, if they are not already doing that, as most of them are in employment. This is due to their existing and acquired skills and attributes. According to Walker and Yoon (2017) these skills and attributes jointly constitute what they consider as doctoral capital. We believe this doctoral capital is the product of these students' academic habitus.

Literature (Gardner, 2007) emphasizes the significance of socialization in the success of doctoral students. Our study illustrates that the students have developed individual and collective habitus based on the academic, social and wider support in the University as well as their personal attributes. Yet, the academic habitus possessed by students varies between disciplines and supervisors and is not consistent across the university. Our research also highlights the added value and transferability of the academic habitus of older students transmitted to newer students, pointing to generational gain. Further, faculties who have forged links with industries related to their discipline have enabled their students to extend their academic habitus to wider social and employment contexts.

Delamont et al. (1997) argue that students' doctorates are required to extend the traditions of their discipline. Intellectual continuity is thus accomplished through one-to-one associations, with students supervised with continuity in the same tradition by the same supervisors. This tradition illustrates a specific academic habitus developed through such intellectual relationships and internalized by the students. A similar academic habitus is epitomized by PhD students in our study. All our students are either progressing well, are close to completion, or have recently submitted. These students exemplify a specific academic habitus, which can only be found in highly intellectual and successful individuals who have the potential to improve not only their own professional and personal lives, but also to make a significant intellectual contribution to societal good.

Introduction

Governments have for some time been extolling the virtues of “seamless” education systems. They perceive them as key organisms in their efforts to maximize learning opportunities within their twin agendas of skill development and social equity, and so there is keen interest in arrangements that either facilitate or hinder transfer between educational sectors and from these sectors into employment. Attainment of the reality, however, has proved more elusive than the rhetoric. Many studies have recognized that there are challenges, as “effective transitions and articulation with other sectors of education and training are often elusive” (OECD, 2014, p. 33). Young (2006, p. 5) even raises the question of whether “seamlessness is at the heart anti-educational because it fails to take account of the specificities of different types of learning and knowledge”. Others allude to the power-plays that can occur in moves to draw together more closely, for example, the academic and vocational or the secondary and tertiary sectors, as the culture of the respective academic and higher education (HE) sectors invariably predominates. Moreover, as Bathmaker (2017, p. 4) states, hybrid or “dual” routes at higher levels, while proving increasingly desirable to high achievers, tend to become colonized by those from advantaged backgrounds, squeezing out the disadvantaged and underserved. Yet attempts to blend “the worlds of education and of work via continued reform of vocational education and training (VET) systems has become a key priority of European Union policies, especially in the aftermath of the 2008 global crisis” (Pouliakas and Ranieri, 2018, p. 491) and more recently the Covid-19 pandemic which has presented unprecedented challenges to national VET systems (GOVET, 2022; OECD, 2021).

Prevalent in political discourse is the notion of educational pathways. Over the years, there have been common themes in policy documents and other literature concerned with people's transitions through their life and career course—the need for ease of movement and for pathways and cross-sectoral collaboration, as well as for career guidance to assist transition (Céreq International Mission, 2020; CareersNet, 2020; Cedefop, 2017; OECD, 2014, 2000). The OECD (2020) selected VET as its theme for its *Education at a glance 2020* because of the “renewed interest in VET in recent years as an effective means to open pathways for further learning and personal growth, and ease the transition of learners into the labor market” (p. 15). A popular approach has been the construction of national qualification frameworks, designed to take account of a range of academic and vocational credentials that would cater for individual learner needs and be credible and understood generally. Opening pathways in this way implies take-up of recognition of prior learning (RPL) and credit transfer as well as removal of “time-served” aspects in qualifications. Another policy response has been the deregulation of tertiary education. This has involved stimulation of a market model, where private providers proliferate and public educational institutions are encouraged to amalgamate and/or re-invent themselves. Nevertheless, such a commodification of education has its limitations, especially when barriers to market entry are set too low and not adequately

regulated and monitored (Toner, 2014, 2018). Yet competition has become a key ingredient in this educational maelstrom, with the anticipation of institutional responsiveness and learner choice. Other measures have included more flexible modes of study, such as part-time and modular arrangements, distance and blended learning, and competence-based approaches, to enable pathways to be more flexible and cater more adequately for needs of learners.

The OECD (2000, p. 13) identified six key elements of successful transition systems: a healthy economy; well-organized pathways that connect initial education with work and further study; opportunities to combine workplace experience with education; safety nets for those at risk; sound information and guidance; and effective institutions and processes. These ingredients represent a helpful litmus test for reflecting on situations in different countries, and the degree to which educational systems facilitate these criteria. Any discussion, therefore, involving pathways must inevitably also consider context—the nature of educational systems, particularly skills formation, in which they are embedded and of labor markets with which they are intricately linked.

In this chapter, the first section draws on the international literature to examine the main issues and debates in the areas of pathways and their twin contexts of labor markets and skill formation (education) systems. There exists a vast quantum of literature on pathways, and here only the most recent research is reviewed in order to furnish the most up-to-date portrayal. The second section then focuses on the Australian situation as its case study to illustrate types of pathways, how they operate in practice and related issues that impact upon them, as Australia can provide an informative and balancing case. For not only has the bulk of literature come from European perspectives (Caves et al., 2021), it has also focused on school-based VET systems and been preoccupied with young people's entrances into labor markets (Hanushek et al., 2017; Hodkinson and Bloomer, 2002). In contrast, the Australian skills system is largely post-secondary (though some lower level VET occurs in schools¹) and focused more on whole of life and careers. As post-secondary vocational education has been characterized by the OECD (2014) as a "hidden world" (p. 11) and "inadequately understood" (p. 22), focusing on pathways in Australia is worthy of examination.

Labor markets and skill formation systems

Pathways need to be considered within their context. However, the issue here is that in the literature there are various typologies of labor markets and skill formation systems depending upon what criteria are employed. At the broadest level, they are often distinguished as either liberal market economies (LMEs), such as the United States, United Kingdom, Canada and Australia, or coordinated market economies (CMEs), such as Germany, Austria and Switzerland (Fortwengel et al., 2019; Vossiek, 2018). In the view of Fortwengel et al. (2019), the key differentiating feature is the extent to which they experience difficulty in sustaining institutions which support apprenticeship training systems; companies in LMEs rely largely on recruiting skilled workers from external labor markets and/or training recruits in firm-specific skills on-the-job, while those in CMEs rely more on apprenticeships to recruit and train their workforce. Early work distinguished between high-skill and low-skill systems (Finegold and Soskice, 1988), and various writers appropriated different criteria for classifying systems, such as the role of the state in skill provision (Greiner, 1993), the predominant venue for training – institutions or workplaces (Lynch, 1994) or the specificity of skills provided (Hall and Soskice, 2001).

More recently, Bussemeyer and Trambusch (2012, pp. 11–12) identified four different skill formation systems: liberal (US, Ireland), segmentalist (Japan), statist (France, Sweden) and collective (Germany, Netherlands, Denmark, Austria, Switzerland). For these authors, the issue was the varying degrees of company and state involvement in training. A further refinement by Pilz (2016, 2017) adopted a multi-perspective approach, expanding on previous attempts by, firstly, combining skill formation, stratification and standardization approaches, and secondly, incorporating the micro-level criterion of the practice of learning. It thus attempts to add to the debate by countering the criticism made of typologies that criteria are restricted and often incoherent. Pilz's typology analyses the first seven countries in Table 1 and we have added others. Of particular relevance to this chapter and further discussed later, the Australian skill formation system is claimed to be industry-led, though in reality it is heavily government controlled and regulated, largely takes place in post-secondary institutes and independent providers (and at a lower level in secondary schools separated from general education subjects), is standardized by the Australian Qualifications Framework and Training Packages, and its teaching and learning is closely linked to vocational practice via competency-based training and assessments in workplaces.

From analyses such as these, one notes that the debate centers on the degree of "fit" between the educational system and the labor market—it is far tighter in CMEs than in LMEs. This holds significant implications for pathways, not only when individuals enter employment but through their careers. Where there is closer coupling between education and labor market, tertiary education more clearly regulates individuals' access to particular occupations. Where there is looser connection, this relationship is characterized by more intensive competition, lower employment tenure and market rules. In such contexts, there is greater potential for displacement between levels of education and occupational position, and individuals are likely to perceive a potential mismatch between their qualifications and returns in the job market (Tomlinson, 2012), discussed later in the chapter in the case of Australia. As Roberts (2020, p. 27) comments, governments in LMEs cannot impose transition regimes in total and in detail, and thus the types of education that governments will fund, including training provisions together with employment regulations, "set the context

¹The recent Australian review by the Education Council, *Looking to the future* (2020), concluded that "VET delivered to senior secondary students is of inconsistent quality, difficult to navigate, and not well integrated into senior secondary studies" (p. 76). It recommended that: "VET should only be provided at school where it can be done in a high-quality way as demonstrated through the explicit endorsement of local employers or industry bodies ..." (p. 21).

Table 1 Typology of VET systems.

<i>Countries</i>	<i>Skill formation</i>	<i>Stratification</i>	<i>Standardization</i>	<i>Practice of learning</i>
USA	Individualized	Low	Low	High
France	State	High	High	Low
Germany	State/company	High	High	High
Japan	Company	High	High	High
India	Individualized	High	Low	High
China	State	High	High	Low
Mexico	Individualized	High	Low	High
Australia	State/company	Low	High	High
Singapore	State	High	High	Low
UK	Individualized	Low	Low	High
Canada	Individualized	Low	Low	High

*Skill formation: the influence of the state on VET and the potential for activity by and influence of companies. *Stratification: issues of “tracking” and the separation of general training courses and vocational courses. *Standardization: how structures and processes underpinning VET are standardized and subject to regulation. *Practice of learning: relevance of teaching and learning processes to vocational practice or later roles in employment.

Adapted from Pilz (2016, 2017).

in which educational actors, employers, training providers and young people pursue their own agendas”. In LMEs links between qualifications and occupations are quite weak with the result that skills gaps and skills mismatches can exist (Hughes and Smith, 2020; Puckett et al., 2020; Karmel et al., 2008). The key issue is the relationship between educational systems and the labor market. It is often assumed that education is crucial for meeting the challenges concerning the future of work. But in the view of Wheelahan and Moodie (2017), variations in the role of vocational education in preparing graduates for employment and educational pathways mostly lie not in the nature of vocational education nor its qualifications, but more in the labor market structure and how employers use qualifications to select graduates and progress in employment.

In this respect, debate continues over the development of micro-credentials and short courses. Europe (Lantero et al., 2021), Canada (Colleges and Institutes Canada, 2021), Australia (Australian Government, 2021) and New Zealand (NZQA, 2022) are currently considering their value. They are seen as helpful for industry and the economy to recover from the Covid pandemic and respond to the needs of the digital age, with the increasing need for upskilling and reskilling the labor force, and the emphasis on student-centered learning and flexible learning paths. They can provide training that is accessible to vulnerable groups who have been under-represented in education, and their flexibility allows learners to track their own pathways; for example, arranging schedules to take into consideration childcare or eldercare as well as their work—such flexibility can be particularly advantageous for women learners. However, in a background paper commissioned by UNESCO, Buchanan et al. (2020) contends that focusing on reforms like micro-credentials and 21st century skills to achieve employment growth is actually a distraction from what successful education systems can achieve. In his view, education cannot make up for inadequacies in other policy domains that have caused and continue to cause declining job quality as well as mass unemployment and under-employment. His plea is for education to be brought back into the debate as important *per se*, rather than as an auxiliary policy aimed at fixing flaws of other policy domains.

Examining tertiary education pathways

Review of the literature reflects that much policy attention has focused on institutional architecture for facilitating movement, while there has been far less consideration of learners’ experiences in their educational journeys and how they make meaning of their transitions. Both structure and agency need to be considered for meaningful understanding of youth transitions (Roberts, 2020; Schoon and Lyons-Amos, 2017).

Interrogated from this perspective, such policy promotion is debatable in that it may be perceived as both positive and problematic. On one hand, increasing “seamlessness” and facilitating pathways can provide considerable choice for learners as they wrestle with challenges of learning and work. On the other, they can lead to a climate of uncertainty and indecision, where learners struggle to make meaning of the plethora of possibilities, grapple with decisions over appropriate ways ahead and discover later that less than optimal selections can be both financially draining and time inefficient. Policy that promotes unlimited choice has tremendous potential, yet necessarily makes assumptions about (a) individuals having the requisite “personal capital” (agency) to take advantage of alternatives, (b) the usefulness and timeliness of career information and services, and (c) the availability and

accessibility of courses and providers especially in rural locations and socio-economically disadvantaged areas. Making choices is thus viewed as an unproblematic process where students can engage freely and actively. This view emerges from the stable of rational choice theory, whereas prospect theory, on the other hand, can offer a more realistic alternative by recognizing that individuals' capacity for rationality is limited (Brown, 2017). Furthermore, such policy promotion may also be under-estimating the subtle though powerful influence of sectoral and institutional cultures, and their power relations that can work against smooth transitioning of learners (Bathmaker and Thomas, 2009) as well as inducements that may be offered to make particular choices (Toner, 2014). As Crump (2007) argued, "there is very little evidence-based research on choice and flexibility in further and higher education compared to a wealth of research about school choice", mainly because the option of choice beyond schooling has been "seen (falsely) as self-evident" (p. 4). Educational pathways of learners, therefore, are perhaps not and cannot be as clear or seamless as policy might desire.

Moreover, the very concept of pathway can be contentious as it reflects a policymaking perspective, focusing on structural considerations that are directly under the control of policy makers. It therefore needs to be balanced with the complementary concepts of "navigations", emphasizing more the perspectives of individuals as they strive to manage their own itineraries, and "trajectories", highlighting the social forces that shape transitions and that individuals making transitions vary in their resources (Evans and Furlong, 1997). While Raffe (2003) argues that pathway can be a useful organizing concept, he does conclude that official maps of pathways must (a) correspond to the ways in which they are actually experienced, (b) allow for different types of transitions, being flexibly designed to accommodate an array of events through life that affect transitions in and out of work and education, and (c) incorporate clear signposts for individuals learning how to navigate them.

Typologies of educational pathways

There have been a considerable number of studies researching educational pathways and "transition trajectories" (Keskiner, 2019, p. 107) in recent international literature—only a few examples can be mentioned here. Some have focused on movements between educational sectors, others on transitions from education into the labor market and still others on pathways through the lifespan.

Pathways between educational sectors

Harris and Rainey (2012) identified five pathways in Australia's tertiary education system in their study of two-way movement of students between the HE and VET sectors. These were: erratic pathway (pursued by interest-chasers); flowing pathway (developers); merging pathway (combiners); tangential pathway (forced learners); and parallel pathway (two trackers). Studying the post-compulsory educational pathways of young people in England who had spent some or all of their childhoods in local authority care, Cameron (2018) singled out six pathways, named as: Traditional A levelers, Alternative traditional, Ordinary young lives, Futures on hold, Home-based locals and Building a life. Only the first two were secure in their orientation to their own futures. For the others, structural factors such as access to citizenship or the right to work, or employment, or familial or individual factors such as health and caring commitments, acted as barriers to their ambitions.

Pathways from education into the labor market

By far the most studies focus on this transition. Recent research (Ranasinghe et al., 2019) on school-to-work transitions of Australian youth identified five pathways: HE and work; early entry to full-time work; mix of HE and VET; mixed and repeatedly disengaged; and mostly working part-time. These are similar to those of Roberts (2020, pp. 37–38) who identified that there were five main transition routes in the UK: university into elite careers; university into the lower middle class; exit education at 18 and enter the lower middle class, possibly via an apprenticeship; exit education at 18 and enter the upper working class, possibly via an apprenticeship; fail in education and join the precariat. Also in the UK, Schoon and Lyons-Amos (2017), drawing on data from the Longitudinal Study of Young People, identified six distinct pathways: an academic track, three pathways involving further education and training, a work-focused transition group and a group who over a long period were not in education or training. In Germany, Brzinsky-Fay and Solga (2016) studied school-to-work-transition patterns for five birth cohorts. While they found that traditional pathways (general education-tertiary education-into employment) increased over the cohorts, so too did non-linear pathways (status shifts, and some non-employment experience).

Pathways through the lifespan

Fry and Boulton (2013), drawing on *Household, Income and Labor Dynamics in Australia* (HILDA) survey data in Australia, identified 17 pathways through a lifespan. Different pathways can arise with key life events—for those aged 15–24 (five pathways), aged 25–39 (four pathways), aged 40–54 (four pathways) and aged 55–64 (four pathways).

There are a number of ongoing debates on pathway typologies. They may be clustered into two broad categories: the nature of pathways and the factors that influence them. In the first category, the nature of pathways, are embedded questions about whether patterns are linear (traditional) or divergent (alternative), and what they actually look like (e.g., Keskiner, 2019). The traditional

pattern is generally depicted as a smooth trajectory that follows institutionally predictable, linear pathways, while the divergent path is where learners experience periods of study in different sectors, unemployment, shift between different employment statuses or change direction. Inherent in this debate is the role of agency versus structure—whether shifting transitions are initiated by learners' desires to experience alternative pathways or by environmental conditions forcing them into precarious situations. Schoon and Lyons-Amos (2017) contend that study of structural constraints and agent roles are both essential.

In the second category are factors that affect pathways. Some researchers cite studying VET subjects at school, individual school achievement and socio-economic issues as key influences (e.g., Ranasinghe et al., 2019). Others report the substantive influences of parents and friends on the educational expectations of secondary school learners (Roth, 2017), although Billett et al. (2020) report that while parents and school-teachers may under-estimate their influence on learners' decision-making, their advice is primarily based on their own experiences, rather than more broadly informed and more impartial considerations. In this regard, tracking is an important issue that is often researched. In what Bol and van de Werfhorst (2013) call "a trade-off between equality and labor market preparation", they acknowledge that systems with a high level of tracking and vocational focus have been shown to improve the allocation of school-leavers in the labor market, but also to increase inequality of educational opportunity. Related to this debate is the relative value of vocational vis-à-vis general qualifications in transitions. Many researchers have found that vocational qualifications can help more than general qualifications in gaining more rapid entry into the labor market, but are soon overtaken by their counterparts with a general education (OECD, 2020; Middeldorp et al., 2019; Roosmaa et al., 2019), mainly due to occupation-specific skills making them less flexible. Hanushek et al. (2017) refer to this as another "trade-off", for which they found strong and robust support in analyzing data from 11 countries, where gains in youth employment can be offset by less adaptability and diminished employment later in life. Thus, potential short-term advantages of vocational qualifications are likely to be offset by disadvantages in later life, what Forster et al. (2016) label "the life-cycle effect" (p. 474) and found to be independent of the strength of the vocational system.

The evidence indicates that transitions are "problematic and protracted" (Alam and de Diego, 2019) and that youth integration into the labor market differs considerably across countries (e.g., Ryan, 2001; Wolbers, 2007). Based on their analysis of international practice from 105 reports, Hughes and Smith (2020, pp. 32–43) identified seven key guiding principles which policymakers should use when shaping policy and practice: start early; support teaching and learning; embed careers firmly in the curriculum and school-to-work transitions; encourage effective career and transition dialog; engage employers; utilize technology and labor market information, and importantly, make use of evidence to strengthen skills and create new pathways.

From this complexity at least three common and important threads may be discerned in the literature. One is the prevalence of non-linear pathways, even in highly stratified systems as in Germany (Roth, 2017; Brzinsky-Fay and Solga, 2016). Harris and Rainey (2012) characterized this non-linearity as crazy paving rather than orderly stepping-stones. Whether or not these non-linear pathways are inefficient, especially in national systems where links between education and labor market are loose, is debatable. Certainly, politicians are fond of expressing such sentiments (see examples in Vaughan, 2005; Karp, 2020). Many studies have drawn attention to the phenomenon of indirect transfer where movement of tertiary students involves several moves within and between institutions, sectors and workplaces. This phenomenon has been variously described as "milling" (OECD, 2000, p. 76), "churning" (Fry and Boulton, 2013, p. 18), "swirling" (de los Santos and Sutton, 2012, p. 967), "the community college shuffle" (Maxwell et al., 2002, p. 1) and, most recently, "meandering" (Roberts, 2020, p. 37). Considerable research in various countries including Australia (Harris and Rainey, 2009, 2012), the UK (Tomlinson, 2012) and Singapore (Harris and Ramos, 2012, 2013) has demonstrated high levels of learner movement between sectors, highlighting the complexity in the phenomenon of pathways both within and between tertiary education and employment. Research has also shown that patterns in learner movement vary markedly by sector and education field and that these variations can be explained by labor market and regulatory structures in occupations (Fredman, 2013). Yet many policy settings assume pathways occur between the same fields and that the internal mechanics of tertiary education alone can be adjusted to improve transfers. As Tomlinson (2012, p. 419) concludes:

The themes of risk and individualization map strongly onto the transition from [tertiary] education to the labor market ... The transition ... is perceived to be a potentially hazardous one that needs to be negotiated with more astute planning, preparation and foresight.

A second thread is the importance of individual wherewithal, or personal capital, so critical as to whether pathway opportunities are taken up and pursued. Navigating one's career usually involves moving between familiar and unfamiliar environments, often referred to as boundary-crossing. Such transitions, as argued through this chapter, can be complex. In the career navigation process, a key issue is where the locus of control lies – externally or internally? Global forces make for "boundaryless careers" (Arthur, 2014), characterized by uncertainty and flexibility, where individuals search for meaning in their continuously changing career trajectories. While the boundaryless career concept highlights the shifting nature of job markets external to the individual, the concept of "protean career" (Gubler et al., 2014) focuses more on the internal aspects where individuals strive to take charge of their careers and make sense of their environment without external guidance. A recent study in Australia, summarizing the 10-year transition pathways of 3186 individuals aged between 16 and 25, demonstrated that "young people's post-school pathways are diverse, individualized and complex, underscoring the importance of understanding youth transitions as a process" (Ranasinghe et al., 2019, p. 9). This suggests that learners with fewer personal resources and lower competence may be unlikely to be able to adjust satisfactorily. As Solomon (2005, p. 105) concluded:

... while boundary crossing between working and learning may be desirable in policy and rhetorical terms, it is neither uncomplicated nor unproblematic. Yet the conflation of work and learning is discussed as if it were natural and transparent. ... we can't ignore the complexities the conflation ... produces, nor ignore that fact that these complexities comprise intricate identity issues.

While pathways between education and training sectors may have improved over time, debates remain over the extent to which barriers still exist, such as funding, inadequate credit recognition and transfer arrangements, and administrative issues. Studies frequently focus on such matters as articulation and curriculum issues between institutions, blurring sectoral boundaries and differences in accreditation arrangements. It is unlikely, however, that the solution is as simple as resolving credit transfer and administrative processes. The reverse side of the coin is the extent to which individuals have the choice of exercising control over their own itineraries, or are influenced by the status of particular pathways; for example, school to higher education being privileged over school to vocational education studies and apprenticeships. Considerable research illustrates that such pathways tend to be erratic rather than linear or predictable, and rarely the products of rationally determined choice, as they are inextricably linked with other life experiences and personal circumstances. Our principal argument here is that the importance of personal agency in transitioning, what [Heinz \(2009, p. 391\)](#) calls “planful and adaptive competence”, has been under-emphasized given the preoccupation with institutional responses to government agendas.

A third thread is that transition could have been enhanced with targeted, accessible and accurate information and more career advice. Professional education and training occur at career crossroads, “leading on into different careers and further learning opportunities, [and] crossroads need good pathways and clear signposts” ([OECD, 2014, p. 89](#)). It can play such a critical role in helping young people navigate the different needs and pressures driving their decision-making process, raising awareness of options available and signposting new occupational opportunities constantly emerging in times of rapid change ([Agbenyo and Collett, 2014](#)). However, too often career guidance can be inaccurate and incomplete. For example, in the UK, research found that further education students considered the advice and guidance in their college was often too broad, generic and insufficiently tailored to individual needs ([Quyoun et al., 2021](#)).

In summary, one notes from the recent international literature many issues and ongoing debates. There are questions about the policy promotion of seamlessness, the nature of pathways—whether linear or divergent, the role of agency versus structure, what factors influence transitions, and the extent to which barriers remain. Other debates relate to the degree of fit between educational systems and labor markets, whether pathways are contributors to inefficiency, and the relative value of vocational vis-à-vis general qualifications in transitions and over a life-course. What is clear is that “new pathways to success are needed, as traditional routes to good livelihoods are no longer enough” ([Hughes and Smith, 2020, p. 8](#)). One of the key guiding principles when shaping policy and practice, according to [Hughes and Smith \(2020\)](#), is to make use of evidence to strengthen skills and create new pathways. Our main argument through this review of the key issues and debates has been that pathways and transitions are indeed complex, need to be analyzed within their context of skill formation systems and labor markets, and that in their interpretation there has been an over-emphasis on structure rather than agency. Given that much of the research evidence emanates from Europe and concentrates on young people’s entrances into labor markets, some different perspectives on pathways and their issues may be gleaned through examining the Australian situation where the skills formation system is largely post-secondary and focused more on whole of life and careers. Our discussion, therefore, turns to the Australian context to illustrate how the issues and debates highlighted in this review play out in that nation.

A case study: Australia

Australia is a federation comprising a national Government, six states and two territories. Its population is around 25.75 million. Many of the key issues related to its labor markets, approaches to career navigation and trajectories and the role of the tertiary sector in these have already been broadly highlighted in the literature cited in the first part of this paper. One of the issues in determining the effectiveness of pathways and their seamless use, therefore, is the way a country’s education sectors actually operate which, in turn, is affected by their design, funding arrangements and the relative status of their general and vocational education components. Another important one is the ways individuals actually use the education systems and the wide range of available transitions and pathways - their use of “agency”—a point strongly made earlier in this chapter drawing on the literature.

In this case study we examine the range of the enablers and barriers to pathways within and between labor market segments and most particularly into, out of and within Australia’s tertiary education sector given that post-secondary education is “where the action is”. It first considers the Australian labor market and the ways in which careers advice and other factors affect the availability and uptake of tertiary studies and pathways. This is followed by a consideration of Australia’s tertiary education system and the extent to which it enables or prevents effective responses to labor market needs and the ready availability of educational pathways. Another issue relates to the extent to which pathways are enabled, or not, by qualification frameworks (in this case, the Australian Qualifications Framework—AQF).

The Australian labor market

A 30-year perspective on the Australian labor market published by the Commonwealth Department of Employment, Skills, Small and Family Business ([Australian Government, 2019](#)), showed that, like other developed economies, significant structural change has occurred in its labor market, with a move away from production industries to more labor-intensive service industries and to higher level occupations with an increasing level of educational attainment being required and with a shift to a skills base that is not easily automatable. Such change has been accompanied by young people remaining in education for longer, increased female

participation in work and a move to flexible, part-time and more tenuous employment and an aging workforce with a rise in mature-aged participation even while transitioning to retirement.

Australia maintains skill shortage lists at both national and state and territory level. Persistent shortages are often addressed by a mixture of migration, education and retraining and by the use of data gathered by such agencies as the newly established National Skills Commission. The federal and state and territory governments attempt to encourage the take-up of education and training in response to these skill shortages, often through financial inducements such as fee-free VET courses. In June 2020, the (then) Australian Government announced a rise of 113% in the cost of studying humanities degrees and 28% for law and commerce, in order to fund an expansion of 39,000 university places and cheaper degrees for those studying courses in demand in the Australian economy such as teaching, nursing, maths, science and engineering (Karp, 2020). It is as yet unclear how successful this attempt at market engineering will be in effecting change in course choices and pathways. In the last few months, there has been a change of federal government, and it is still unclear how that will play out in terms of policy change and emphasis.

However, what is known is that tertiary study and course choice are affected by many factors: interest and passion; advice from significant others (e.g., parents, schools, careers advisors, workplaces and friends); quality of information about occupations and prospects; life circumstances; timetables, fees and affordability; possible sites of delivery or availability of flexible study options; and ease of access to the institution and chosen course of study (Brown, 2017). Thus, choice of career and chosen study programs can, in fact, be somewhat limited by circumstance and do not necessarily represent a rational or most desired decision but rather one that is more pragmatic, based on imperfect advice and information and the ready availability, or lack, of the desired course of study at decision time.

Careers advice and its quality in Australia

A range of Australian reports have called for well-targeted, accessible and accurate information and career advice, particularly for those moving into tertiary studies from secondary school, into and within the workforce or between VET and HE (e.g., BCA, 2017; Parliament of Victoria, 2018; Joyce, 2019; Education Council, 2020). The review by Joyce (2019) recommended the formation of a National Careers Institute. However, despite the important role careers advice and advisors play at this critical life period in connecting senior secondary students to further education and employment opportunities, many students feel they do not receive comprehensive and unbiased advice with many also feeling that they were pressured by schools and parents to pursue a university pathway, with VET being a less well-understood and preferred option (Shipley and Stubbley, 2018).

A recent review of post-school pathways recommended that students and their parents need to have access to earlier, more regular and intensive career advice informed by knowledge of the future labor market and delivered both face-to-face and online (Education Council, 2020). Thus, the focus of research in Australia has persisted on young people rather than those who are older, in mid-career or transitioning to other opportunities, either through personal ambition or circumstances such as redundancy or unemployment. Essentially, however, the process requires closer matching of skills to industry and individual needs and better information about emerging opportunities and trends as careers advice is important through an individual's life course and needs to be "lifelong and lifewide" (Guthrie and Nechvoglod, 2011, p. 16). Indeed, the Careers Industry Council of Australia had argued earlier that:

Well organized career development services have a significant contribution to make to the effective operation of Australia's education systems, to the efficient operation of its labor market, and to the effective development and use of the nation's talent and skills.

CICA (2007, p. 6).

Nevertheless, careers advice suffers from information asymmetry, and this is especially so for those in disadvantage (Bretherton, 2011). Guthrie and Nechvoglod (2011) advocated improvement in the quality of careers advice in Australia by promoting career management skills as a fundamental employability skill for all individuals; developing well-integrated, well-publicized, high quality, comprehensive, readily useable and accessible career information; providing a cascading level of service delivery particularly targeted at the most vulnerable "at risk" groups and providing genuine and comprehensive wrap-around services. In addition, it requires appropriate initial and ongoing training and professional development for career development professionals and others, better approaches to sharing resources and expertise, increased focus on employers and their role in the career development process and more effective evaluation of quality and impact of services.

The Australian tertiary system

In Australia, university education is generally seen as a national government responsibility in funding terms, while VET and schools are the principal funding responsibility of the respective state and territory governments. Australia's tertiary education system comprises just over 40 public and private universities and 127 non-university higher education providers (Norton et al., 2018) and a VET system with a total of around 3500 Registered Training Organizations (RTOs) (NCVER, 2021). The great majority of

RTOs are small, private providers, but there are over 20 large state- and territory-based and government-owned Technical and Further Education (TAFE) institutions, as well as six dual sector universities offering both VET and HE studies. In addition, there are enterprise-based RTOs, pathway colleges which specialize in diploma courses aimed at facilitating entry to university courses (Norton et al., 2018) and adult and community education institutions offering a wide range of general interest and preparatory courses as well as nationally accredited vocational programs. Schools also offer VET programs as part of upper secondary education. Most RTOs offer a limited range of courses, often in quite specific occupations and skill needs. However, some RTOs, particularly TAFEs, have a large number of course offerings – including at HE level – that are more substantive and address a wide range of occupational and skills needs.

Australia's National Centre for Vocational Education Research (NCVER, 2021) reported that, in 2020, there were a total of 3.9 million students enrolled in VET programs, with just over half enrolled in nationally recognized programs, mainly through the sector's national Training Packages "that are occupational skills standards against which training delivery and assessment of competency can take place" or accredited courses "which enable nationally accredited training in niche areas or in response to rapidly emerging industry needs" (Productivity Commission, 2020, p. 5.5). Much of the VET sector's education and training is delivered on a fee-for-service basis and an estimated 21.7% of the Australian resident population aged 15–64 years participate in a nationally recognized VET program (NCVER, 2021). Most students (around 72%) are enrolled in nationally recognized training at a private training provider, with 20% at a TAFE institute, 9.8% at a community education provider, and about 2–3% in each of enterprise providers, schools and universities (some enrollments span across provider types). It is to be noted, however, that because these data are for total VET effort,² many may be undertaking VET courses that are short and relatively specific rather than the more substantive programs that typically characterize HE studies.

According to the Federal Government's statistics for 2020, the HE sector has just over 1.62 million students, of whom around 90% are in public institutions, about 70% are studying full-time, 30.6% are postgraduates and the remainder undergraduates. Around 30% were international students studying in Australia, although numbers were affected when COVID-19 hit and borders were effectively closed for an extended period. Two clear differences are that HE students are generally younger with most aged under 24 while most VET students are aged between 25 and 64, and most in HE study full-time while most in VET are part-time.

Pathways into and within Australia's tertiary education

Pathways into tertiary education

The Longitudinal Survey of Australian Youth (LSAY, 2019) recently established that higher education is the preferred post-school destination for Australian Gen Zs with the majority (59%) planning to go to university or take a gap year (10%). Another 13% plan to get a job, and only 11% see an apprenticeship, traineeship or other VET study as their preferred option post school. In terms of actual destinations, just over two-thirds (69%) of those who planned to go to university are there, just over half (57%) of those who planned to work are working, while half (51%) of those who sought VET studies are studying in the sector. Furthermore, in terms of changing plans, 20% of those who planned to work are studying some form of VET and 35% of those who planned VET studies are working.

Shedding further light on this issue, another study into how Gen Z make decisions about their future reported that:

43% of young people have "no idea" what they want to do when they leave school. When survey respondents were asked why they believed this was, only 9% said "figuring out what I want to do is not a priority for me right now". According to a much larger proportion of the cohort, a lack of exposure to different careers (77%), life experience (68%), knowledge of all options (67%) and career advice/support (55%) were to blame for their confusion. (Shipley and Stubley (2018, p. 35).

The Education Council (2020) concluded that students and their parents need to have access to earlier, more regular and intensive career advice informed by bigdata analysis of tertiary pathways derived from the use of Australia's Unique Student Identifier (discussed below).

Pathways within tertiary education

Improving pathways for students between VET and HE has been a focus of sector attention and government policy since the early 1980s. Bradley et al. (2008, p. 21) noted that VET is a common pathway to HE for many people from under-represented groups. However, while the review saw that improving pathways is important, it did not believe that VET studies should not be considered a feeder for HE. Indeed, the reviewers also believed that VET's primary purposes must not be distorted by the need to increase HE participation.

In reality, it has been very difficult to determine movements within tertiary education and the associated study pathways because of the lack of comprehensive data. However, Australia has now developed a lifelong unique student identifier (USI), first introduced in 2015. It presently covers nationally recognized vocational training offered in both schools and post-secondary RTOs. From the

²From 2014, all RTOs, including private providers, unless granted exemption, must collect and report full data on all nationally accredited training, in accordance with the National VET Provider Collection Data Requirements Policy.

beginning of 2021, the USI was extended to HE to replace the present identifier (the Commonwealth Higher Education Student Support Number). Determining movements between sectors and the nature of qualifications undertaken could be achieved only through database matching in the past. A project to do this was undertaken by the former Commonwealth Department of Education, Skills and Employment.³ It estimated an annual flow rate of 14–16% of students from HE to VET and 0.4–1.3% from VET to HE, which it believed to be an underestimate. However, the size of these flows runs against policy and funding approaches that promote and privilege “onward and upward” pathways. Rather, pathways appear to be more complex as has been reported above. In addition, it found the majority of students were younger when attending HE with most (70%) aged under 24 compared with when they studied VET, where 76% of students were aged 25–64 years.

The study found that, of those moving from HE to VET, most had completed a bachelor’s degree (63%) while others had dropped out (26%) or were still enrolled (12%). Their most likely VET enrollments were short and applied non-AQF qualifications mainly in the Health field (e.g., first aid or occupational health and safety courses). These are often required by employers or volunteer organizations. On the other hand, those undertaking more substantive courses most often studied in the Management and Commerce or Society and Culture fields (e.g., psychology; law and criminal justice; community, social and support services; social sciences). Students transitioning from VET to HE had most often completed their VET qualification and then undertaken a degree in some field. Watson et al. (2013) found, however, that access to HE institutions from VET studies was variable and dependent on the institution to which they applied, mainly due to inconsistencies in admission policies and practices. Full implementation of the USI will mean that sound data on pathways and transitions, whether by articulation, credit transfer or RPL, will become a reality, but this will require a long-running dataset to allow for the time over which individuals move into and out of a variety of tertiary and less formal studies, and work.

Issues in developing a more coherent Australian tertiary education system

The significant issues in Australian tertiary education emerging from the academic literature, government and other stakeholder voices include the call for, and moves toward, a more connected sector with better articulation and credit transfer arrangements and more equitable and fair funding across the components of the sector, particularly for the VET’s publicly-owned provider TAFE. Rhetoric promoted by both the Australian Industry Group (AiG) and the Business Council of Australia (BCA), two of Australia’s peak employer bodies, and others, is that equal value should be given to both VET and HE (AiG, 2019; BCA, 2017; Expert Panel, 2019) so that they are a more coherent, equal and integral parts of a joined up and accessible tertiary education system with strong pathways between them and from school. However, as this chapter shows, such rhetoric seems not to be reflected in the current reality of career and study choices and related tertiary pathways.

Critically, there are differences in philosophy and perceived roles of the HE and VET sectors, and in approaches to qualification design and ratification and development of curricula. VET’s approaches are dominated by an “industry-led” and competency-based philosophy, which can act against ready credit transfer, articulation arrangements and student transitions to HE. Moreover, universities enjoy a level of independence and freedom of action, including self-accreditation, not afforded institutions in the rest of tertiary education.

Recently, AiG (2019) characterized tertiary education as a highly unbalanced binary model with no coherent policy and funding framework. Indeed, Dawkins et al. (2019) assert that the dichotomy between HE and VET in Australia has, if anything, become starker because of disjointed policy since a review of higher education in 2008 strongly advocated an inter-connected tertiary system (Bradley et al., 2008). Dawkins et al. (2019) consider that tertiary curricula, and particularly those in vocational education, need reform. This requires a rethinking of VET’s competency-based model which, they contend, has squeezed broader-based skills and capabilities to the margins of curriculum and hinders tertiary pathways, especially those between VET and HE. Universities also emphasize the different approaches to learning and assessment in the two sectors which represent a philosophical and pedagogical divide that affects the extent to which tertiary education can operate as a coherent educational sector with strong connections and pathways.

Approaches to tertiary funding and effects on pathways

Funding of tertiary education, particularly the entitlement of students to support, is also inconsistent across the sectors and the current entitlement funding approach privileges both HE (Hurley and Van Dyke, 2019, 2020) and upward pathways to higher level qualifications to the detriment of study and pathway options. The demand-driven funding of HE, which ceased in 2018, also distorted the tertiary education market by making it easier to study in HE because a deferred debt rather than an upfront fee was accrued (Burke, 2018). As early as 2008, Bradley et al. had recommended the introduction of a uniform tertiary entitlement funding model across HE and VET to ensure that student choices were not distorted by different levels of public subsidy for similar education and training depending on the tertiary education sector which delivered it (Burke, 2018). This view was supported by the Australian Industry Group (AiG, 2019). The Business Council of Australia proposed the development of a Lifelong Skills Account capped at a set number of years of accredited learning and a continuing system of associated income-contingent loans, along with developing

³See <https://www.education.gov.au/better-understanding-student-journeys>. Some sections of this present chapter have drawn on a redacted version of a more comprehensive report on this project supplied by the Department.

a culture of lifelong learning (BCA, 2017). Likewise, Dawkins et al. (2019) proposed a more comprehensive system of income contingent loans across VET and HE that would remove the up-front fees faced by many VET students. To date, the relative levels of tertiary funding remains contentious.

Perceptions of VET and higher education and effects on pathways

Australia's HE system has not experienced the same large-scale quality and regulatory issues and problems as the VET sector, brought about in VET's case by a strong move to a market-driven approach which enabled students to enroll in courses of their choice coupled with the introduction of a poorly conceived and executed income contingent loan scheme for its higher-level qualifications at Diploma level or above: VET FEE-HELP (Saccaro and Wright, 2018). Nevertheless, and more recently, HE has not avoided critique either. Reviews by the Productivity Commission (2019, 2017) raised concerns about the HE sector's declining admissions standards, increasing student attrition rates and declining graduate outcomes under the demand-driven system. Declining admission standards, coupled with parity of esteem issues and lack of knowledge about VET study options and pathways vis-à-vis university studies by parents and schools, opened the doors to university studies to a wider range of students, some of whom may have found VET studies and pathways more appropriate (and to which individuals subsequently turn, as has already been noted above). In addition, scandals associated with vocational education and lack of knowledge of the possibilities of VET study options among school students, schools, careers advisors and parents all acted to privilege university studies and pathways over those in VET immediately post school (Education Council, 2020; South Australia Department for Education, 2019; Shipley and Stubley, 2018).

Dawkins et al. (2019) proposed that entry requirements and pathways into and through tertiary education be liberalized and diversified to recognize better the diversity of knowledge, skills and capabilities students bring to tertiary education, especially if they have undertaken prior studies after leaving school. They, like others, believe that articulation arrangements into university courses need to be more transparent and attract more credit for prior studies. This has been difficult in the past due to relatively inflexible practices by individual universities (Watson et al., 2013) and interpretations of the "Qualifications Pathways Policy" of the Australian Qualifications Framework (AQFC, 2013).

Approaches to revitalize Australian VET

A number of recent reviews of Australian VET have been conducted at both federal (Joyce, 2019) and state levels (Macklin, 2021; Gonski and Shergold, 2021). Macklin's review in the state of Victoria recommended developing a new model for financing the VET system, including lifelong learning, and strengthening partnerships between the TAFE and training sectors, HE and adult and community education providers. This model would unblock the flow of students through segments of tertiary education to enable it to respond with more agility to the economy's needs by brokering better collaboration and pathways between component providers. Gonski and Shergold's review in the state of New South Wales proposed the development of a new type of tertiary institution: an Institute of Applied Technology with strong industry input and partnerships which would deliver fully-integrated theoretical and practical employability skills, provided through a number of constituent colleges, with curricula designed in collaboration with industry and focused on the state's emerging labor market needs.

A federal initiative is the VET Reform Roadmap, highlighted in a consultation draft prepared by the Skills Senior Officials Network (2020), which proposes a greater focus on high quality education, training and assessment focusing on excellence; speeding up and streamlining current training package arrangements and training products; developing stronger alignment and integration between VET and HE; and developing a new, simpler and more flexible model for national qualifications based around occupational clusters and across the full range of the revised Australian Qualifications Framework, including micro-credentials.

The most recent national review (Joyce, 2019) led to the development of a vision for VET and a Skills Package: "Delivering skills for today and tomorrow" (Australian Government, 2020). The Skills Package includes the establishment of (a) the National Skills Commission to provide centralized VET information and skills forecasts and develop approaches to VET pricing that balance consistency with local flexibility, and (b) the National Careers Institute to enable Australians to access accurate and up-to-date career information and support regardless of age and stage of study and work. Nevertheless, there have been issues with that review recently reported from a range of sources, including its failure to recognize and accommodate the need for cooperative federalism in VET and the adequacy of VET funding (Fowler, 2022). Finally, it has proved impossible—to date—to negotiate a new National Agreement for Skills and Workforce Development (NASWD). The recent change of federal government in 2022 may assist an agreement between the federal and state/territory governments being reached, however. Fowler (2022) noted the need for federal and state/territory governments to work collaboratively to find new constructive ways of working, or risk competitive stagnation of Australia's skilled workforce and labor productivity.

Australian Qualifications Framework and effects on pathways

The Australian Qualifications Framework (AQF), introduced in 1995, was one of the first developed in the world and has been a critical part of the Australian education and training system. It defines the essential characteristics of qualifications issued across the senior secondary education, VET and HE systems. However, the recent and widespread move toward micro-credentials, flexible delivery options and mechanisms to assist learners in constructing their own programs, sometimes across sectors to meet individual learning needs, has challenged the original AQF.

A Qualification Pathways Policy was developed (AQFC, 2013) with the intent to support students' lifelong learning. It also aimed to enhance student progression into and between AQF qualifications, recognize the multiple pathways that students take to gain AQF qualifications and that learning can be formal, non-formal or informal, and support the development of pathways in qualifications design (AQFC, 2013). However, the policy focused primarily on HE qualifications and did not have adequate regard for multi-directional or intra-sectoral pathways (Expert Panel, 2019).

A review of the AQF has now been completed (Expert Panel, 2019). It proposed more flexible and multi-directional learning pathways which are viewed as more suited to lifelong learning and rapid retraining to meet new technological challenges rather than the simple, hierarchical ones that characterized the original AQF. This new approach encourages RPL and workplace learning within or outside formal studies. At present, the necessary mechanisms are lacking to assign levels to "non-standard" learning options, or to regulate or quality assure credit toward formal qualifications for in-service or informal learning, or micro-credentials, in any way that ensures national or international consistency.

The review recommended that the Pathways Policy needed revision not only "to broaden guidelines for credit recognition across AQF qualifications and to define and provide for recognition of shorter form credentials, including micro-credentials, toward AQF qualifications" (Expert Panel, 2019, p. 9), but also "to provide equal emphasis to pathways from vocational education and training to higher education and from higher education to vocational education and training, and within sectors, by including examples of the pathways that are possible and any requirements associated with them" (p. 71). The development of a "prototype national credit points system" was also proposed for voluntary adoption so that:

Post-secondary education and training is conceived and redesigned as a diverse set of offerings, available through better linkages and pathways between the VET and higher education sectors. These linkages and pathways will no longer be linear and hierarchical; they will need to recognize that throughout adulthood, people need to develop new skills in different areas and at different levels. Central to this objective is reinvigorating the VET system and raising its standing.

Expert Panel (2019, p. 8).

Enabling courses (also called foundation, access, widening participation, pathway, bridging or tertiary preparation programs) are a feature of offerings in both vocational and community education in Australia, but are not currently recognized in the current early version of the AQF. Thus, students enrolled in an enabling course may not be able to transfer their learning to another institution due to lack of clear pathways or credit policy (Expert Panel, 2019). However, and as already noted, data show that the link is loose between formal training undertaken and destination occupations for the majority of courses. It therefore appears that the view of VET courses as occupationally specific is appropriate only for a few cases (Wheelahan et al., 2015; Wheelahan and Moodie, 2011; Karmel et al., 2008). This is also likely for those in HE, except when, as in vocational education, there are registration requirements linked to the attainment of particular qualifications (for example and across tertiary education: lawyers, doctors, electricians and plumbers).

Despite the several years since this review was undertaken and its recommendations accepted by the Federal Government, implementation has proved problematic and remains in the "too hard basket" because of the significant implications of its adoption, including national VET funding and financing approaches, qualification/credential re-design, flow-on quality and regulatory changes, plus disturbances to a multitude of legislative, industrial awards and professional standards all anchored to the current AQF (Fowler, 2022).

Conclusion

This chapter has examined the notion of tertiary education pathways in the contexts of labor markets and skills formation systems. It has drawn on recent international literature for an overview and then zoomed in on the Australian situation as a case study because of its largely post-school and whole of life focus.

Paying close attention to these research studies and different contexts contributes to our knowledge in at least two main ways. First, they enrich our understanding of the notion of learning pathway by nuancing its complexities and issues. They highlight several potential disjunctures between policy emphases and by better documenting the actual experiences of learners, areas ripe for further research. For example, these could include provision of various types of career guidance vis-à-vis actual use of them made by learners; between the policy emphasis on job-related training and the actual drivers for many learners who state that they study for personal interest or development reasons; and between policy expectation that pathways allow credit transfer and RPL and the actual amount of these applied for and granted. Analyzing the views of various stakeholders helps in developing our understanding of how phenomena are experienced by the actors themselves, thereby adding a valuable dimension to official interpretations from governments and media.

Second, they provide valuable insights into tertiary education practice. Deeper understanding of different types of pathways and how individuals use them can assist tertiary administrators in customizing initiatives to respond appropriately to changes in learners' lives, learning and work. It can raise significant issues concerning relationships between academic education and vocational education and can provide policymakers and institutional planners with insights into how best to fashion these relationships between sectors. For example, studies on learners' frequent moves between sectors and between sectors and employment unveil

how the sectors are playing complementary roles in providing for the needs of worker-learners at different stages through their careers. Moreover, an understanding of pathways can assist learners themselves to navigate through sectors with very different missions, cultures and practices. In Australia the tertiary sector is in a constant state of evolution, with a strong need to overcome parity of esteem and status issues for VET. It is a long way from understanding the dimensions and nature of pathways between study options and work.

Studies on transitions confirm that tertiary education is an important means for facilitating pathways into and through the labor market. Yet continuing vocational training has been labeled “the weakest link in lifelong learning” (Tessaring and Wannan, 2004, p. 6) and has been highlighted as one of five major priorities for promotion, along with tackling the large number of low-skilled people, increasing mobility to promote the development of the labor market, investing in quality VET systems, and ensuring high quality VET professionals. These areas represent fertile ground for continuing cultivation.

Augmenting vocational educational experiences to meet 21st-century work requirements

Constant changes in occupational and workplace performance requirements and increasingly dynamic working lives prompt fresh considerations about the goals for and processes of vocational education and training (VET), whether in schools or in specialized VET institutions. Central here are that these goals and processes are focused on generating adaptable learning outcomes: generating robust occupational knowledge in students. That is, VET must have the capacity to be applied beyond the circumstances of its initial learning and respond to changing occupational and workplace requirements. As part of meeting these needs in initial occupational preparation, VET students require workplace experiences to develop the capacities they require to (a) transition to effective work performance beyond graduation, and (b) respond productively to changing occupational and workplace performance requirements. Yet, there are important contributions from experiences provided through educational programs and processes and those from the workplace (Billett, 2009). Hence, the key consideration is for providing and augmenting these two sets of experiences so that the potential of the contributions of both can be realized. These premises shape what constitutes the purposes of vocational education in the contemporary era (i.e., adaptable occupational and/or workplace preparation), the kinds of curriculum and pedagogic practices (e.g., education experiences promoting adaptability) enacted to achieve those outcomes, and how students need to be positioned in initial and continuing vocational education (e.g., being adaptable workers).

This article proposes that to meet the requirements of the 21st-century workforce, VET provisions need to be directed toward educational processes that promote adaptability within the domain of occupational competence, premised on triadic foundations comprising (a) curriculum and (b) pedagogic practices directed toward generating student outcomes premised on foundations of occupational knowledge, and (c) engagement with and adaptive use of that knowledge by learners (i.e., students, workers). This requires accounting for the kinds of experiences provided to students in VET programs, and how those students should engage with and reconcile experiences provided by educational and workplace settings, as they each make specific and important contributions to both the development of occupational knowledge and the capacity to apply it adaptively.

In describing, justifying and discussing these three premises, this article seeks to explain how adaptive outcomes might be achieved through work-based experiences aligned with and augmented in vocational education programs. The conceptual premises are about the intersection among (a) experiences of different kinds being provided in educational and workplace settings through vocational educational programs, (b) the bases by which students come to engage in those experiences, and (c) the relations between the contributions of those two settings. The article outlines the changes requiring the reconfiguration of the goals for vocational education. These include (a) a growing focus on job readiness as well as occupational preparation, (b) an increasing requirement for conceptual and symbolic knowledge in contemporary work, and (c) the importance of being adaptive and innovative. Central to these changes is the key role that vocational education students and graduates play in being active and adaptive learners both in their initial occupational preparation and then in their ongoing development across lengthening working lives. Ultimately, the development of capacities required to be adaptable is something needing to be learned and enacted by individuals.

Having established these premises, models of vocational education curriculum that include workplace experiences are advanced. These emphasize the provision and integration of workplace or practice-based experiences into the overall curriculum. Broadly,

these responses are those associated with provisions of activities and interactions in vocational education institutions and workplaces that are structured to assist the development of adaptive occupational capacities to support graduates' transitions to initial employment and changing occupational requirements across working life through informed principles and practices. This all suggests the need to both provide and augment workplace experiences to support this learning. Beyond considerations about the sequencing, duration and means of integrating workplace or practice-based experiences are those about the selection and use of pedagogic practices to generate adaptive outcomes through conceptual, procedural and dispositional knowledge of the occupation, and something of its diverse manifestations in actual work settings. These pedagogic practices extend beyond those enacted by teachers and in classroom settings to include or replicate experiences in workplaces and/or educational settings likely to generate rich and adaptive occupational learning. Considerations of augmenting experiences in education and workplace settings are those associated with developing students' capacities to be active, effective and intentional learners at the commencement of, and across, their working lives.

Adaptability and vocational education

Being adaptable has always been important in responding to occupational and workplace challenges and has long been understood as a key quality of expert occupational performance (Ericsson and Lehmann, 1996). In the current era, responding to the constant changes in the requirements for occupational and workplace performance means that adaptability is becoming a core capacity for contemporary workers. Therefore, developing adaptable occupational capacities is a central goal for vocational education. Although adaptability is understood as comprising the ability to adapt existing knowledge to new challenges and novel circumstances (Stevenson, 1991), it is helpful to understand what constitutes adaptability and how contemporary views of it have emerged. Earlier, it was proposed that general problem-solving strategies could be developed that were applicable to any circumstances, suggesting some forms of knowledge are inherently adaptable (Bartlett, 1958). These capacities are not restricted to specific activities: they included literacy and numeracy that, it was claimed, can be applied across domains of activities, both within and outside of working life. Such claims led to a focus on general problem-solving strategies and interest by governments in key or core competencies. It was claimed that, once learned, these capacities could assist the person in responding to new challenges, regardless of the domain of knowledge in which the challenges were being confronted (Mayer, 1992; The Secretary's Commission on Achieving Necessary Skills, 1992). It has been suggested that engaging in gameplaying or science (Bantock, 1980), can lead to logical thinking and enhanced problem-solving that could have a wider application. When advising UNESCO about educational processes for the future, for instance, Faure et al. (1972) favored general problem-solving over specific occupational preparation. They argued that, because the requirements for occupations and work are constantly changing, students should learn problem-solving strategies rather than being prepared for specific occupations. However, both these claims and more recent manifestations promoting generic skills or competencies have found to be wanting. They ignored existing (Anderson, 1982) and an emerging body of findings claiming that responding to novel tasks or nonroutine problems is seen to reside within specific domains of activities (Chi et al., 1982; Sweller, 1990a,b): Cleverness (i.e., the ability to manipulate knowledge) is insufficient for nonroutine, domain-specific problem-solving (Chase and Simon, 1973), and situational and procedural factors challenge the efficacy of broadly transferable knowledge, even in maths (Bishop, 1991; Carraher et al., 1985). That is, without having knowledge of the domain in which the problems arise and are to be solved, general problem-solving strategies have very limited potency. Certainly, the importance of domain specificity (e.g., occupations) is repeatedly emphasized in studies of expertise (Glaser, 1984; Ericsson and Lehmann, 1996). Indeed, the hallmark of expertise is an ability to perform nonroutine problem-solving within that domain. Yet, more than being competent within an occupational domain, the requirements for, practice of and judgments about what constitutes effective performance are manifested situationally (Billett, 2001). That is, performance requirements for what constitutes expertise are situated in specific circumstances of the occupational practice. This means that domain-specific competence at both the occupational (i.e., canonical) and situational levels are necessary, as is adaptability across them. In short, as with earlier versions (i.e., key competences, SCANS), capacities posited as 21st-century skills and processes of adaptability need to be embedded in domains of occupational knowledge and its practice.

So, when referring to the development of occupational skills through vocational education, that development must be directed toward two kinds of domains: canonical occupational knowledge (i.e., requirements of that occupation) and the domain of activities within a specific workplace or practice (i.e., performance requirements within the work setting); that is, being adaptable within a domain of occupational knowledge manifested in the circumstances of practice (i.e., workplace/work practice; Billett et al., 2018). Rather than vocational education efforts being directed toward generic problem-solving strategies, the focus needs to be on developing the capacities that permit graduates to engage in effective problem-solving within specific domains of occupational knowledge, taking into account how that knowledge and its use are manifested in particular work situations (Billett, 2001). What this suggests is that there is no such entity as an occupational expert per se. Instead, expertise needs to be judged in terms of practitioners effectiveness in engaging in nonroutine problem-solving in specific work settings. This suggests that a foundation of occupational knowledge is required prior to efforts to promote adaptability (Alexander and Judy, 1988; Gelman and Greeno, 1989). The salience of this adaptability is also emphasized in the Program of International Assessment of Adult Competence (PIAAC) data that indicate all classes of contemporary workers engage in extensive and frequent nonroutine problem-solving and, therefore, adaptability is central to responding to nonroutine problem-solving (Organisation for Economic Co-operation and Development, 2013). All of this is consistent with the concepts of canonical and situational occupational knowledge (Billett, 2017). Responding to occupational challenges in workplaces, addressing clients' problems and needs, requires the capacities to adapt occupational knowledge

to meet those requirements (Ericsson and Lehmann, 1996). Consequently, more than vocational education being focused on developing occupational knowledge per se (i.e., national occupational standards), central here is generating student capacities that include that knowledge being applied in different ways and having the adaptive capacities to understand the circumstances of and requirements for adapting to emerging challenges and new situations.

An important element of those capacities is the active and agentic engagement by VET students. It is they who need to construct the knowledge (i.e., learn), apply it adaptively and interact with others in doing so. Importantly, developing those capacities and responding to these changes is often associated with interdependence; that is, through individuals working and learning with others and in ways that promote the accessing of an engagement with knowledge that is socially generated. Occupational knowledge arises through history, culture and situation (Sennett, 2008), which means individuals need to engage with the world around them to access and learn that knowledge through interacting with it: inter-psychologically (Wertsch, 1991). Through interaction with others, particularly those who are more experienced or informed, shared learning arises in ways that are reliant upon the contributions of others and objects (Newman et al., 1989). Yet, in terms of change, the interdependence between the workplace and the worker comes to the fore. The workplace requires workers to have the capacity to respond to new challenges and generate new procedures and practices to achieve workplace goals (Billett, 2014). Without the actions of the workers the workplace would become moribund and unable to advance. Yet, workers also need the workplace, the contributions it provides and its role in continuing to develop that knowledge that is so central to being able to respond to emerging and novel challenges.

The key points here are that vocational education's purposes are about developing occupational capacities, but in ways that are adaptable to specific workplace settings and novel tasks that arise in them, as well as the routine activities that constitute existing practice. These are all key elements that are required to respond to the kinds of workplace challenges that exist and are emerging for contemporary workers, seemingly in ever more demanding ways.

Key changes reconfiguring the goals for and processes of vocational education

The constant changes to occupational practice and workplace requirements outlined above have direct implications for the provision of vocational education. These include: (a) a focus on job readiness as well as occupational preparation; (b) addressing the specific needs of workplaces; and (c) accessing and learning the kinds of conceptual and symbolic knowledge required for processes. Each of these changes is discussed briefly to indicate implications for vocational education.

Job readiness as well as occupational preparation

In the modern era, the role of vocational education has been to prepare people for working life and specific occupations (Department of Innovation and Universities and Skills, 2008). This role emphasizes identifying occupational requirements and then preparing students to meet them. Statements of these requirements have been generated through professional associations or licensing bodies for many occupations. Consequently, external bodies such as peak industry bodies, including those of employers and unions, have played a significant role in identifying those requirements and advising on what content should be taught, the kinds of assessments students will be subjected to and how those assessments are conducted. Hence, there has been a great focus on national curriculum and occupational standards, and these are set as the goals toward which vocational education's processes and outcomes should be directed. However, increasingly, employers, governments, community and students themselves are now expecting that graduates from vocational education programs should be "job ready" (Billett, 2015a); that is, able to effectively perform in specific workplaces. This is a particularly tough goal for vocational education, and hugely demanding on students, as they do not know where graduates will find employment, and therefore can be prepared and acquitted as being job ready. There is also considerable difference between curriculum intents and experiences designed to meet the needs of occupational requirements and regulations, those associated with meeting the requirements of specific workplaces, and the need to be adaptable in both. So, this growing emphasis and expectation that students from vocational education will be able to move smoothly into employment in a specific workplace requires a different set of educational goals and processes than those associated with occupational readiness as the traditional goal for vocational education. This requirement extends to knowing something about the variations of occupational practice and the reasons for those variations and their consequences for work performance. So, this change warrants a significant reconsideration of educational goals and processes.

Educational goals: canonical, situational and adaptability

Education is an intentional process. It is guided and driven by specific kinds of intentions (e.g., goals, aims, objectives) generated by contributions and insights from a range of informants, balancing among these contributions and selecting and generating kinds of educational intents (Marsh, 2004). Very rarely is the development of educational programs and processes the product of individual teacher decision-making alone (Skilbeck, 1984). Instead, it reflects the involvement of a range of interests, contributors and perspectives. Also, the degree of specification for educational processes can vary from being wide and open to being highly specific. The latter often occurs within preparation for occupations because, increasingly, there are specific occupational requirements that need to be met. What electricians, pilots, nurses, builders and so forth are required to perform is regulated, and vocational education provisions need to address those regulations. Following from what has been proposed above, it is helpful to consider occupational

preparation in terms of it comprising canonical occupational knowledge (Billett, 2017), that is, the knowledge required by anybody practicing that occupation: what people need to know, do and value. Knowing refers to factual, conceptual, propositional and causal knowledge (Prawat, 1989). Being able to secure goals is achieved through procedural knowledge that ranges from highly specific procedures (to achieve individual tasks) through to strategic procedures required for planning and evaluating work activities (Anderson, 1982; Ericsson and Lehmann, 1996; Sun et al., 2001). There is also a consideration of values—the dispositional qualities of interest and intentionality that are central to how individuals undertake their work (Perkins et al., 1993). It is, together, these three forms of knowledge that underpin effective work performance, and what some refer to as expertize (Ericsson et al., 2018).

All of these forms of knowledge become the goals for vocational education at both the occupational and situational levels. Often, those goals are captured in national standards and statements of occupational competence and presented in syllabus documents, usually focused on the canonical occupational knowledge to be learned. However, there is also a need for goals associated with understanding situational requirements that permit job performance in a specific workplace/work practice (Billett, 1998). Added to this are those associated with developing the adaptability that permits what has been learned to be employed in other circumstances and tasks than those in which and through which they were learned. So, the educational intents need to include how students might come to learn something of the diverse kinds of workplace performance associated with their occupations. Central here is development of adaptability in students: extending what they have learned to be applied in circumstances other than those in which it was learned.

Consequently, the challenge for vocational education is for its students to understand something of the diversity of situational requirements and to expose students to instances of that diversity and allow them to appreciate the range of requirements arising from it. Engagements and partnerships with local employers and industry representatives and those from professional bodies are likely to clarify these requirements. Those kinds of engagements are also hallmarking for what constitutes mature vocational education systems (Billett, 2013; Deissinger, 1996), in particular, when those engagements include students spending time and engaging in workplace settings and engaging in purposeful and authentic tasks. A key emerging requirement for such engagements now extends to the deliberate development of conceptual and symbolic knowledge that underpins the use of much electronic technology that comprises 21st-century work, yet can be hard to learn.

Securing “hard to learn” knowledge

Much existing and “future work” is likely to be reliant on conceptual and symbolic knowledge (Barley and Batt, 1995; Hull, 1997), including what is held to comprise 21st-century skills, that is, the knowing that needs to be mediated through concepts and symbols, because this kind of knowledge cannot be directly expressed or experienced (Harteis, 2018b). Much of this learning is associated with understandings premised on knowledge that is opaque and difficult to access and, therefore, to learn (Harteis, 2018a). Across human history, and increasingly, this kind of knowledge has been used to represent meanings that cannot be easily stated or represented. The use of symbols to denote chemicals or factors such as those used in mathematical calculations or physics are instances of symbols that require those using them to understand their meaning and be able to manipulate them to achieve goals (Vosniadou et al., 2002). Examples here include the growing use of technologies in fields such as banking, clerical work, as well as healthcare (Hajkowicz et al., 2016). This kind of knowledge is often associated with changes in how work is conducted and how individuals come to mediate it. Scribner (1985), with great prescience, stated: “Hardly have we approached the problem of understanding the intellectual impact of the printing press and we are urged to confront the psychological implications of computerization” (p. 138). Scribner sought to understand these changes through a comparison between the use of manual lathes and those which are computer numerically controlled (CNC lathes; Martin and Scribner, 1991). She noted how these new kinds of lathes required a shift away from those operated through human sensory processes (i.e., vibrations, noise, smell, sight) to those that integrated traditional machining knowledge with symbolic knowledge and logical skills, enacted by computers (Martin and Scribner, 1991). These kinds of knowledge are difficult to learn because there are often too difficult with which to engage. However, they need to be constructed by individuals (i.e., learned) because they become personal tools to mediate work and learning. These forms of knowledge are not restricted to technology: they exist in different forms and ways of knowing for experts, comprising concepts and heuristics upon which they draw.

However, what we know is that these forms of knowledge can be difficult to learn because they are not easy to represent and are often abstracted from the circumstances of use. Therefore, they are difficult to engage with, remember and recall. For instance, science education has long struggled with identifying the most effective ways of representing this kind of knowledge for students to come to understand science and physics. Concerns about force, vectors, stress on physical components et cetera need to be understood through systems that require this kind of conceptual knowledge. Yet, there are practical ways of seeking to make these forms of knowledge accessible, and it is these that need to become part of the considerations for vocational education to address the requirements of what is referred to as 21st-century work.

Responsive vocational education curriculum and pedagogic practices

As foreshadowed, there is a growing need to be responsive in terms of curriculum and pedagogic practices to these challenges. This includes, for instance, providing authentic occupational experiences either in workplaces or through activities within vocational education institutions. Given the limitation of transferring what is learned in substitute environments to where it is to be applied, such experiences are increasingly seen to be important (Ericsson and Lehmann, 1996). A key source is the provision of workplace experiences such as practicums, clinical placements, internships and other forms of work experience (Billett, 2009). It is these

structured experiences that are central to identifying preferred occupations or specialisms, assisting in the development of occupational capacities, and intentionally developing adaptability. However, more than providing experiences in education institutions and workplaces, it is necessary to optimize the integration of specific kinds of learning that arise through the two sets of experiences for students and reconciling them to be generative of adaptable occupational knowledge (Cooper et al., 2010). These processes need to commence before students engage in workplace experiences, during, and then after them. As noted, the developing occupational adaptability likely requires establishing a platform of occupational concepts, procedures and associated values, and exposure to variations and diverse manifestations of those practices (Billett, 2015a). These stand as a means of assisting students and graduates to be aware that occupational knowledge needs to be adapted to the circumstances of practice. Equally, securing knowledge that is hard to learn—conceptual and symbolic knowledge—requires kinds of pedagogic practices and engagements by learners. Those forms of knowledge that are hard to directly experience require specific educational interventions. Such pedagogic practices are not restricted to securing knowledge per se, but also their active engagement by learners. The processes require developing initial occupational competence through reconciling experiences of different kinds through to the ongoing development of that knowledge prior to and during working life, demanding a level of agency by the learner. Learning strategies, rather than teaching, are likely to be required for the ongoing development of workers' knowledge across lengthening working lives; that is, not based as much on teaching, but on curriculum, pedagogic and personal practices associated with learning.

These considerations lead to questions about the kinds of curriculum and pedagogic practices that can support occupational competence, job readiness and adaptability, and that can sustain employability across working life. These issues are addressed in the following sections that offer six considerations: (a) organizing and providing workplace experiences, (b) intentionally and actively integrating students' experiences, (c) institutional-based activities that incite authentic work experiences, (d) educational processes promoting adaptability, (e) securing hard to learn knowledge, and (f) promoting learning agency. It is these six practices that are addressed in turn.

Organizing and providing workplace experiences

With emerging focuses for vocational education on workplace or job readiness and understanding variations of that knowledge, the imperative for having workplace experiences becomes pre-eminent. These experiences provide access to (a) authentic activities and interactions; (b) richly contextualized experiences that engage students in multisensory ways and provide clues and cues about how they need to engage in their work; (c) purposive goal-directed activities aligned with the kinds of knowledge students need to learn for their targeted occupations; (d) goal-directed activities requiring the resolution of problems and through them, learning; (e) securing episodic workplace experiences from which important causal and propositional links are developed; and (f) the ability to monitor the activities in which they engage (Billett, 2015a).

Securing these processes depend on the kinds and duration of workplace experiences, and how students are supported in workplace settings. Nevertheless, these kinds of experiences are not usually accessible within vocational education settings. These work-based experiences make pertinent contributions to students' learning; they are not just complementary experiences provided by educational institutions. Yet, there is a need to integrate the two sets of experiences.

Intentionally and actively integrating students' experiences

As noted, workplaces provide learning experiences and outcomes that are often quite different from those provided and secured through vocational education institutions. Consequently, there is a need to include and integrate these experiences within tertiary educational provisions (Cooper et al., 2010). As noted, the focus here is on organizing and providing these experiences in ways that assist the development of students' occupational capacities (i.e., canonical knowledge), while engaging them with particular instances of practice and the use of instructional strategies to integrate those experiences and learnings into the vocational education program (Orrell, 2011). So, again, there is need to consider both curriculum (i.e., the provision of experiences) and pedagogies (i.e., augmenting educationally those experiences). The findings of a project involving numerous tertiary education institutions on the integration of workplace experiences identified curriculum and pedagogic practices that need to be adopted (Billett, 2011). In Table 1, issues associated with the intended (i.e., what is designed and planned), enacted (i.e., what occurs with implementation) and experienced (i.e., what students experience and learn) curriculum are set out, drawing from those studies.

There are sets of considerations in Table 1 for how the intended curriculum (i.e., what is planned) needs to be organized to optimize the integration of students' experiences in work settings. Also, there is a set of practices associated with the enactment of the curriculum informing practices and priorities associated with this implementation. Then, and perhaps most importantly, are a set of considerations about how students will come to understand and engage with what has been implemented and experienced by them (i.e., the experienced curriculum).

Beyond these curriculum considerations are those associated with pedagogic practices to augment the curriculum experiences through processes that assist students to integrate and reconcile their experience in work settings. In Table 2 are some suggestions regarding educational interventions that might be enacted before, during and after workplace experiences. These comprise preparatory activities prior to students engaging in work settings, and interventions promoting student learning during their workplace experiences. Also, it was found that having interventions after the students have experienced work practice was particularly helpful as students could then compare, share and critically appraise their experiences with their peers (Cardell and Bialocerkowski, 2019). These activities provide bases to develop understandings about the occupational practice, and variations of that practice in action

Table 1 Curriculum considerations for integrating workplace experiences (Billett, 2015a).

<i>Intended curriculum—what is planned</i>	<i>Enacted curriculum—what is implemented</i>	<i>Experienced curriculum—what students experience and learn</i>
Being clear about what is to be learned through workplace experiences	Augmenting or maximizing available opportunities (e.g., appropriate settings)	Students' interest and readiness central to their engagement and learning in practice settings, and reconciling it with their coursework
Aligning experiences provided for students with the intended learning outcomes	Considering options other than supervised placements to secure experiences	Immediate concerns (e.g., performing in practicum) are focus of students' interest
Aligning the duration of experiences with educational purpose (e.g., orientation vs. skill development)	Accounting for students' readiness (e.g., interest, capacities, confidence) when selecting and enacting experiences	Early and staged engagement in practice settings boosts many students' confidence to re-engage and learn effectively
Intentionally sequencing preparatory experiences to secure, consolidate and reconcile learning from practice experiences	Additional or specific experiences may be needed for student cohorts (e.g., overseas students)	Challenges to personal confidence and competence can be redressed by effective group processes, including sharing of experiences

Table 2 Pedagogic strategies promoting integration of workplace learning experiences (Billett, 2015a).

<i>Before workplace experience</i>	<i>During workplace experience</i>	<i>After workplace experience</i>
Orient students to requirements for effectively engaging in work practices	Direct guidance by more experienced practitioners (i.e., proximal guidance)	Facilitate the sharing and drawing out of students' experiences
Clarify expectations about purposes of, support in and responsibilities of parties in practice settings etc.	Active engagement in pedagogically rich work activities or interactions (e.g., handovers)	Make explicit links to, and reconciliations between, what is taught (learned) in the academy, and what is experienced in practice settings
Prepare students to engage as agentic learners (e.g., importance of observations, engagement)	Effective peer interactions (i.e., students' collaborative learning)	Emphasize the active and selective qualities of students' learning through practice
Develop procedural capacities required for tasks in the workplace	Active and purposeful engagement by the students as learners in the workplace	Generate students' critical perspectives on work and learning processes
Prepare for contestations that might arise		

(Williams et al., 2019). This phase also has the potential for students to develop understandings about practice in action and to develop critical capacities to appraise work situations and the efficacy of kinds of practices they might enact, through processes such as reflection (Noble et al., 2019). Moreover, engaging students in this kind of thinking and acting provides the basis for their own personally managed ongoing learning once they engage in their occupational practice in work settings beyond graduation.

It follows from the project's findings that there are actions that can be taken in the design and implementation of vocational education programs that can assist in the effective engagement in and integration of students' experiences in workplaces. Perhaps most important, were the interventions occurring after students had completed their work experiences as these provided bases for students to develop knowledge from what they had experienced and engage critically, comparatively and in an informed way with peers (Billett, 2019).

The two sections above emphasize the importance of providing and integrating vocational education students with authentic experiences associated with their preferred occupations and, wherever possible, with access to some variations of those experiences. It has also been suggested that educational processes can reconcile experiences in work settings with those in the vocational education situations. However, it is not always possible to provide students with workplace experiences: Some countries have very strong traditions of providing workplace experiences, whereas others do not. So, there are also considerations for what can happen within vocational education institutions to provide authentic experiences.

Institutional-based activities that incite authentic work experiences

Not all vocational education students can access work experiences, perhaps for institutional and cultural reasons. So, while it is very common in Germany for vocational students to engage in significant work experiences, in the Netherlands there is not such a strong tradition of providing students with work experiences. Instead, vocational education institutions and applied science universities there have a tradition of providing what is referred to as hybrid experiences within those institutions (Zitter et al., 2017). Students are provided with simulation or project work intended to equate to the kinds of activities occurring in occupational practice. This is also the case in Singapore where many of the postsecondary education institutions (i.e., the polytechnics and the Institute for Technical Education) also provide project-type activities within the institutional setting. For instance, in one of the polytechnics, the information technology students engage in assisting other students with setting up their laptops and tablets with the institution's

electronic systems and engage in a helpdesk and troubleshooting when students have problems. That is, the information technology students are engaging in authentic activities associated with that domain of work.

There are two broad considerations here: curriculum and pedagogy. In terms of curriculum—the activities that are organized for students and their sequencing—consideration of shared or individual projects associated with the field of study, simulated activities (e.g., training restaurants, legal centers, broadcast and print media, healthcare clinics) can provide students with educational activities that are closely linked with their intended occupation (Zitter and Hoeve, 2012). This approach engages students in the kinds of goal-directed activities associated with their preferred occupation. They can have high levels of authenticity in terms of the knowledge targeted for them to learn. Also, these kind of projects and simulated activities engage students actively in educational processes, thereby providing experiences and realizing outcomes that more passive forms of education are unlikely to be able to achieve. That is because students are placed in the “driver’s seat”: they must make decisions and complete actions and monitor and evaluate the efficacy of those actions. This kind of engagement and of thinking and acting is necessary for developing the higher order capacities required for many occupations (Evans, 1991; Stevenson, 1991). So, these kinds of experiences can be made authentic in terms of the sorts of activities and interactions and can assist students in generating the kind of understandings that allow them to learn that knowledge in ways that demand knowledge utilization, stimulate recall, and are aligned with performing occupational tasks upon graduation.

In terms of pedagogic practice, establishing these projects and ensuring that the criteria for them and support for their enactment are adequate, are all important. As noted above, a central consideration for pedagogic practices is to organize and implement activities for students that engage them in the kinds of thinking and acting that are required for the occupational practice and in ways that progressively engage them in more demanding and effortful activities. For instance, when I was teaching in vocational education in the field of garment design and manufacturing, students would commence with designing and producing garments that were relatively easy to complete (e.g., skirts), before designing and producing more complex garments such as dresses, jackets, suits, et cetera. The pedagogic practices here are to carefully select and organize the activity, support students’ engagement in it, and then guide their thinking and acting as they progress with the activity. Added here are teachers’ ability to use narratives and storytelling and to verbalize the kinds of knowledge needing to be learned. When they use instances from practice it is likely to be particularly helpful for students to learn and recall what has been taught, as it provides a basis for indexicality: the means by which individuals organize and recall their knowledge, which is essential for expert performance (Ericsson and Lehmann, 1996). Activities that emphasize the utilization of the knowledge outside of the circumstances in which is being taught will assist students to learn about the applicability of that knowledge through providing experiences which are not able to be directly engaged by them. Hence, educational processes that promote adaptability are important.

Educational processes promoting adaptability

A fundamental goal for education is for the capacities that have been developed through it to be adapted to circumstances beyond where they have been learned, as noted. Consequently, a key concern for vocational education is for students to develop the capacities to adapt what they have learned to activities and circumstances beyond the institution. This assists in developing their ability to apply what they have learned to its application in work practices, and also across the length of their working lives, as they face changes in occupational and workplace practices. So, adaptability is foundational and fundamental, if not the defining quality of educational provisions. Yet, there are specific challenges associated with hard-to-learn knowledge and the development of conceptual and symbolic capacities required for 21st-century work that challenge such adaptability. These kinds of learning are not easily derived from direct teaching. Instead, other kinds of experiences are often required, albeit supported by teacherly practices. A key consideration for vocational education is making accessible and comprehensible the conceptual and symbolic knowledge. This kind of access can be provided using stories, analogies, explanations, and illustrations by teachers, drawing upon specific instances of practice that exemplify and illustrate the concepts being used. A key curriculum goal is, therefore, the development of adaptable understandings and practices (i.e., informed principles and practices) that promote adaptability. This comprises identifying and assisting students to develop understandings and procedures that optimize their ability to adapt what they know, can do and value to changing circumstances. These outcomes can be realized in a range of ways, one of which is the direct teaching of such principles and procedures, but most likely supported with authentic examples and instances of work. Then, mnemonics derived from practice can be used to assist with the development of procedural capacities (i.e., to assist recall of a comprehensive range of potential considerations). Another approach is for students to share with peers their different kinds of work experiences and engage in identifying what is common across the enactment of that occupation (i.e., the canonical knowledge of the occupation) and what is specific to work settings (i.e., situational requirements). This is an activity that can be undertaken once students have had workplace experiences. It is the combination of developing canonical occupational knowledge alongside the understandings of variations and situational requirements that provides the bases for using occupational knowledge adaptively. Engaging with other students to compare their experiences of work settings, albeit facilitated by teachers, can open up a range of options and possibilities that permit them to realize that there are variations in that practice, and for what reasons and how these might be accommodated within enactment of the occupation (Billett, 2015a). Consequently, providing opportunities for students to engage in sharing, discussion and dialog are likely to be important, as are, if possible, students rotating through different kinds of work settings and circumstances of occupational practice and having opportunities to consider what is common and distinct about performance requirements in these different circumstances. For instance, for a long time, nurse education was undertaken wholly within hospitals with trainee nurses rotating across different kinds of hospital wards. This array of experiences provides the opportunity to

understand the canonical knowledge of nursing, on the one hand, and on the other hand to identify specific nursing requirements in different kinds of wards. Even then, those experiences alone may be insufficient unless there is the opportunity to consider, discuss and extend knowledge about those practices.

This concern with adaptability is fundamental to the educational project. Educational institutions and their programs have been established not just for learning that is relevant to them: the learning needs to be applicable to circumstances and activities that are distinct from those enacted in educational institutions. Consequently, focusing on strategies that seek to extend the applicability of what students come to know, do and value is likely to be a crucial consideration in vocational teaching. This is particularly relevant in the contemporary era where change in workplace and occupational requirements occurs so frequently.

Securing “hard-to-learn” knowledge

A specific quality of the 21st-century work referred to above is the increased use of conceptual and symbolic knowledge as part of workplace performance requirements. This kind of knowledge has increased with the use of technology and is often what mediates work performance when using tools and artifacts. However, there are three concerns associated with learning conceptual and symbolic knowledge. Firstly, it can be difficult to capture in written form (e.g., force, electronic systems, information processing). Secondly, it can be difficult to access because there is no direct engagement with it (e.g., it cannot be directly experienced). Thirdly, these kinds of knowledge are often difficult to be taught, and therefore need to be learned. Science education has long struggled to address this problem in school classrooms: that is, how can students learn concepts that they cannot directly experience? Literature from that field suggest the importance of making that knowledge explicit in some way (through the use of examples, instances, representations; able to be experienced or engaged with or even visualized and then having students construct meaning from those explicit representations; [Billett, 2018](#)). One aspect of this is the lessening need for the direct use of tools that must be manipulated manually and the importance of ergonomic type capacities such as deftness of hand movements ([Harteis, 2018a](#)). As foreshadowed and as elaborated below, much of the conceptual and symbolic knowledge required for contemporary work cannot be experienced directly through physical sensation. Consequently, the means of it being learned may require kinds of interventions to promote its development ([Vosniadou et al., 2002](#)). It is necessary, therefore, to promote learners’ agency to be effective, outward looking and intentional in the activities and interactions from which they learn ([Goller, 2017](#)). It is these educational responses that are used to propose how vocational education can proceed with developing skillful and adaptable workers.

For vocational education, more broadly, the kinds of pedagogic divisions and practices required for developing conceptual knowledge are as follows. Firstly, consideration needs to be given to the kind of experiences and forms of learner engagement that are most likely to be able to represent that knowledge, on the one hand, and on the other, having processes that students come to engage with it. It has been suggested ([Brown et al., 1989](#)) that developing a conceptual model of the task is important as this provides learners with:

- an advanced organizer for attempting to execute the task;
- bases to utilize feedback, hints and corrections during interactions;
- an internalized guide for independent practice by successive approximations; and
- a conceptual model which can be updated ([Collins et al., 1989](#)).

These kinds of considerations can be helpful as students construct this “hard-to-learn” kind of knowledge. All this needs to be underpinned by the provision of authentic activities that provide concrete instances of how that knowledge needs to be utilized and for what purposes and these activities also assist with indexicality (i.e., the construction of knowledge in ways that permit its utilization and recall). So, it is these kinds of pedagogic practices that are likely to be helpful for developing this “difficult to access” knowledge that is becoming increasingly part of contemporary work life.

Promoting learning agency

Across the considerations advanced above is the enduring focus on learner engagement. We are reminded here that vocational education provisions are nothing more or less than invitations to change. How students take up these invitations is fundamental to the effectiveness of any educational provisions. So, student engagement and agency are central to effective vocational education, and to how graduates come to adapt their occupational or work-related knowledge to circumstances beyond the educational provision and engage in the kind of effortful learning required for productive working life ([Goller, 2017](#)). That agency shapes the focus, intensity and direction of vocational education students’ learning. However, there are some key premises associated with promoting learning agency that are outlined briefly here. Firstly, student readiness (i.e., their ability to engage in activities), and an awareness of that readiness, is an essential starting point for encouraging students to be proactive, interdependent and directed in their activities and learning ([Billett, 2015b](#)). Secondly, having goals and processes that warrant student engagement seems to be important. That is, having activities that are relevant to what needs to be learned, interesting enough to engage students and to be perceived by them to be sufficiently worthwhile to engage them in the kinds of effortful processes required to generate the linkages and associations among conceptual knowledge, and the associated considerations required for strategic procedural practices. Central to that engagement is developing a strong sense of subjectivity associated with the occupation that will encourage students to engage effortfully in its learning. That is, an important goal is to assist students in coming to recognize their occupation as their vocation. Fourthly, and consequently, selecting and providing experiences that engage learners and that they would be interested in engaging effortfully is

likely to be required for the kinds of learning needed to become adaptable occupational practitioners. Part of that curriculum and pedagogic process is to place learners in the circumstances where they must take responsibility for their thinking, acting and learning. This does not suggest or imply that there is no role for teachers. Instead, teachers' role is to guide and support vocational education students, but primarily, the focus is on the agency and interdependence of learners.

Practical consideration for developing these capacities is having students evaluate their peers' processes and outcomes and this kind of activity can develop the kinds of evaluative and critical capacities that people need to develop to effectively monitor and evaluate their own work practices.

Developing a skillful and adaptable workforce

It has been proposed in this article that changes in occupational workplace requirements and working life, and specifically the development of what is referred to as 21st-century skills, prompt a reappraisal of the goals and processes of vocational education. A broader view of curriculum and pedagogies need to be considered, engaged with and enacted to accommodate changes in educational goals for vocational education. These include addressing the specific requirements of workplaces as well as developing occupational competence; learning knowledge that is difficult to experience directly (i.e., conceptual and symbolic knowledge) but that is required for what is often referred to as knowledge work; developing adaptive occupational capacities because the requirements for work and work performance are constantly changing and because of the importance for students to become active and intentional learners for their initial preparation, but also that ongoing development across working life. It is proposed here that a way forward is to adopt curriculum and pedagogic practices that are aligned with achieving these kinds of outcomes. This includes a consideration of what constitutes effective educational experiences (both within educational institutions and workplaces), ordering and reconciling these two sets of experiences, the use of educational interventions that can generate the kinds of capacities within vocational education students and assisting students to become active and intentional learners across their working life. Educational interventions are likely to be required to address the growing elements of occupational hard-to-learn knowledge. Promoting learner agency and interdependence is likely to be an important educational outcome, not just for immediate employability, but for learning across working life.

To do this requires consideration of what constitutes the existing and emerging requirements for occupational and workplace performance and then aligning these with the kinds of curriculum and pedagogic practices that vocational education institutions need to advance and the kinds and quality of engagement that students need to adopt and practice. These concerns are not just about individuals' personal learning: they extend to the efficacy of work practices, workplaces and communities.

In all, educational goals and processes are needed for developing adaptive capacities on the occupational plane (e.g., informed principles and practices) and active and intentional learning on the personal epistemological plane. It is these kinds of curriculum, pedagogic and personal concerns that may be effective in securing the kinds of outcomes required for vocational education provisions, whether in schools or colleges, to be responsive to the emerging occupational and workplace requirements often referred to as 21st-century work requirements.

Definition of internships

Within an educational context, Internships, co-ops and work experiences (hereafter: Internships) represent workplace-based learning experiences that develop, extend and apply participants contextualized skills and knowledge. Internships are conceptually embedded within the larger field. Internships represent a sub-category of Work-Integrated Learning because they generally involve the “placement” of a participant within a placement organization for the purpose of undertaking a specific learning experience (Bayerlein et al., 2021b).

The scale (for example measured in hours of commitment per time period), duration and income generation potential of Internships may vary considerably between different placements, industries and contexts. Similarly, the nomenclature used to describe workplace-based learning experiences, including the terms Internships, co-ops and work experiences, may vary in their definition across different contexts (Bayerlein, 2019). To avoid confusion related to contextually dependent nomenclature, this work defines Internships through the educational “substance” that underpins particular workplace-based learning activities, rather than the “form” or “descriptor” through which these activities are operationalized. To be classed as Internships, activities require placement providers, participants and education providers to identify, and agree-upon, the learning outcomes of the Internship, the learning activities through which learning outcomes are to be achieved, and how learning within the Internship is to be assessed (also, see: Jackson, 2015). This focus on the “substance” of the activity, evidenced through the development, implementation and assessment of a structured learning experience for participants, represents the distinguishing feature of Internships, and separates Internships from other work activities where participant learning, as well as the assurance of that learning, is absent, incidental or unstructured.

Internships in education

Governments as well as employer organizations are increasingly expecting graduates of education programs to meet a range of workplace-competence or employability criteria. This includes transferable graduate skills, such as problem solving, workplace agility and the ability to undertake work independently with minimal direct supervision, as well as occupation specific skills related to frameworks, processes and systems that are used within a particular occupation. The growing importance of the graduate skills and knowledge that are associated with workplace-readiness has been recognized in the literature for some time (for example, see: Arum and Roksa, 2011; Jackson et al., 2014; Rosenberg et al., 2012). Despite this recognition, providers of education programs have received persistent criticism for producing graduates that appear inadequately prepared for the world of work (for example, see: Coll and Zegwaard, 2006; Fleming, 2008; Jackson et al., 2017).

Internships, and Work-Integrated Learning activities more generally, are regarded as one important mechanism through which graduate workplace-readiness can be improved (Knouse and Fontenot, 2008; Silva et al., 2018; Jackson and Bridgstock, 2021). Internships are, in principle, able to support the development of learning outcomes for students in almost all discipline areas (Candy and Crebert, 1991; Maertz et al., 2014). The specific learning outcomes achieved within a particular Internship depends on the design of the placement, as well as the context in which the placement is undertaken (Jackson, 2015). However, prior literature has demonstrated a vast array of potential benefits, ranging from the general preparation of participants for the demands of a particular workplace or industry (Guile and Griffiths, 2001; Jackson, 2015; Rosenberg et al., 2012; Wilton, 2012), and the application of theoretical frameworks, process and systems knowledge in practical settings (Jackson et al., 2014; Kavanagh and Drennan, 2008), to the development of transferable conceptual graduate skills, such as problem solving, communication and agility, which are applicable across a range of occupations (Maertz et al., 2014; Orrell, 2011; Smith and Worsfold, 2015).

Practical employment focused benefits of Internships that may arise in addition to the Internship learning outcomes achieved by participants relate to increased employment opportunities (Hergert, 2009), and the ability of participants to assess their own suitability for the employer organization, industry or work-environment in which the Internship takes place (Rothman and Sisman, 2016). While it is possible for interns to attain these additional benefits, they are not integral to the Internship experience, unless they relate to a specific Internship learning outcome. In addition, recent literature (Jackson and Bridgstock, 2021) has highlighted that the attainment of improved employment opportunities through Internships, which are generated through improvements in industry networks, requires the explicit integration of activities that support such an outcome in the Internship.

Internships that require participants to undertake real-world work placements within a placement organization, and physically attend a particular placement location for extensive face-to-face on-site interactions between Internship participants and other employees, have traditionally been the most common Internship format (Bayerlein and Jeske, 2018b). The success of such Internships is well documented, and their benefits are widely accepted by education providers and employers across numerous occupations (Maertz et al., 2014; Kraft et al., 2019). However, in recent years Internship practitioners and researchers have increasingly noted the challenges associated with traditional Internships, including the location-boundedness (Bayerlein and Jeske, 2018a,b), limited accessibility (Maertz et al., 2014; Kraft et al., 2019) and limited availability (Maertz et al., 2014) of internships, as well as the potential benefits resulting from the application of new technologies and innovative Internship concepts. As a result, alternative ways to structure and implement Internships, and Work-Integrated Learning activities more generally, have gained substantial interest in the literature (Kay et al., 2019; Silva et al., 2018; Bayerlein et al., 2021b). Assessments of innovative Internship concepts have highlighted that such Internship formats should principally be able to generate learning outcomes that are comparable to traditional Internships (Bayerlein and Jeske, 2018b; Zegwaard and Rowe, 2019), while addressing some of the major accessibility and relevance concerns surrounding traditional Internship activities (Perkiss et al., 2019; Bayerlein, 2015; Bayerlein and Jeske, 2018a). However, empirical evidence that evaluates the participant learning outcomes of different emerging Internship (for example see: Bayerlein, 2020) and Work-Integrated Learning (for example, see: Perkiss et al., 2020; Wersun et al., 2019) formats remain limited.

Identification and attainment of learning outcomes

Regardless of the format through which Internships and Work-Integrated Learning is delivered to participants, the mechanisms through which Internships create benefits for participants are similar in all contexts. The employed mechanisms revolve around the integration of participants in work environments, as well as the provision of deliberate support structures by education providers and internship providers to onboard, support and exit participants from the learning activity. The creation of learning outcomes for Internship participants, which represent the focus of the participant experience, may be viewed through a variety of lenses, which are linked to the intentions that underpin a particular Internship program or opportunity. All Internship activities require an inherent focus on attaining an identified, and agreed-upon, set of participant learning outcomes (Jackson, 2015). Despite this commonality, individual Internships may be underpinned by differing intentions, including the improvement of participants generalist workplace competencies (Prikshtat et al., 2019), or occupation, profession or employer organization specific employability skills (Gardner and Liu, 1997).
